PLANTING OPINION.

A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

OL. VI.] MADRAS, SATURDAY, JANUARY 5, 1901. [

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, ie 11th instant. Season reports should be sent direct to ie Printers, Messrs. HIGGINBOTHAM & Co.

Coorg.

POLLI BETTA, Xmas Day.—*Weather.*—Mostly cloudy. Some very hreatening looking clouds last evening. Nothing came of hem, however. It is just comfortably cool now, without eing chill. *Crop.*—Contract picking progressing favourably. Crops better than it was supposed they would be. Last lossom time seems to have been a good season. *Labour.*—ufficient. *Health.*—A number of cases of fever prevalent. *Prices of grains.*—There has been some easement in prices.

IN THE TWENTIETH CENTURY.

ONLY during the last quarter of the Nineteenth Century ave British-grown Teas made great progress; during the ame period British-grown Coffee has, we regret to say, ade no advance in competition with Brazilian and other oreign sorts. There have been forward movements in regard o Pepper and some other products; Cinchona has latterly xhibited fairer prospects. Yet, on the whole, the curtain rings own on the old century amidst a dulness and depression mong Indian planting products that almost appals the bserver interested in the welfare of the planting industry. Vith but one or two exceptions—and these relating perhaps ore to native-grown products than to those cultivated by he European planter—prices are low, so low that there is but ttle inducement to the grower of products that appear to be verywhere in over-supply. Tea has shown a bad average ately. In a measure, this may be attributed to the presence i the market of an unusually large proportion of low sorts; ut that does not explain the whole reduction in price. Supply as increased more rapidly than demand. Part of the proceeds of sales has been expended in trying to develop old and up new markets. The effort has been attended with so success; but consumption has not overtaken production, and the general level of prices has fallen. China's competition has been met successfully, yet is still strong, while in Japan there is as much activity and enthusiasm as in Ceylon, and in various markets Japan teas have to be reckoned with as formidable rivals. The century closes at a moment of depression, yet, as regards Tea at least, it may still be said that there is hope of a recovery, and there is, in very many instances, a profit still being reaped from it.

The position in regard to South Indian Coffee is very different. Put aside a few well known marks, a few that have made for themselves a special market or are steadily taken off by the same dealers year after year, and what remains? A succession of low prices, lower of late. Moreover, we fear that Indian Coffee has lost some of its old prestige; and we would even go the length of saying that in some markets—such for instance, as the United States—it has never acquired the prestige that is its due. This must be largely attributed to unfortunate circumstances that tie the hands of many coffee-planters in India. It is partly due, however, to a deficiency of enterprise. A few days ago, one of our subscribers wrote us remarking that *Planting Opinion* had become more of a Tea than a Coffee organ. For some weeks past, true. But why? A few months ago we ran Coffee, and Tea had to take a back seat for a time. Latterly, tea-planters have been all alive. British-grown teas have been spoken of and written about in all parts of the Empire. There has been a little war between dealers and importers in England, another in regard to warehouse rates, etc. There has been discussion of quality, and packing, and railway and steam freights. A suggestion that green tea should receive more attention and black less, has caused a lengthy controversy in the newspapers. Every paper connected with planting has had to take note of these things; and, as for ourselves, Tea has necessarily pushed Coffee into a corner for a time: not through any desire of ours, but for the simple reason that tea-men have been awake, while coffee-men have been sleeping.

Impartial critics will, we think, admit that this state of affairs was foreshadowed months ago in the columns of this paper. We have repeatedly warned coffee-planters of the need for following similar tactics to those adopted by their

Tea rivals: the development of old markets, the opening out of new; the advertising of Indian coffee, so that it may make a firm stand against its foreign competitors. How little effect our words had for a long time is well known. Recently, the word has been taken up by some of the leading men of the community—Tea-men as well as Coffee—and the new century opens at a time when there is reasonable ground for the hope that Coffee-men mean to bestir themselves at last. Our remarks from time to time, the notes we make, and the extracts we take from other papers, must be mainly influenced by what is going on around us, not by what we think ought to be going on. If there be a boom in Coffee, or a strong effort to push it ahead of Tea, our pages will soon occupy themselves more with Coffee than they have done just lately. Coffee-planters can help us at all " if they have the will. Meanwhile, we wish all planters " Co. Prosperous New Year, and we venture to express the " hat Indian products will make great progress during " Century that has just opened. For Tea, Coffee, Pepper, " Cona, Cardamoms and Ginger, not to speak of several " products that are under trial, there is hope, provided " ose concerned work vigorously and do not neglect the lesson caught in the fable of the Bundle of Faggots.

A TANJORE ENTERPRISE.

We would call our readers' special attention to an advertisement in our present issue relative to the Tanjore 4 per cent. Railway Loan, for which tenders are invited by the District Board of that place. It may be, in these days of depression, that few planters have funds to spare for investments of the kind referred to. Yet the enterprise is one that deserves strong support, not only because of its intrinsic merits, but because it inaugurates what we trust will prove to be a new era in local enterprise in Southern India. Tanjore is bound to succeed with its Railway, and its success should encourage District Boards elsewhere to follow an admirable example. There is no reason why something of the same kind as Tanjore has undertaken should not be done in various planting centres which are greatly in need of improved communication. The District Board has made an excellent move in declaring its readiness to receive and consider on their merits offers to exchange Government 3½ per cent. paper for its 4 per cent. Debentures. By this arrangement the investor will be saved the trouble and expense of selling out his stock in the way of brokerage, commission, etc. He will also receive a readily saleable security in exchange for one that must at present be regarded as difficult to dispose of. No doubt the 3½% loan is payable at par in 1904, but it may not then be practicable to obtain as safe and profitable an investment as that which now offers. We would also specially point out that to investors who so desire the half-yearly interest and the final discharge of the Debenture Bond will be remitted free of cost by means of Remittance Transfer Receipts on any Government Treasury in the Madras Presidency. This is a convenience that will be widely appreciated in the Mofussil. The fame of the Tanjore Bull is world-wide, and we trust that "bull" influences will be appropriately brought to bear in the floating of the loan under reference, and afterwards with respect to the debentures.

BOARD OF TRADE RETURNS.

NOVEMBER, 1900.

The following figures are taken from the official t showing the imports, consumption, and exports o undermentioned articles for the eleven months ending ember 30, in the present and two previous years, com from the Board of Trade Returns, with stock in U. K November 30 :—

Coffee.—Imports reduced, home consumption incre The falling-off in exports puts stock on almost the old l representing about six months' supply for home and exp

—		1898.	1899.	190
Import	cwts.	900,857	974,072	734

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nic son's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf pe unable to procure the Ear Drums, may have them free.

Address—No. 989 D, THE NICHOLSON INSTITUTE, Longcott, Gunnersbur *Lon*

[w. 26-5-00—26-5-1901.]

THE BRITISH TEA DUTY.

At a meeting of the Planters' Association of Ceylon at Kandy, on the 29th ultimo, the following resolution was unanimously adopted :—

That this Association would urge on Her Majesty's Government a reduction, at as early a date as is compatible with the financial needs of the Empire, of the import duty on tea in Great Britain, which is now equal to nearly 100 per cent. *ad valorem*, whereby consumption is checked, and the stability of the tea planting enterprise in this colony seriously threatened.

The resolution is discreetly worded. From motives of loyalty, the planting community abstained from offering strong opposition to the recent enhancement of the British tea duty ; from motives of policy they have now to put on record their opinion that that duty ought to be reduced "at as early a date as is compatible with the financial needs of the Empire" This will prevent any future Chancellor of the Exchequer from representing that the Government was never informed by planters of the need for a reduction. We trust that the Indian planters will join in and support Ceylon. It is pleasing to note that just while representations are being made anent the British duty, similar representations are being made also in the United States. There, however, abolition of the 10-cents duty is asked for. We trust it may be obtained ; but fear that there also delay will be unavoidable.

U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

The General Committee of the Indian Tea Association, Calcutta, states in its Monthly Return of Sailings and Daily Customs Entries of Tea from Calcutta, and of Exports of Ceylon Tea for four years up to 3rd December, 1900 :—

Exports of Indian Tea from Calcutta.

NOTES.

Coffee in London. Prices unchanged—Mysore B. 57s.

Cinchona in London. Cable advices report a flat market. Price per unit 1⅜d. Stock 10,000 packages.

Rubbishy Tea. The best prices lately offered in London for some of the rubbish shipped home as Tea was 1½d to 2d. per lb.

Ceylon Green Tea Grant (New Scheme). The total amount of Ceylon Green Teas on which the Grant was paid up to the 14th ultimo was 224,342 lbs., leaving 775,657 lbs. still available for Grant.

Tea in the U. K. A recent return by the Board of Trade to the House of Commons shows that England now drinks more tea than all the other European countries and the United States put together.

Tea growing in Victoria. The *Sydney Herald* of December 4th says :—"It is the intention of the Minister of Agriculture to test the suitability of Victoria for

* It is understood that the bulk of this tea consists of transhipments for the United States and Canada.

growing tea, and an application will be made to the Indian Government for a small quantity of seed."

Rubbishy Teas. The Ceylon Chamber of Commerce has taken up the recent remark of the *Globe*, about certain alleged rubbishy teas. The Chamber's letter to the Bengal Chamber of Commerce is given in our present issue and deserves to be studied.

Java Cinchona. The exports of Java bark for November were 1,490,000 Amsterdam lbs. against 1,362,000 Amsterdam lbs. last year, and 1,220,000 Amsterdam lbs. in 1898. The total for the eleven months is 9,533,600 Amsterdam lbs., against 10,764,000 Amsterdam lbs. last year, and 10,115,000 Amsterdam lbs. in 1898.

Coffee in the U. S. Sales on the Pacific Coast to end of October, as reported by Mr. C. E. Bickford, were 147,251 bags, against 152,283 bags last year. Stock of Central American in first hands, November 7,13,072 bags, of which 9,731 bags were Guatemala. Strictly good Guatemala, 12c.; good unwashed Salvador, 10½c.; good Costa Rica, 11¾c.

Japan Tea in the U. S. Shipments of tea from Yokohama and Kobe, season 1900, were 32,806,295 pounds to and including October 14, against 35,523,512 pounds same time in 1899. Total settlements to October 22, were 302,314 piculs; same time, 1899, 327,161 piculs. Stocks, October 22, 3,187 piculs, against 9,394 piculs same time 1899.

Colombo Tea Sales. At the sale on 19th ultimo about 14,746 pkgs.=1,071,447 lbs. were offered, of which about 8,392 pkgs.=544,528 lbs. were sold. Prices were very irregular, and buyers showed a disinclination to operate. The quality of many of the teas offering is still very inferior, though a slight improvement was noticeable from not a few estates.

Phosphates in Christmas Island. Sir John Murray, K.C.B., is exporting phosphates from his 100-year-lease property, Christmas Island, there being great deposits there. He proposes to open up the island agriculturally in due time, and, no doubt, his recent visits to Ceylon and India are in connection with the supply of these phosphates to various markets.

The French Tariff. "The enhancement of the French Import duties on Indian coffee, pepper, etc., has been postponed for six months till the end of June, 1901." This is the latest announcement. The contradictory pieces of information that have been received lately are very puzzling; but, at any rate, there is to be no change in the French Import Tariff on tea, coffee, etc., just at present.

The Tea Duty in the U. S. The tea trade in America is about to take active steps to have the 10 cents duty on tea removed. The *American Grocer* remarks:—"It ought never to have gone on, unless with coffee, and as a war tax, to be removed at the earliest possible moment." The Philadelphia importers are moving in the matter, and have appealed to the National Board of Trade and Transportation for aid.

Coffee in Sao Paolo. The *Brazilian Review* of 13th N ember, 1900, states:—This y coffee crop in São Manoel do Paraiso is reported to greatly exceeded its estimated yield of 37,500 kilos. while flowering promises a larger crop still, next year. In Carlos do Pinhal the prospects of the future crop have su ed from the southerly winds lately prevailing. A co cleaning mill in Bello Monte has been destroyed by fire.

The Amsterdam Cinchona Auctions. At the December auction, the was divided as follows:—*Succiru* 89,948 kilogrammes; *Ledgeri* 498,776 kilagrommes; *Hybrid* and other kinds, 88,693 k grammes. Of the total thus formed, root bark for 76,764 kilogrammes. The richest parcel of bark consiste 9 bales of *Ledgeriana*, which contained an equivalen 9·94 per cent. of sulphate of quinine.

Tea Exports from India. The exports of tea from I from 1st April up to December to the United Kingdom total 137½ millions lbs., and t other Countries 19½ millions lb. The comparison with vious years is as follows:—

1st April to 17th Dec.	To U.K.	To all other Countries.	Tota
1900 ...	137,500,000	19,500,000	157,000
1899 ...	130,802,934	17,650,086	148,453
1898 ...	116,587,565	13,420,240	130,007

Coffee in Tonkin. The Planters' Association, of Ton recently discussed the question coffee cultivation in that quarter. Enterprise there is, the *China Overland Trade Report*, that line is still in an exp mental stage. The best soil and climate for coffee in region remain still to be ascertained. The plantations sta have met with small success. One main drawback to en prise lies in the prevalence of typhoons. The climat Cochin-China has been found to be too damp for Arab coffee, but the Liberian kind thrives there, On the o hand, the Arabian berry takes readily to the dry climat Tonkin.

London Tea Sales. A telegram dated 20th ultimo, f Messrs. Gow, Wilson and Stan reports that the market generally was weak. The price fair liquoring Ceylon Pekoe Souchong was 5½d (same as previous week), and the average price of Ceylon tea sold garden account was 7⅛d. (a farthing down), as against and 7⅞d. respectively in the corresponding week last y *Reuter* reports good to fine Ceylon tea firm, and commo medium rather easier: 30,000 packages of Ceylon tea offered for sale, of which 26,000 were disposed of; whil the 43,000 packages of Indian Tea offered, only 333, found purchasers.

A Botanical Acquisition. Botanists will be interested to l that the important cryptogamic barium of M. Bescherelle, a well-known French bota has just been acquired by purchase for the Departmen Botany in the British Museum. This herbarium, whic one of the most complete of its kind in the world, con chiefly of mosses, lichens and liverworts, collected in g part in the French colonies, where M. Bescherelle has p tically had a monopoly in this respect for the last thirty ye The *Manchester Guardian* understands that there are 15

ecimens of mosses, and nearly 4,000 specimens of liverworts this fine collection.

---

e Advantages of Forestry.

"It is now universally acknowledged that the system of forest management which had its origin, and is en to this day chiefly, if not almost exclusively, carried out the Continent of Europe, has passed beyond the experiental stage, and has fully justified its claim to be regarded at once thoroughly scientific and eminently practical." says the *Timber News*, adding that as the secret of the stem's success lies largely, if not wholly, in the fact that hough men may come and men may go" the system "goes for ever," the primary cause of that success must be ught in the systematic forest training, which, with the oroughness which is characteristic of the German nation, s been provided by State institutions throughout that untry.

---

xperiments with Manures.

The Cylinder Method is used quite extensively at New Jersey experiment station to compare the action of rious fertilizers upon different crops. The cylinders are iron or earthenware, about 1 ft. in diameter and 3 ft. deep. ney are set in the ground level with the surface. By this ethod the fertilizers can be applied with great exactness and e conditions kept under control. At present there are 120 linders in use to determine the effect of chemical nitrates s compared with or ganic nitrates, that is to say, nitrogen rived from manures. Pot experiments are another novelty. ne earthenware pots of uniform size are kept on a large ck on wheels so that the whole apparatus can be moved out doors on suitable days and moved back into greenhouses hen the weather is unfavourable. In this way uniform nditions can be secured for a long period of time. This is plan of experiment derived from the German experiment rms, and is being tried also at the experiment station in ass. and in other States.

---

lcutta Tea Sales.

About 17,000 packages were printed for the Calcutta Tea Sale of 21st timo, of which 14,500 were sold, and 2,500 withdrawn, or gistered. There is little change to report in the market, ood teas, with point and flavour, being wanted at fair alues; while "coarse plucking" rubbish is almost unsaleble at any price. The bidding for some Pekoes of this class ll as low as seven pice per lb., and not wanted at that. ny parcels with flavour and quality did well. This was the osing auction of the year, the next sale being fixed for riday, 4th January, 1901. It is more than likely, says the *ndian Daily News*, "that the market will open very firm fter the Christmas holidays for good teas. Such are wanted, nd will be paid for, but there seems no prospect of improvement for the rubbish before referred to. Without exaggeraon, some of the stuff offered yesterday as tea is not worthy the name, and it is, perhaps, a good thing for the industry enerally, that the price, now obtainable for such, shows a eavy loss on bare cost of production."

---

msterdam Bark Sales.

The Amsterdam correspondent of the *Chemist and Druggist* telegraphed 6th ultimo:—There were added to the auctions held here -day, a further 314 bales (23,042 kilos.) of Java bark, containing 1,000 kilos. of quinine sulphate, so that the total amount catalogued was 7,396 bales, 8 baskets, and 247 cases containing 677,417 kilos., representing an equivalent of 33,221 kilos. quinine sulphate, of which 91,588 kilos. were druggists' bark (2,245 kilos. q.s.) and 585,829 kilos. manufacturing bark (30,976 kilos. q.s.), with an average percentage for the manufacturing bark of 5·29 per cent., against 5·39 per cent. for the November auctions, and an average of 5·38 per cent. for the ten Amsterdam auctions of 1899. Of the above 7,651 packages offered, 7,645 packages were sold at an average unit of 8c. per ½ kilo. against 10·90c. per ½ kilo. paid at the November auction. The following were the approximate quantities of quinine purchased by the principal buyers:—English and American factories, who purchased the equivalent of 10,630 kilos.; the Brunswick factory, 7,412 kilos.; the Mannheim and Amsterdam factories, 7,938 kilos.; the Frankfort-on-Main and Stuttgart factories, 4,316 kilos.; and various buyers, 2,913 kilos. The prices paid for the manufacturing-bark ranged from 8¼c. to 80½c. per ½ kilo.; and for druggists'-bark from 8¼c. to 43¾c. per ½ kilo. The tone was steady at the decline.

Notes from the Straits.

Mr. Stanley Arden, recently appointed Superintendent of Government Experimental Plantations in the Federated Malay States, wrote lately to a friend in Ceylon:—"Since my arrival, my time has been taken up with travelling in this and the neighbouring States, so as to gain a knowledge of the chief requirements of local agriculture. Everywhere, I have been, coffee is by far the largest crop grown. Its cultivation, however, is being gradually abandoned, not by any means on account of disease, but because of low-prices. Many planters go in largely for rubber planting, which with coconut cultivation is well suited to large portions of land here. In many cases rubber *Hevea* and coconuts may be seen planted among the coffee, thus ousting the latter as did cinchona and tea in Ceylon. Tea would no doubt grow well here on the higher lands, but evidently the present price of labour would not make its cultivation profitable. The Agricultural labourers are nearly all Tamils imported from India, the natives being quite in the shade and devote their time to fishing, boating and other indolent pursuits." Under date, 12th December, Mr. Stanley Arden writes:—"I have been touring ever since I reached the Federal Malay States, and consequently have got a fair knowledge of the country and agriculture generally. The 'Para' Rubber out here is looking very well and in a few years Coffee will be a thing of the past. Most planters are planting in 'Para' and Coconuts among the Coffee, so that the latter will soon be almost entirely supplanted. 'Rambong' (Gutta Percha?) is also doing very well with us."

LETTERS TO THE EDITOR.

FOXEY COFFEE

DEAR SIR,—Can you, or any of your numerous readers, very kindly give me any information as to the cause of foxiness in coffee, and suggest any possible cure? Are you aware of any books or pamphlets dealing with this subject?

PERCY G. TIPPING.

[We trust that some of our readers will give their opinions on this subject, though it is one that has been much discussed in the past.—ED., *P O.*]

GENERAL ARTICLES.

BRAZILIAN NOTES.

(From the *Brazilian Review.*)

Money and Exchange.—*Rio, 10th November*, 1900.—Ninety days' rate on London opened on Monday at 10½d. rose to 10 25/32 on Tuesday and closed to-day at 10 7/16 and 10 15/32d.

The re-appearance of the Bank of the Republic, which re-opened its doors on Monday last, under the auspices of the new management was the signal for quite a little flutter in the exchange market that succeeded in pushing the rate to 10 25/32d. So far as we can judge the methods of the *Republica* under Government direction are not very different from those of other banks. to make money out of exchange, honestly if they can, without too curious enquiries as to buyers or sellers or bothering about committentes or anything else. Nor could anything else be expected; for can the Etheopian change his skin or the leopard his spots, except by moving, like Mr. Petersen, from one to another? Never. As a sample of what the *Republica* could do if it chose, a rise of ½d. would have been satisfactory enough had not the rate relapsed again almost to starting point. The market evidently was not yet ready for a bull movement, ready bills being particularly scarce last week, in consequence of the dull coffee market. sales at Rio and Santos only amounting to 107,000 bags compared with 222,000 the previous week and an average of 180,000 per week ever since the 1st July. The value of the coffee "sailed" during the week from Rio and Santos amounted to only £265,951 compared with £762,885 the previous week; this brings the total value since the 1st July up to £9,091,160 as against £6,646,447 last year. Taking the quantity remaining to be shipped up to 31st December at the same figure as last year's the value will be about £4,000,000, making with the rubber, that is expected in large quantities this month, a total value of about £7,000,000. . . .

Home office and Branches, and as most of the exchange must have been taken here or at Santos it seems probable that the real requirements of the market will not exceed 1 1/2 million sterling per month. At that rate coffee and rubber bills together will be more than sufficient during the next two months to not only supply all market requirements but to liquidate the whole of the debit to Home Office and start a new "bull" deal with the balance, as last year, if anyone have the courage enough to do so at the tail end of the season. What the *Republica* should do, is to provide for the lean months, when there is little coffee left and we are wholly dependent on rubber bills, by buying now to sell again in February or March. That would be far more useful and advantageous to the market than pushing rates up and letting them drop again, however profitable it may be to the Bank. . . .

The market clearly does not want all the bills that coffee and rubber can supply during the next two months; and if the balance is not absorbed by the Banks for liquidation purposes an advance of rates seems unavoidable.

Rio, November 17th, 1900.—Ninety days' rate on London opened on Monday, 12th at 10 15/32d. and closed this evening at 10 1/2d.

The tendency during the week has been towards steadiness if not decidedly upward, to which no doubt heavy coffee sales, over 200,000 bags at Rio and Santos during the past week, powerfully contributed on the one hand, whilst the slump in foreign prices took the heart out of the market on the other. Although the present fall seems too sudden to be wholly natural, it seems as if we are again in for a steady decline to 8$000. As, however, that rate may be looked on as the minimum at which coffee can be marketed, whatever exchange go to, it will not much matter to farmers, as with the prospect of over-supply next year, the minimum is certain to be maintained and in that case, as it cannot hurt coffee anyhow, the higher exchange go the better for other interests. Supposing 9$000 be reached on the present basis of 10 1/2d the f.o.b value would work out at about 36$000 per bag and would give for a crop of 12,000,000 bags about £21,000,000 as against some £18,000,000 for the current crop. What seems requisite is to let coffee slide and look after exchange; otherwise, one must react on the other and carry rates down again as in 1897. If exchange instead of falling were to rise, although the currency value of coffee would be smaller than this year's its sterling equivalent would be greater, as it is improbable that local prices can be pushed below 8$000 to 9$000 per arroba.

The prospect of exchange next year depends greatly on the steps taken to anticipate the almost certain bear movement that will e should the coming crop prove as large as is generally anticipa

In January next 25% instead of 15% of duties will be paid in and remitted, tending therefore to depress rates, against wi however, must be placed smaller imports than last year and b coffee values. There seems good reason, therefore, to expect a st or rising rate especially as rubber is late this year and will, there last longer. About March, however, if the rumours of a monster be confirmed, houses will commence selling coffee and excha ahead and the latter may be expected to boom until about when covering will begin. Unless some provision have been viously made by the Bancoda Republica it is certain that a for able bear movement will result when shippers' hands are full of to play with for months ahead and coffee prices probably falling There are only two alternatives to follow in such a dilemma burn paper money wholesale about June next year, or for the b to be prepared to draw liberally and lock up the paper to sus the rate. Unless something is done coffee prices will be fo down to the minimum of 8$000 or less and exchange follow Naturally all this will be put down to the renewal of sp payments; but forewarned is forearmed. Unless something done it matters little whether specie payments of the debt renewed or no, exchange will fall next year if coffee entries re 11,000,000 or 12,000,000 bags, as is anticipated.

Rubber is now coming-in in earnest and within a short time l from the north will be plentiful. The value of coffee sailed dur the past week was £503,875 as against £264,153 the previous we Up to 16th instant the value sailed since 1st July amounted £9,672,712 as against £7,048,183 last year.

There seems little expectation of a boom in imports next mon such as occurred the last two years and that the course of payme will not next year be disturbed by being concentrated in the quarter as in 1899 and 1898. The action of the Bancoda Repub as a controlling factor in the exchange market has been already though we trust the management will give more attention to problem of maintaining stability of exchange than merely mak money. Unless something is done to steady exchange next Spr all the profits of the Bank will not make up for the certain loss slump to 7d or 8d.

Coffee.—Entries during the week ended 9th instant, took anot spurt, being 59,571 over those of the previous week and 54,214 m than during the corresponding week last year, the increase be exclusively at Santos. Whether or no such large entries can be k up is much debated, some stating that coffee is being held b and others that is has been pushed forward.

Anyhow it is reasonable now to expect some falling off, wee entries after this date to the close of last year having rarely rea ed 200,000 and only exceeded that figure on three occasions.

Crop entries up to the 9th instant show an excess of 119.181 co pared with the previous year, entries at Rio being 351,212 bags l and at Santos 480,393 bags more than last year's.

Santos, Nov. 10th, 1900.—A sudden and unexpected change the fall set in during the week under review; it was so irresisti that neither dealers nor exporters could do anything to stem it, t reasons given are too large receipts and absence of orders from co suming quarters. We quote 6$600 to 7$ for *superior*. The form price was reached yesterday, Friday, when the market showed desolate appearance, to day, however, better feeling is coming assisted by a lower rate of exchange and a few orders from consu ing quarters, but whether this improvement can be kept up gain in strength, will depend very much on orders from the oth side and the necessity of dealers to sell. In absence of orders the was no special demand and whatever changed hands was cheap a therefore, bought on this merit only. Arrivals are still large, esp cially from the Sorocabana which figures in the daily receipts wi about 7,000 to 8,000 bags. On account of this there is a decid falling off in quality and more hard dark coffees are for sale. Shi ments still keep up fairly well with arrivals and stock here do not show any increase so far. With regard to the next crop heard from some districts that heavy winds, which were al experienced here at the coast, did damage, tearing off the prima fruit. How far the damage goes cannot be ascertained as al gether from January onward a safer opinion can be formed abo the probable outturn. There were orders here from Europe f *Good Average* at 36s. to 36s. 6d. and for *Superior* at 37s to 37s. but we do not know of any acceptances. These qualities stand here at about one shilling higher.

Another correspondent writes from Santos "Commissarios are ery bullish, but exchange is sickening them a bit as they are holding far too much coffee and have allowed clients up-country to hold o much likewise, fully 40,000 bags being held back from here. he current crop is far from finished yet and estimates will, I elieve, prove to have been far too low, whilst the coming crop is rward and promising to be a "whopper." If, too, coffee is being eld back at Rio, as some believe, unless prices advance abroad, of hich there seems little chance, sentiment will not be strong ough to keep prices up and, with a dragging market, lots of weak olders will be obliged to realise and pull prices down. For the oment, however, exchange stops the way."

São Paulo.—The flowering in the coffee plantations about Itapira very fine, and, should weather continue favourable, a full crop ay be looked for.

Heavy rain has fallen in Amparo during the last week. Ribeio Preto has also experienced a streak of bad weather.

Heavy rains have fallen in S. Roque.

In Cabreuva this year's coffee crop has yielded 25,000 bags, and is expected that next year's (1901) will be 50 % larger.

Boa Vista das Pedras has yielded a coffee crop of 7,500 bags stead of only 5,000, as estimated. It is expected, from the appearnce of the trees, that next year's crop will be double or treble e former figure.

On 14th instant, a formidable circular storm struck a place called osse near Mogy-mirim and caused great damage, houses being nroofed, trees blown down, and plantations and labourers' cotges destroyed.

Entries at Rio and Santos during the week ended 16th instant, ow a falling off of 48,889 bags compared with the previous week, ut are still 55,855 bags in excess of those of the corresponding eek last year. Up to the 16th instant the total entries at Rio and antos exceeded those on the same date of last year by 185,036 or out 3.3% and, should they continue on the same scale, total ntries for the current crop will reach 9,300,000 bags exclusive of ictoria and Bahia.

A correspondent writing from Porto Novo da Cunha, in Minas eraes, says that in the Rio Pardo, Aventureiro, S. Domingos, Anustura, Forte, and Leopoldina circumscriptions, at least 9/10ths of e crop has been already marketed, planters being too hard pressd to hold their coffees long. The flowering in these districts has een excellent, and berry is already well advanced and only very d weather early next year can prevent the yield being very large, rhaps twice the current crop.

PLANTERS AND SCIENCE.

Considerable interest attaches to the formation of a certain ew Planters' Society, details of which are given by *The lanter* as follows :—

At a meeting held at Luskerpore on the 10th instant, at which e following gentlemen were present, Messrs. Lennox, Aird, utherland, Sanderson, Alston, Campbell Ekins, Kilgour, Crawford d McLauchlin, it was proposed to form a Society in this district r the exchange of ideas, and generally for the advancement of ofessional knowledge.

Doctor Sutherland being called to the Chair, the following rules ere formulated and agreed to :—

CONSTITUTION.

The objects of the Society are to form in the district a regularly nstituted body of planters and others interested in tea culture, ho may take cognizance of, discuss and take steps in regard to any ofessional matters which possess general scientific interest apart om the objects of the Indian Tea Association and its branches, d also by discussion, reading of papers and other means to further e dissemination of professional knowledge.

RULES.

(1). The name of the Society shall be the Luskerpore Valley Society of anters.

(2). All residents in the Habiganj Sub-division shall be eligible as embers of the Society.

(3). The management of the Society shall be vested in a Committee mposed of a President, Honoray Secretary and three members, who all have power to manage and dispose of funds. Three to form a quorum. the absence of President the meeting will elect a Chairman.

(4). Every candidate for membership must be proposed by a member of the Society and seconded by another, and balloted for at the next ordinary meeting.

(5). The annual subscription shall be Rs. 2 and no member shall be allowed to vote at any meeting unless his subscription for the current year has been previously paid

(6). A general meeting shall be held annually in January or as soon after as possible, on such date as the Committee may decide, to receive the annual report of the Committee, the Statement of Secretary's Accounts made up to 31st December, to elect a Committee for the year and to discuss any other business of the Society.

(7). The Committee may convene a special general meeting of the members at any time and shall do so on a requisition signed by at least five members, stating the subject to be submitted for consideration.

(8). The rules of the Society may be added to, altered or amended at any ordinary or special meeting of the Society, provided that not less than half the total number of nembers are present and that notice has been given in writing to the Honorary Secretary at least three weeks before date of meeting. The Honorary Secretary, on receipt of such notification, shall lay the proposed alteration before the Committee, who shall place the matter before the members in such manner as may appear most suitable.

(9). Any member may introduce a friend to the ordinary meetings of the Society, but said friend may not be present during the transaction of private business.

(10). There shall be no drinking during the meetings.

Every person present having entered his name as a member of the Society it was proposed by Mr. M. H. Alston and seconded by Mr. W. Lennox that Dr. Sutherland be elected President, Mr. J. E. Aird, Honorary Secretary, and Messrs. A. Campbell, G. W. Ekins and G. Crawford, members of Committee for the ensuing year.

The Chairman having read a question for discussion as to the most suitable direction in which to build withering houses, it was decided, after an interesting discussion, that with regard to the prevailing winds in this district the best position was on a line lying South-East and North-West.

With a vote of thanks to the Chair the meeting then terminated.

THE RETAIL PRICE OF JAPAN TEA IN CANADA.

The stocks of Japan tea in Canada are, says the *Canadian Grocer*, lighter this fall than they have been for some years. From the opening of the season prices of Japan tea at the primary markets have been high. This has been chiefly caused by an abnormal demand from the United States, where the heavy stocks laid in before the duty was levied three years ago have been exhausted and where a large supply is now wanted.

It has been known also that the crop would be short; and now we are assured that the shortage will amount to 10 per cent. of the total output of 40,000,000 lbs. With this contingency in view. American buyers rushed prices up at the beginning of the season, and, although there have been numerous bears, values have been well maintained.

In Canada, particularly, has the bearish attitude predominated. Dealers have refused to buy, and, in consequence, we find to-day that all stocks of Japan tea are light. To September 15, 1900, we have imported into Canada :—

	Lbs.
From Yokohama	3,191,816
From Kobe	611,132
Total ...	3,802,948
Same time last year	7,304,845
Decrease ...	3,501,897

At the same time the increase of shipments into the United States amounts to 1,835,866 lbs. over last year, and at the present moment prices are ruling 3 to 5c. higher than last year's values on medium, and good mediums.

The question is naturally asked: If American buyers were eager to buy, why did Canadian dealers not also lay in stocks? Why did they wait in a rising market till the teas were all bought and till they could be held, as they are now being held, for further advances? The answer seems to be that, at the advance, medium Japans cannot be sold at 25c. per lb. to the Canadian consumer. When mediums were worth 14c. per lb. to the jobber, as they were last year, he could wholesale them at 18c., and the retailer could sell

them at 25c. per lb., for a reasonable profit. But now these teas are worth 17 and 18c. per lb. to the wholesaler. He must sell them for 21 or 22c., and the retailer, to sell them at a profit, has to charge 30c. The difficulty is to change the retail price from 25 to 30c. per lb. in face of the competition with package teas. Importers would like to see it done, and it perhaps would be a good thing for all concerned, except the consumer, if it could be worked satisfactorily.

As it was last year, there was nothing in the business for the importer or the shipper from Japan. This year the Japs have refused to consign to Canada.

Canadian importers had to hold teas over from last fall to this Spring for the advance, so they are not again taking the risk this year. With this increased price assured by the sale of tea at 30c., however, it is likely they will return to the trade. At the 30c. rate there would be an increased profit of 5c. to be distributed between importer, wholesaler, and retailer.

But the difficult thing is to get 30c. Ordinarily it would be easy to advance a 25c. article 5c., but when 25c. per lb. package teas are in competition the attempt to raise the price from 25 to 30c. is a difficult matter. As yet the wholesalers and retailers have not attempted to do so, for they are still working off their old supplies, but when these are exhausted the question must be decided.

THE EXCHANGE BURDEN AND THE PLANTERS' ASSOCIATION.

Q. writes in *Capital* :—

It has been pointed out how injuriously the currency legislation acts on the industries of India. It has been shown that the buyer of rupees is manifestly burdened by the over-valuation of the article he is buying. So plain is this that the question naturally arises: How did the producer and exporter, among whom are many Englishmen of position in the country, come to take on their own shoulders without strong protest, the increased burden of the sterling debt, in other words the exchange burden?

Unfortunately for the Government of India there is practically no public opinion in the country; the loss to the Government is great, for there is no such touchstone of the value of a measure as that of the opinion of a large number of educated men of all shades of opinions and beliefs. The Government that honestly follows the evident trend of educated public opinion will not easily go astray.

But the Indian Government is denied this aid to legislation on almost every question; on the currency legislation the Government received practically no outside help at all. All rupee sellers, every one with fixed rupee incomes, saw plainly the advantage to themselves of an over-valued rupee, and saw with pleasure the *legislation taking shape*, and had no criticism to offer. And the rupee buyers failed as a body to see the great disadvantage of the measure to themselves. Why was this? Partly because the currency question has been very generally misunderstood, and partly because the question is considered so difficult to understand that few attempt to attack it. The producer's argument very generally employed for accepting the measure was this: It is better to make fewer rupees of a fixed value, than a much greater number of rupees, the purchasing of which falls continually and indefinitely. The argument for a moment seems plausible; but it is based on that widely-accepted false premises that the rupee had, up to 1893, decreased in purchasing power.

The planter then was content to buy rupees at a much greater expenditure of produce, ignoring the fact that in buying labour he could reap little or no advantage from the more costly rupee. If the different Planters' Associations had clearly recognised that the rupee artificially over-valued to the extent of 25 per cent., would require 25 per cent. more of their produce to obtain it, while at the same time this rupee was not over-valued in reference to labour, which required as many of the dearer priced rupees in its purchase as before; if they had recognised all this, if, in short, they had been what they were not, political economists, it is impossible to suppose that they would have accepted the burden almost without protest.

I do not know if I have been clear, the simplest economical statement may become confused. But no one can overlook the fact that the planter, in order to pay for labour, etc., is forced to buy coined silver with his produce, and that Government reserves to itself the monopoly of coining and selling this silver, and charges the planter 25 per cent. over and above the cost of indispensable article. In short the possessor of rupees ga the possessor of produce loses, a condition of things most injur to health in the body politic.

The producer then, as a rule, failed to understand that he about to bear the burden which Government was shifting off own shoulders; and further it is clear that the Government ne really understood on whose shoulders the burden was falling; indeed it seems possible that the Government did not realise t the burden, which it was getting rid of, was bound to be borne some one. Nor is the Government of India a body of polit economists, and it did not attempt to solve the problem itself was left to the Secretary of State to solve. How did the Secret of State attempt the solution? By putting it before a numbe accepted political economists, or by asking the advice of those had made the study of similar questions the business of their liv No; he assembled a commission, none of the members of wh had made a special study of the matter or had claims to be c sidered experts in political economy.

There is one point, in reference to the currency question, which all seem to agree; it is that it is a difficult and comp question; and, inferentially, no one but an expert can be expec to solve it. If the question had been one relating to famine, a dealing, let us say, with the action of the monsoon, the air curre of Central Africa, the set of winds in the Indian Ocean, and cyclical period of sunspots, would a commission have been appoin consisting of members none of whom had made a life long or ev a special study of these phenomena, would not the advice of perts have been sought? And yet the currency problem is behind any other in requiring expert advice to deal with it.

The fundamental mistake, indeed, all along has been to attem to decide a really knotty and important question without exp advice; hence the economical mistakes which have been made.

In maintaining this artificially over-valued currency there is on one economical question of importance to consider, but it is esse tially a question for political economists, and one of the highe importance to the country. What has been the real question co fronting Government of India for some years? It is this: He best to meet the increaseing exchange burden, the increased burde to be more exact, of the sterling debt. This burden can only met in the last resort in two ways. By reducing expenditure, by increasing taxation. The first method we assume to be i possible to employ; the increased burden can only be met then increased taxation, and how best to increase taxation in t economical question set. It has practically been answered by produce and export tax. An expert would have at once condemn it as a wholly wrong answer and as the worst possible solution the difficulty.

It is implied that the problem was attacked in 1898 by a band amateur political economists; when we come to see how t Commission of 1898 dealt with the one important question of t effects of the legislation on Indian industries, no one will cavil the implication.

CUSTOMS ANALYSIS OF TEA.

The report of the Board on the examinations made by the analyst under Section 30 of the Sale of Food and Drugs Act, 187 of imported teas before they are taken out of bound, has just bee issued. The system continues to work satisfactorily, for out 565 samples of tea examined by public analysts during 1899 onl two were found to be adulterated. The report referred to state that the total number of samples analysed during the year wa 1,544, as follows: 37 samples green tea, faced; 34 green tea, unfaced 50 green tea, capers; 671 samples black tea, congou; 678 black tea dust: 74 black tea, siftings; Total 1,544. Of the total, 1,37 samples were, on analysis, considered satisfactory, and the importa tions represented by them were accordingly delivered on th certificate of the analyst. The remaining 171 samples represente teas of doubtful character, the results of analysis of which wer reported to the Board for their decision, with results that th whole of these, representing 3,019 packages, were restricted to ex portation or for the manufacture of caffeine. It may be assume that the teas of doubtful character here referred to were not India or Ceylon.—*H. and C. Mail.*

PLANTING IN MEXICO.

An ex-Ceylon Planter has sent the following interesting ommunication to the *Tropical Agriculturist* :—

In the *T. A.* for January (which went amissing and only reached e in August) and for July, I notice a couple of letters from Mr. . O. Darley, on "Planting in Mexico," also your note on the same, sking for information *re* labour, taxes, police, etc. In the July umber, Mr. Darley has given you some information, and I now ake the liberty of supplementing the same. It must be remembered hat Mr. Darley writes from the State of Tabasco, whereas I am in he State of Oaxaca, and, therefore, my remarks and statements ostly apply to this State, and to the district I am in. But at the ame time there is little or no difference between the States as re-ards taxation, communication, etc. I have now been nearly 18 onths in Mexico, and have had ample time and opportunity for oing fully into every matter that affects planting and give my ctual experience. I may preface my remarks by stating that I as planting in Ceylon from January, 1877, to May, 1880, in dapussellawa and Maturata, and from May, 1880, to December, 898, in Johore, the Federated Malay States, and West Coast of orneo. I arrived here at the end of March, 1899.

Soil and Lay of Land.—Beyond any doubt the soil of Tropical exico is exceedingly rich and of vast extent, and, in what I may all the low country, is of a rolling character with large areas of lmost level country, generally along the rivers, and between the purs of the main ranges, these spurs generally being of limestone ormation. Taken all round, however, the country is badly atered. For instance, in the whole of this Company's lands xtending to 111,000 acres, there are three large streams, mis-alled rivers, two of which form the North, East, South, and outh-Western boundaries, one running through the centre of the lock. There are only ten other small streams running into these, nd yet our land lies at the foot of the "Sierra Madre" mountain. oil suitable for almost any kind of tropical cultivation can be urchased for from $3 to $50 the acre, anywhere in the best part f Mexico. We sold for tobacco for the latter price here.

Climate and Rainfall.—Once outside the range of yellow fever vomito" which roughly is confined to a distance of about 60 miles nland from the sea, from Tampico to Coatzacoalcos, the climate or the Tropics is remarkably good and perfectly healthy. The ainy season begins about June and ends in September, but during October to end of December there is generally a fair amount of ain. From January to May the weather is fine with occasional howers. March, April, and May are the hot months, November, December, and January the cold; and even at this elevation, 615 eet, fires are often necessary at nights, and a couple of thick lankets. The rainfall has been systematically kept only since my rrival, but commencing from 1st July, and I append it—

1899.	Inches.	Rainy days.	Heaviest fall inches
July	21·30	19	3·40
August	25·48	17	4·30
September	17·31	11	6·00
October	5·05	5	2·00
November	3·52	2	2·72
December	3·55	5	1·58
1900			
January	3·23	9	1·30
February	1·83	2	·92
March	2·04	5	·72
April	1·30	2	1·00
May	6·80	6	2·50
June	13·83	11	3·75
July	25·51	25	2·77
August	18·94	12	3·45

On the 18th February, the thermometer registered in the office 55°, Fahr., at 11-30 A.M., about the lowest it has been since my rrival.

Communication all over Mexico is by means of railway, river, and racks. Metalled or unmetalled roads outside the cities (and few even there) do not exist. The rough jungle tracks, worn down by the feet of man and animals, that were in existence in, or perhaps before, Montezuma's time, are the only ones that are available, and as these go up hill and down dale, one can fancy what the travelling s like, especially in wet weather. As far as I am aware, the Government has not even commenced to think about road-making. I will confine myself to the Railways serving the tropical portions where plantations are mostly being opened. First there is the line from Vera Cruz to Alvavado, some 40 miles. It now belongs to Sir Weetman Pearson, a bad line, badly managed. Ordinarily it takes four hours to do the journey. Another line runs from Coatzacoalcos to Salina Cruz, across the Isthmus of Tehuantepec, and a branch line from the main line to the Sanguan river. Another line is now under construction from Mozorengo to Santa Lucrecia on the Tehuantepec railway. All these are either under the management of Sir Weetman Pearson or are being constructed by him. On paper, this seems to give ample communication, but one has only to look at the map to see what a small portion it serves, especially as there are no roads to serve as feeders. The lines, too, are chiefly strategical ones, as President Diaz does not intend to allow revolutions to grow unchecked. Now as to the rivers. Stern-wheel shallow-draft steamers run all the year round from Alvavado up the Papaloaparm river to Tuxtepec from Tlacotalpam (two hours' steaming above Alvavado) up the Tesechoacan river to Tesechoacan, and during the wet season up to and a little above Playa Vicente. There is also regular steamer communication, all the year round up the San Juan river from Tlacotalpam, up the Coatzacoalcos, and some of the other rivers in the more Southern States, but how far the boats can go during wet and dry seasons I do not know. What I do believe is that these rivers only serve a small part of the lands suitable for cultivation, and here again there are no roads as feeders. In the section I am in, during the dry season, we have to depend on canoes for transport, and as the "canoeros" as a body are a drunken lot, we are at their mercy. It has often taken three months to get goods up from Tlacotalpam to where I am (just above Playa Vicente) during the dry season. Freight from Tlacotalpam to here, by canoes, is paid for by the piece of 200 lbs. and costs $28 (twenty-eight) the ton up and $17 down if you have return cargo. By steamer it costs from $28 to $31 the ton, both ways, the distance by river being about 120 miles. Freight from Tlacotalpam to Vera Cruz has to be added, but I have not the figures by me. There are besides handling and storage charges first at Playa Vicente ($12\frac{1}{2}$ cts. a package) Tlacotalpam same, perhaps at Alvavado, and finally at Vera Cruz, and I am much better off than the vast majority in this section. The freight from Vera Cruz to London is about the same as from Singapore to London. The next "revolution" has got to come from the Government in the shape of roads and by that time our grandchildren will be old men and women. Private enterprise will, most likely, have to undertake road-making, and pay Government for doing so.

Labour.—All who have gone in for Tropical Agriculture in Mexico have, with a strange unanimity, avoided this most important question and for very obvious reasons. First, the large holders have lands for sale, and soon, if I am not mistaken, the small buyers will be sorry they ever bought. There are four classes of labourers employed in estates in Mexico:—1st labourers recruited from Oaxaca, Mexico, and other cities and surrounding villages on a 3, 4, 6, or 180 days' contract; 2nd Serranos, 3rd prisoners, 4th villagers living in the vicinity of plantations. The 2nd and 4th class are by far the best labourers, but will not go far afield for work, and will only leave their villages for crop time (generally end of October to end of December). In fact, unless the estate is in the hills or near their villages, this class of labour can only be depended upon for crop, but will not stay and work steadily all the year round. The 3rd class are taken out of the prisons on payment of $5 to $10 a head, and this forms a more or less regular income to certain Government officials, not leaving out the highest in each State. This labour has to be worked literally as prisoners, and as regards treatment, wages, etc., the slave was far better off. They are generally the greatest scoundrels in a country that produces a good many. I have seen them brought up on a steamer, bound together and guarded by armed police. They are invariably locked up at nights and when not working. There is a good deal of this class of labour used on the tobacco plantations. They cost anything from $15 to $35 landed on the estate per head and work from 3 to 12 months getting 25 cts. a day and food, but in the majority of cases get nothing when leaving, and if they do have a balance are given every opportunity to abscond. Personally, I have never worked this class in any of the estates under my charge. The 1st class is the one generally employed. My experience is with Oaxaquenos chiefly. They are recruited on a "180 days' work" contract, the longest term they will agree to. This is illegal, as

according to the Mexican constitution, no Mexican can contract his time In practice the law is not enforced, but still it exists. The average advance comes to $16 for a man, and $9 for a woman, all recoverable. The recruiter gets a commission of $10 for a man and $5 for a woman which is not recoverable. Wages: men 37 cts., women 20 cts., boys and girls 10 to 15 cts., a day, with food. My average rate of wages from June, 1899, to end of August this year, works out on all the five estates under my charge to 6,518 cents per working labourer *per diem*. This includes wages, food, commission, cooks, watchmen, water-carriers, cabos (kanganies), wages, and food, and loss on absconders. *Per contra* the credit balances of absconders, are also credited to the average. Working with class Nos. 2 and 4, the average would be perhaps 5 cents less, and in the Sierras perhaps 10 to 12 cents less. Nearer the coast the average would come to about 80 cts. As to the labourer himself, I will sum up his chief characteristics—laziness, stupidity, carelessness, drunkenness, callousness, self-conceit, and an utter absence of ambition and thrift are the chief, lying and dishonesty coming a good 9th and 10th. When he first arrives, his chief idea is to abscond, but when treated fairly, he soon settles down. I am not judging him from a European standpoint, but in comparison with Tamils, Sinhalese, Chinese, Malays, Javanese, Banjarese, and Dyaks, all of whom I have worked during my 21 years in the East. As regards work; in heavy weeding, he will do about 15 per cent. more than a Tamil, but not as good work; and in clearing with the "machete," he is as good as the Malay with his "parang"; but in every other repect he is 10 to 50 per cent. behind the Tamil as regards estate work. What can be expected from labour 10 per cent. of which are field hands, and the balance loafers, gaol-birds, tradesmen, artisans, clerks, etc. No wonder they have to be constantly watched, and often as not locked up when not working and at night. Beyond weeding and using the machete, they know nothing about estate work, and by the time you have taught them something of their work, their contract is up, and away they go, and you have to begin again. By taking advantage of his thriftlessness, I have kept a good many of the best men in the place for a year by advancing them goods from the estate shop, thus keeping them in debt and raising their wage to 50 cents a day. None, however, will stay beyond the end of crop, *i.e.*, 18 months from date of contract. When they get a craving for change, nothing will keep them. Labour, such as it is, is scarce, and some Americans are beginning to introduce Chinese at a cost of $75 to $100 a head and $1 a day wages without food. In the first place they are making a mistake by getting them through the San Francisco "Societies," and unless planters and Government combine aud get Chinese direct from China, they will end by being at the mercy of the "Societies," as the Sumatran planters were; but under existing circumstances such a combination is very unlikely to come about. The present labour is bad, expensive, and insufficient, and Chinese are the only ones that can be got. My experience of 18 years with them is that they work splendidly on contract; but on day wages, are very unreliable and do as little work as they can.

Taxes.—Mr. Darley says: "Taxes are low enough." This being a country with a Protective Tariff disproves the above. The import duties are heavy, running in some cases to 75 per cent. and 100 per cent. This fact makes living expensive, even plain living. But leaving out import duties, the following are the duties we pay in this state.

Income Tax on incomes over $15 a month 4·33 per cent. per annum.

Poll Tax on labourers (recoverable) 21 cents a month, payable by estate.

Tax on Gross Sales Estate Shop 1·90 per cent. per annum.

Land Tax $13 on every $1,000 value improved or unimproved land or other property.

Property Tax (re-adjusted every five years).

Cattle Tax, if over 10 are kept for breeding purposes. I do not know the tax.

Stamps on invoices or bills, 3 cts. on every $5 (or part of $5) value of goods bought.

Stamps on Cheques 5 cts. Do. on draft or bills $100 2 cts. $500 1 ct. for every $100 or fraction.

Stamps on Ledger $14·95, cash book $9·90, Journal 75 cts. all liable to Government Examination, a very good thing too.

Legal Rate of Interest 6 per cent. The usual rate charged is 12 per cent.

Export Duties on coffee remitted, cacao nil, Rubber nil, Tobacco nil, Vanilla nil, Sugar nil, and Aguardiente, none.

Import Duty has to be paid on all Tools, Machinery, Plo Harness, Bags, (if good ones are wanted) etc., that are used estate. (See enclosed letter from Mexico Commercial Compan

Police.—I maintain that Mexico is not well policed. I excep capital, towns and large villages. The nearest village to n some 25 miles off and has two policemen. Being in Vera state, they are useless to me. The capital of this district is a 60 miles off, and takes three days, over a fearful track, to re These are the nearest police that I can call upon. Since my ar there have been four murders (two of which were by my own charged men) that I have heard of, and one arrest, and this last entirely to my action. As to minor offences, such as brutal serious assaults, no notice is taken. Prisons are an absolute grace. Hanging is not allowed and imprisonment, no disg The worst punishment is to send a man to the Army. A crim or absconding labourer has only got to get into another state is practically free from punishment and arrest. Certainly e estate can have its own police, but has to pay $20 a month per feed and house both himself and his horse.

GOVERNMENT.—As in the United States, there is no "covenan Civil Service in Mexico, but unlike the United States, thoug mock form of voting is gone through. Practically all the Go nors of the States, the Federal officials and the members of Legislature are nominated and appointed by the President, a is lucky for Mexico that President Diaz still remains at the hea affairs. I consider him the ablest man in America. Every S official is under the thumb of the Governor, and as their appo ments only rests on favour, they with few exceptions do his bidd and all hasten to make "hay while the sun shines." They ar badly paid. Each State is sub-divided into districts at the hea which is the Jéfé Politico and with him the Juez, or Judge, responsible to the Governor. Each district again is divided municipalities under an "Alcalde" and "Agente Municipal," are responsible to the Jéfé and Juez. Until we got our "Alcalde" and "Agente Municipal," whom, of course, we ha pay, we were under two Indians who could neither read nor a word of Mexican. I will give two examples of the result. of my house servants in a drunken fit, broke into the dispen and drank some carbolic acid that was in a used whiskey bo One died and was buried next day. I notified these officials three days after they came down, and I was informed by Secretary that I was liable to a heavy fine for burying him be the officials had seen the body. Backsheesh smoothed everyth Case No. 2. One of my men whilst bathingin the river was drow though his wife and several others saw what was happening never said a word or tried to help. This is not singular, for all have a dread of anything that has to do with their court justice. On Monday evening his body was found half a mile d the river and on Tuesday morning I notified the officials, lea his body where it was found. Four days after they came d only to examine a skeleton, as in the meantime the carrion e had done the work for which it is protected in this country. machinery of the law is slow beyond all imagination, and jus to quote Kipling, is "to him who holds the longer purse regards the state courts. I have had a simple case on a pro going on now for a year and we are just as we started, the J having taken one year to discover that the case was a "civil" not a "commercial" one, and there is every appearance that decision was given under instructions. The Supreme Court o Republic is, I believe, beyond reproach. I quote the words o influential and well educated Mexican merchant to me:—"I matter of justice we are far behind in Mexico, and General seems to be more bent on material progress than upon m advancement."

Products.—Cultivation as understood in the East is quite known as yet in Mexico, unless amongst the few men of Eas experience. From what I have seen, there is a want of even mentary knowledge of planting. Once the plant is planted (as not "stuck in") three to four weedings or cutting down weeds with a machete a year is all the cultivation that is g The soil and climate do the rest. This want of knowledge is in my opinion to the following causes:—1st. The want of and education amongst the vast majority of Mexican planters. The bad and costly labour. 3rd. The richness and productiv of the soil. Whether in the face of costly transport and the la conditions, cultivation will pay, remains to be proved. What know is that at the present moment there are very few so

coffee and tobacco planters in Mexico, and a large number of estates of the former have been abandoned and of the latter put out of cultivation. Estimates coming from Mexican or American sources I entirely mistrust; first, because the Mexican as a rule only calculates the amount he spends on labour, and the American estimates come from men with land to sell. Crop estimates are more reliable, but even these should be discounted considerably. I have carefully worked out the cost of properly opening, cultivating and bringing into bearing the following products under existing circumstances in this section and append the same. If I have erred at all it is on the expenditure side, as of course, every planter has his own ideas of how a work should be done. I have taken the acreage of each estate as 500 opened.

Coffee.—To bring into bearing, say 4th year $300 per acre. Returns in full bearing 8 cwts. the acre. Cost of cultivation $120 the acre. I have seen absolutely no disease.

Tobacco.—The first year will cost $15 the arroba (25 lb. Spanish) value $18 the arroba. The 2nd year will cost $10 the arroba value $20 to $25 the arroba. Only under expert management. The yield here for the 1st crop is an average 2½ arrobas per 1,000 plants. The following year 1½ to 2 arrobas. This is far under the Sumatran yield.

Rubber.— Planted 14′ ×14′ will cost to bring into bearing (*i.e.*, full 8th year) and if regularly weeded $150 the acre.

Yield 8th year 1 lb. per tree cost per acre including gathering $95.
Yield 9th year 2 lb. per tree, cost per acre including gathering $150.
Yield 10th and following year 3 lb. per tree. cost per acre including gathering $200.

Cacao. - Will cost to bring into bearing $250 the acre. Yield in full bearing 8 cwts. the acre cost $100 per acre.

Sugar and Aguardiente.—It is generally calculated that in this part the same field will go on yielding from 10 to 22 years (a pretty wide margin) and the profits range from $600 to $800 the "hectara" (2½ acres) In my opinion, as I know nothing of sugar, a good deal of salt would mix well here.

Rice Dry.—This is a crop that for years to come will pay, I believe better than any other. Very little labour is required. There is a large local demand and prices are good. Rice costs us here 12 cents the pound.

Vanilla.—This is its home but I can gather no information about it. It grows wild in the forests here, as does Rubber. On the Tobacco lands, crops of maize and beans are raised, but I do not approve of this mode. There is a large local demand for Cacao. Mexico even importing it, hence the local high prices which Mr. Darley correctly quotes. There is also a good local demand for sugar, maize, beans. and tobacco. The local demand for Augardiente is enormous as the Mexican mozo or peon cannot do without his one, two or three "copitas" (glasses) a day, and they begin drinking as children and gulp it down almost raw without a wink. It is their one remedy for almost every ill. When, however, this local demand is met, and the planter has to compete in the open markets against countries with cheaper and better labour, cheaper transport and light taxes, how will he fare? Time alone will tell. In the meantime he has magnificent soil in his favour and a large and close market in the United States and Canada. It is true Americans are rushing in and taking up large tracts of lands. There are a few exceptions, but the majority are buying only for a deal. They will dispose of these lands in small blocks to would-be planters, and I prophesy that these will be "left." What Company can deal with 100,000 acres of land and over; certainly not open it themselves? In my immediate vicinity there are 588,000 acres of magnificent land for sale. The truth is there is still a large land boom on in Mexican tropical lands and, what goes hand in hand with land booms, a plethora of exaggerated estimates like the one you published on page 36 of the July *T. A.*

Life on a Plantation.—As I have said previously, living, even of the plainest, is very expensive, unless one lives like a Mexican on dry beef, chickens, beans, rice and tortillas and coffee. If you offer a Mexican tea, he will decline saying that he is not ill. Such a thing as a good cook or house servant is not to be found in Mexico, taking the standard of up-country in Ceylon or in the Malay Peninsula. A plain cook, generally Chinese, will demand $30 to $40 a month and food and a house servant of the same nationality $20 to $30 and food and get it too. Mexican cooks (women) get $12 to $15 and food and house servants $15 to $20 and food. The Mexican servant is the most hopeless, lazy, ignorant and dirty brute I have ever come across. He has no idea of waiting, or general house work, and the cook is of the same class. Their worst point is that they will not learn, they have too much self-conceit; and if you get one who is willing to learn, they will not stay long enough to be taught, and if they do, will only learn up to a certain point. I answered a cook's advertisement in the *Mexican Herald* and enclose his reply. $100 a month and food is not bad for a "Mussleman from Conpore" calling himself "Charles Shermen."

The other delights consist of insects called "rodadores" that torment and bite one all the day and all the year round, sand flies that do the same at night during the wet season, and mosquitoes (these only bad in some places). During the dry season one cannot walk through the grass without getting covered more or less with ticks and lice. Of sport of any kind there is none, nor recreation nor society. If one is surrounded only by Mexicans, all idea of civilized society and sociability has to be given up. To compensate for the life one would have to lead, would require larger profits than I am afraid any estate would yield.

For rubber and coconuts, Mexico and adjoining countries will have a formidable rival in the Malay States where labour is from 100 to 125 per cent cheaper and far and away better, transport better and cheaper by at least 100 per cent, taxes 2½ per cent *ad valorem* duty on produce. Anyone thinking of investing in Mexico, I should advise first of all to visit British Honduras. I see know reason why British Honduras should be worse than Mexico as regards soil and climate. It is a British colony and labour can be got from India under a five years' agreement and for 50 cts. a day without food, cost landed £10, a head, but irrecoverable.

TEA AND COFFEE.

A Parliamentary Return showing "The imports of tea and coffee into the principal countries of Europe and into the United States, together with statistical tables relating thereto for recent years, as far as the particulars can be stated" was issued on the 28th November 1900.

In an introduction, Mr. A. E. Bateman, of the Board of Trade, says :—

"In another publication recently issued by the Board of Trade, returns relating to the production and consumption of alcoholic beverages were given, and, in the present Return, the chief non-alcoholic beverages are dealt with in the same way. The non-alcoholic beverages referred to are tea and coffee, for, with regard to cocoa, the statistics of its production and consumption are in many cases altogether wanting; besides which cocoa is not by any means such an important article of trade as either tea or coffee.

The statements given in the present Return have in all cases been compiled from statistics issued by the Governments of the different countries referred to. With regard to tea, in the case of India and Japan, the statistics, both of production and of export, are fairly complete, whilst as regards Ceylon and China the exports only can be given.

With regard to coffee, the returns are less complete, statistical science being almost unknown in those States of Central and South America where coffee is chiefly produced. It has been found necessary, therefore, to deal in these cases with the statistics of importation into the principal countries of Europe and the United States where coffee is chiefly consumed.

It will be seen how very largely both tea and coffee have been increasing of late years as articles of consumption—more particularly as regards tea in the United Kingdom, and as regards coffee in the United States of America.

For purposes of comparison, figures have been added relative to the consumption of tea and coffee in the years 1898 and 1899 in the British colonies of Australasia and the Dominion of Canada. From these it will be remarked that, though the consumption of coffee is small in these colonies, the consumption of tea in proportion to the population is very large, particularly in the case of Australasia.

I hope, in subsequent issues of this paper, to deal more at length with the consumption of tea and coffee in the principal British colonies."

The Return contains much useful information. The following table showing the consumption of tea per head in various countries is interesting:—

Years.	United Kingdom.	Russian Empire.	German Empire.	Holland.	France.	United States.	Australasia.	Dominion of Canada.
	Lbs.	Lbs.	Lbs.	Lbs	Lbs.	Lbs.	Lbs.	Lbs.
1897 ...	5·81	0·76	0·10	1·35	0·04	1·55	...	...
1898 ...	5·86	0·82	0·11	1·39	0·05	0·91	7·40	3·80
1899 ...	5·98	...	0·11	1·39	0·05	0·96	7·70*	4·72

* Partly estimated.

From the above it will be seen that in the United Kingdom nearly 6 lbs. of tea per head of the population are consumed. Sixteen years ago the *per capita* consumption amounted to, approximately, 5 lbs. There is no other European country where such a *per capita* consumption is approached. Indeed, there is no other European country, with the exception of Holland, where the consumption of tea exceeds 1 lb. per head. In Russia and in the United States also, which are the other two large tea consuming countries, the consumption amounts to under 1 lb. per head; in France the total quantity of tea consumed is under 2,000,000 lbs., or ·05 lbs. per head of the population; and in Germany it is 6,000,000 lbs., or ·11 of a lb. per head of the population.

The following interesting table is taken from the BOARD OF TRADE Statement above referred to:—

Comparative statement shewing the Consumption of Tea in the undermentioned Countries in each year from 1884 to 1899.

(*Quantities Imported for Home Consumption*).

Year.	United Kingdom	Russian Empire.	German Empire.
	Lbs.	Lbs.	Lbs.
1884 ...	175,091,000	74,412,000	3,432,000
1885 ...	182,443,000	62,424,000	3,654,000
1886 ...	178,910,000	74,736,000	3,562,000
1887 ...	183,639,000	72,756,000	3,872,000
1888 ...	185,470,000	69,156,000	3,912,000
1889 ...	185,628,000	68,904,000	4,125,000
1890 ...	194,009,000	69,012,000	4,389,000
1891 ...	202,456,000	70,740,000	4,886,000
1892 ...	207,121,000	77,112,000	5,454,000
1893 ...	208,098,000	79,272,000	5,887,008
1894 ...	214,341,000	88,740,000	6,248,000
1895 ...	221,800,000	92,484,000	5,597,000
1896 ...	227,785,000	94,032,000	5,436,000
1897 ...	231,400,000	98,316,000	5,614,000
1898 ...	235,414,000	107,820,000	5,922,000
1899 ...	242,561,000	104,112,000*	6,039,000

Year.	Holland.	France.	United States (year ended 30th June.)
	Lbs.	Lbs.	Lbs.
1884 ...	3,894,000	1,168,000	60,062,000
1885 ...	4,770,000	1,056,000	66,374,000
1886 ...	5,095,000	1,217,000	78,873,000
1887 ...	5,388,000	1,225,000	87,481,000

1889 ...	5,203,000	1,190,000	79,192,000
1890 ...	5,599,000	1,351,000	83,495,000
1891 ...	5,889,000	1,346,000	82,396,000
1892 ...	5,859,000	1,448,000	89,611,000
1893 ...	6,120,000	1,503,000	88,131,000
1894 ...	6,580,000	1,542,000	91,802,000
1895 ...	6,437,000	1,604,000	96,437,000
1896 ...	6,589,000	1,685,000	93,340,000
1897 ...	6,747,000	1,705,000	112,908,000
1898 ...	7,071,000	1,837,000	67,697,000*
1899 ...	7,102,000	1,947,000	72,835,000

* Provisional figures.

* Duty imposed on Import from 13th June, 1898.

TEA.

In connection with the Nyasaland Agri-Horticul Association there was lately an essay competition, and winner was Mr. Henry Brown, of Mlanje. We reprin essay from the *Central African Times*:—

There are several products well suited for cultivation in B. C other than coffee, such as sugar, tobacco, arrowroot, ginger, turn cotton, chillies, etc. These I dispose of (although they may very well) because the land requires to be prepared for them e time a new crop is required, and they are not permanent prod *Cinchona* being a drug the market can be flooded any day the price reduced to a non-paying level.

Rubber.—It is long before the tree yields enough to pay a cheap substitute is likely to be found which will reduce the p

Vanilla and Pepper.—Although permanent occupiers of the the consumption is limited and they for various reasons are h suited to native gardens or small cultivators.

For the reasons given above I select tea as the most sui product other than coffee for the consideration of planters as in my opinion the best suited for European cultivation, bei permanent occupier of the land; consumption is likely to keep with the production and the price cannot go below that which yield a profit to the cultivator otherwise the production mu reduced; when the natural consequence of higher prices w ensue as it is consumed by the masses.

The general opinion of planters whom I have met in B. C. that tea requires a heavier rainfall than we have here. To d this idea however I would point out that tea has a wider rang cultivation and can be grown under more varied condition climate than any other product. Further, tea is grown as north as the Caucasus in Russia and in Natal, our near neigh in the South, and in both countries the cultivation of the plan passed the experimental stage.

Natal where tea has been successfully grown has a similar fall to the drier parts of Nyasaland, *viz.*, from 40 to 48 inches annum. In winter the temperature is at 6 a.m. from 50 t degrees fahr. and at 11 a.m. rises to 80 and 84 degrees. In sum at sunrise 44 degrees to 70 degrees are registered and at 11 a.m to 96 degrees, which is very similar to our own climate. Son the Indian districts where tea pays well have a very limited rai and badly distributed as there are four to five months during w no rainfalls at all. From official reports in the following districts the average for five years is as follows:—Dhubri, 7 Ganhabong 59.26 inches and Nowgong, 77.68.

The elevation at which tea can be grown is from sea level to and 6000 feet. At extreme elevations a comparatively dry cli is an advantage.

A period of rest for tea such as some of the Indian distr Natal, and Nyasaland have during the cold season (three to months,) when pruning can be done, is considered beneficial.

Experience of tropical agriculture in other countries as wel here should lead one to the conviction that B. C. A., judging f its soil and climate, is more suited to be a tea than a coffee pr cing country chiefly because there is a very limited area fit coffee growing. Coffee requires either primeval forest or very virgin soil to prove a paying investment. with even greater ad tages in cheap land and labour than we possess.

Coffee when planted on land that has been in cultivation wi 50 years or upon burnt grass land must be manured after the crop to keep up anything like a remunerative yield. This is the case with tea for it has been giving paying crops of leaf reclaimed abandoned and worn-out coffee estates and upon "chea and scrub land for many years past in Ceylon and India. unlike coffee and other products which might be grown in B. C is not therefore dependent upon surface soil to maintain fertility, neither does it require virgin land to ensure paying flus of leaf as the plant is a deep feeder and depends mostly on nour ment obtained from the sub-soil. It would be well to remem however that the soil cannot be too rich and the deeper and m pliable the land is the better the tea flourishes on it. Good d subsoil seems to be of more importance to the tea bush than surface soil and this fact is borne out by the success of tea on worn and washed, steep coffee estates in Ceylon, which have b in coffee 20 to 30 years and are at present yielding 500 to 700

f made tea per acre, and paying their owners as much as 20% nterest on their investment. Any soil in B. C. A. that would roduce leaf may be reckoned good enough for tea Tea does not uffer much from weeds and bad cultivation. I have known tea learings abandoned for a year or more and when cleaned up the ea seemed to have grown apace with the scrub and had only to be ut down and the flushes plucked as if nothing had happened to etard its growth. Indeed I see nothing to hinder Nyasaland from aking a place amongst the tea producing countries of the world.

There is another recommendation for tea cultivation, *viz.*, that it loes not depend much upon climate, and if a flush of leaf is lost rom want of labour or from any other cause, the cultivator has nly to wait for another flush which is sure to come in another ortnight or so. For at least eight months in the year leaf can be plucked. On the other hand with coffee unseasonable rain or drought may destroy the prospects of the planter for a whole year.

Tea, as far as I have observed, during the last eight years or more, has no enemies here likely to prevent the plant from giving paying crops.

There are no difficulties in connection with the curing of tea that cannot be overcome here the same as in other countries where the bush is grown.

Expensive machinery is not required until an estate produces tea enough to pay for it. On small gardens tea is rolled by hand on ordinary tables, and is fired over "choolas" with charcoal fires, or a flue drier. With the latter 20ft. long to take three rows of trays, as much as a thousand pounds of made tea per diem can be turned out. Hand rollers and driers can now be bought about as cheap as hand coffee pulpers. A market might be got in South Africa for all tea that Nyasaland can produce for many years to come.

Cost of production and profits.—I need not enter into details on this question but suffice it to say that B C. A. owing to the cheap labour available can produce a cheaper tea per pound than any other country, and can therefore compete favourably with other parts of the globe. Transport is no dearer when compared with the outlying districts of China, India and Ceylon.

Varieties.—Indigenous Assam and China are the only two distinct varieties. The chief characteristics of the former are that it has a single upright stem, large serrated leaves is delicate to rear, and does not stand extremes of cold or heat without a serious check in its growth.

The latter is a very hardy bush or a dwarfy character, small leaved, a slow grower, with stems springing up from the lateral roots. It stands great vicissitudes of climate and is able to withstand frost and snow in China.

It is more suited for a cold than a hot climate and flushes better in the former, but seeds too freely and to the detriment of its yield of leaf.

The hybrid is a plant obtained by cross fertilization between the Assam tree and China bush. This is considered the best and most profitable plant to cultivate at medium elevations and even at low and high altitudes In other countries it is preferred to the pure varieties. The hybrid shows every shade of gradiation between the parent trees. There is a very good hybrid in the country which flushes well.

This essay does not admit of my going into details of routine, cultivation, and curing of tea, which is more the subject for a tea planter's manual, but a few brief sentences may not be out of place.

Land for tea planting is cleared in the same way as for coffee, and the methods adopted are familiar to most planters.

Nurseries.—Select a damp spot, but not with sour soil; prepare the beds and sow the seed the same as coffee. Shade is not required but water freely in dry weather. Plants are fit to be put out in from six to nine months.

Lining.—The best distance for hybrid tea and that generally adopted is three by four feet, but in some countries four by five and even five by six feet is not uncommon. The hedge system of planting is favoured by some, and on steep land it is good for saving wash.

Holing.—It is not considered necessary to cut large pits for tea the same as for coffee. Pits should be of a greater depth than width, 12 by 15 inches is a common size and dibbling with a crowbar or stick is often, resorted to.

Planting.— The less the roots are disturbed in lifting tea plants from a nursery and the more carefully they are planted the better results will be obtained. Disturbing the roots and exposure to the atmosphere gives a greater check to tea than coffee plants. Planting at stake cannot be recommended in this country although in low, hot situations where the rainfall is great and wet weather can be depended upon for several months it does very well.

Plucking.—After about 18 months flushes of leaf can be taken and the yield of tea increases till the bush attains an age of six or seven years when it is considered in full bearing. Only two leaves and a bit of the third should be plucked to make a good quality of tea and the flush should be gathered before it gets too old. When allowed to run too long the leaves are hard and they make the tea in the cup bitter to the taste.

Withering.—The leaf should be spread thinly on mats in a shed and rolled when it sticks together in a lump when squeezed in the hand. Over withering, drying, or heating the leaf is bad.

Rolling.—This is performed on a table or in a rolling machine till the sap cells are well broken up and the juice exudes freely from the leaf.

Fermenting.—The tea is spread out about four inches thick or pressed into balls and allowed to attain a light or dark copper colour before breaking up for firing.

Firing.—This is done over a charcoal fire upon trays; with hot air in a drying machine; or by means of a flue till the moisture is all expelled.

Bulking and blending.—As the different making of tea differ in flavour, etc., the custom is to put each day's out-turn into a large air-tight box or bin and when full refire the whole, then turn it over with shovels on a clean floor till thoroughly mixed after which it can be sifted into the different grades and packed for market.

APPENDIX.

I omitted to mention cocoa in its place before cinchona. From what I know of cocoa cultivation, and judging from the appearance of the solitary plant as far as I know in existence in B. C. A. at Lauderdale estate, Mlanje, this tree is not to succeed well in Nyasaland. The plant at Lauderdale is now about five years old about four feet high, with a diameter of about three feet. A cocoa tree in its proper climate should be from six to eight feet in height with a spread of branches about five or six feet and in partial bearing at five years of age. For cocoa Nyasaland has too great extremes of cold and heat to thrive well. During the winter months the tree looks wretched and suffers much from cold and during the dry season from September to December the air appears too dry for the tree to flower freely or set any fruit.

THE MARKING OF TEA CHESTS.

Captain N. Harrison, Commander of the ss. *Clan Macdonald*, writes as follows :—

Having been in the Clan Line almost from the starting of that Company, I am rather a large tea carrier from this port: consequently I feel myself in a position to advise tea shippers, both in the interests of themselves and the ships, to have the tea chests marked TOP. This mark to be put on the proper side (that side which bears all round without tenons.) I feel pretty certain that the damage to chests and consequent loss of tea, etc., would be reduced at least 50 per cent. by this mode.

COLOMBO TEA SALES.

ANOTHER YEAR OF EXPANSION.

Below we give the figures of the weekly sales of tea in Colombo for 1900—from January 10th to December 19th. The number of weekly sales were fewer than usual. Besides an additional week's vacation at the New Year, and a week's holiday at Easter, an innovation was instituted on the 26th September in the shape of a tea tasters' holiday. This had little, if any, effect on the total offered and sold; and we have a new record to announce in not only an advance, but a greater advance than ever before. Who, in 1890 when 5,961,902 lbs. were sold in the auction room—would have ventured to prophesy that in 1900, 36,254,900 lbs. would be so disposed of. A year ago it required little pre-science to anticipate the greatly increased patronage of the local market which this year has witnessed. When in December last we were giving a similar table as to-day we remarked:—"We trust to see in 1900 a third of the

total output offered locally." This has been realised, notwithstanding that the estimate of export this year was recently raised to 142,000,000 lbs. Thus 47,333,333 lbs. were needed to constitute a third, and the actual figure is 47,669,583. The totals offered for the past three years are as follow:—

	Offered.
1898	36,175,644
1899	38,655,059
1900	47,669,583

We congratulate both producers and Colombo dealers on this development. The prices obtained in 1900 compare unfavourably with those of 1899, but that year stands out as displaying a temporary check to the uniform descent of previous years. The weekly averages this year compare closely, and on the whole favourably, with those of 1898—until the end of October, when the slump began which culminated this month in the lowest figures on record—two weeks with 29 cts. average, followed by two with 28 cts. The figures for each week and the year's totals are appended:—

A LIBEL ON CEYLON AND INDIAN TEAS.

The Ceylon Chamber of Commerce addressed the Ber Chamber of Commerce as follows on the 12th ultimo:—

DEAR SIR,—I am directed by my Committee to draw the atten of your Chamber to the enclosed Circular, to which a tranlatio attached.

This Circular was originally forwarded to our Ceylon Com sioner in Europe, Mr J. H. Renton, from Switzerland, with earnest appeal to have the statement publicly and authoritati contradicted. Its effect, we are assured, all over the Contin but especially in Holland (where you are aware Anglophob just now rampant), has been most damaging to the interest Indian and Ceylon planters. Mr. Renton referred the matte the Ceylon Association in London, and through the efforts of Secretary and other gentlemen the following facts have been elici

The editor of the *Globe* admits that the paragraph appeare his journal, and states that it was copied from the Calcutta *Eng man*. Further attemps to trace the origin of the article have fai probably owing to the anxiety of the London organ to suppres share in this gross and damaging libel.

My Committee has been urged by the London Association take the matter up officially, and they feel that the first step i request your Chamber to vigorously co-operate with them in trac the origin of the obnoxious article.

The allusion to "maunds," certainly seems to point to an Ind source, for we do not use the term here.

Requesting the favour of your early attention, and promis the ready support of my Committee to any scheme which m suggest itself to your Chamber for dealing with the matter.—I dear Sir, yours faithfully,

F. W. WALDOCK,
Secretary.

BULLETIN COMMERCIAL.

DE LA MAISON VD. J. VAN DER CHIJS AND ZOON'S.

Delft (Hollande), Nov., 190

(*Translation.*)

The Jingo paper, the *Globe*, has just published an instructive articl the manner in which Ceylon and Indian teas are manipulated.

It appears that numbers of the English planters mix the sweeping the tea factories with their produce. Chemical analysis of several sam has proved that these contain less than 50% of tea, the balance consist sand or other waste. Buyers have thus been cheated of half their mo it is in Ceylon that this fraud most frequently takes place. These swe ings sell five rupees the maund (80 lbs. English). One is astonished t the English planters lend themselves to such an improper practice to ob so small a benefit But many of them who cultivate the Indian and Cey teas are obliged to have recourse to such improper methods in order t able to pay dividends to their creditors.

RETURNED.

It would appear, observes the *London Commercial Record*, t East India no longer lays claim to being an exporter of its prod pure and simple, for recent events have shown that under gi circumstances it is an importer of some consideration of its o produce as well. The rumour of a shipment of about 100 tons Cochin ginger to Bombay, of which we made mention a little wh ago, does not seem to be without some foundation; on the contra there are some people in the Spice trade who profess to be "in know," who positively affirm that such a quantity has been ship to that Indian port, although we must confess we have, so far, b unable to trace the exportation in the official Custom's List. O a few hundred packages are reported officially as having been warded to Bombay from London, and that being the case, we naturally sceptical as to the veracity of the rumour. It appears us more like the wish being the father of the thought, and yet fact that Bombay dealers have actually been bidders in our mar this week lends undoubtedly some colour to the rumour. We h Bombay has wired some orders for fair quantities of Cochin wash rough in the neighbourhood of 28s. c.i f. Bombay, without meet with sellers, the market having become firmer as far as rou descriptions are concerned, and nothing under 30s. f o b. is obta able. As the market in the East is extremely firm, there is ev possibility of the bid being repeated at a higher figure, a business in the end may result which would be very satisfact

ith regard to our stocks. But it is not ginger alone which ndia stands in need of; Cardamoms, principally seeds, have f late been in strong request as well. So great, indeed, has een the demand for export to India recently that our market has ractically been cleared of seeds. Considering the deplorable state which India has been for some years, it is not to be wondered at hat stocks of certain commodities have been allowed to run unduly ow. Now that the plague is practically stamped out, that the ffects of the famine are quickly disappearing, and the gloom cast ver the country is vanishing, dealers and consumers find themelves face to face with an absence of stocks of those articles which hey had become accustomed to look upon as their favourite comnodities for dealing and speculating, and, as prospects of the rowing crop of both ginger and cardamoms are far from satisactory, they lose no time in securing some lots in London, where tocks are still heavy and prices low. This is what we have been vaiting for, and London is, therefore, not slow in appreciating the eal position, as was clearly proved by the result of this week's ginger and cardamom sales. Both passed off with spirited competition—fine sorts of cardamoms paticularly enjoying good support —and resulted in an advance of values. The position of both articles s unique, and the prospects at the moment are for an improvement n both articles.

NOTES ON COMESTIBLES.

CHICORY

is the white, milky root of a plant known as the wild endive. It is cultivated in Holland, Belgium, France, Germany and England. The roots are large, fleshy and carrot-shaped. When dug up in August or September, the roots are washed out into small pieces and dried until about a quarter of their original weight. They are then roasted with a little oil to prevent burning and ground into powder, when they are ready for mixing with coffee.

CHOCOLATE

was first introduced to Europe by Humboldt, who found it in common use as a beverage by the Aztecs of Mexico when he conquered that country. It is now one of the popular beverages of Europe, and as a flavoring it ranks second to vanilla. It is prepared from the roasted seeds of the cocoa tree mixed with sugar, sago, potato-flour, corn-flour or some similar farina.

CINNAMON

is a native of the East Indies, China and Japan. The cinnamon of commerce is the bark of the cinnamon tree, which is one of the wonders of nature. Beside the valuable properties contained in the bark, there are the buds, known as cassia buds, which are so rich in flavor. An oil, similar to clove-oil, is made from the leaves. Camphor is derived from the roots and the fruit yields an oil, called cinnamon suet, which is highly fragrant, and in Ceylon was formerly made into candles for the exclusive use of the king.

CLOVES

are the dried, unopened flowers of the clove tree, which is now cultivated in several tropical countries. About four-fifths of the world's supply comes from East Africa, the city of Zanzibar being the great centre of the trade. The principal method of adulterating cloves is to include an excess of stems, sticks or stalks, which contain very little virtue.

COCOA, THE BEVERAGE,

is made from the berries or seeds of the cocoa, a tropical evergreen tree. The berries are harvested twice a year, in May and October. When gathered, they are conveyed to the "sweating-house," where they are submitted to a process of fermentation for from 4 to 10 days. This improves their taste, and gives them a fine, rich appearance. The process is completed when the pod falls off the bean, which is the cocoa of commerce. They are then dried in the sun, and shipped in bags of about 100 lb. each. These kernels or beans are, in this state, capable of yielding genuine cocoa. But, as this product is rather too rich, and is hard to cook, it is principally sold in the manufactured state. The variety in quality and price is largely due to the proportion of cocoa beans used as compared with the amount of inferior materials. As it lends itself easily to adulteration, the retailer should be careful to avoid new brands, when the special advantage claimed for them is their low price.

GINGER

is obtained from the knotty, fibrous roots of a reed-like plant, cultivated in several tropical countries, especially in Jamaica. Preserved ginger is made from roots taken from the ground early in January when they are five or six inches long and quite succulent. The dry gingers are dug up a few weeks later when the roots are firm and fibrous. The black whole ginger is made from the older, inferior roots by scalding them in water and drying in the sun. The best and soundest roots are made into whole white ginger by scraping off the outer dark-colored part and then drying without scalding. The finest whole ginger is new, dry, plump, heavy, white in color and chalky or crumbly in texture, but without worm holes.

MUSTARD.

The use of mustard, powdered in its present form, originated in Durham, Eng., about the year 1720, where it was prepared on a small scale by an old lady named Mrs. Clements, who kept the secret of its manufacture to herself—grinding the seed in a mill and sifting it—for several years. She visited London and the principal towns in England twice a year, thus founding the reputation of "Durham Mustard." Mustard is made from a mixture of different kinds of mustard seed, white, black or brown in color, and with or without * the addition of other ingredients, such as wheat flour, turmeric, cayenne, etc. It could be made from white seed alone, but, as the brown and black seeds only possess the oil yielding the piquant flavor which is so much esteemed, a mixture is necessary to produce the finest goods.

NUTMEGS AND MACE.

The nutmeg is the kernel of the fruit of the nutmeg tree. (Mace is the covering around this kernel.) The tree, which resembles in shape and size the pear tree, yields about 10 lb. of nutmegs and 1 lb. of mace each year under ordinary circumstances, but it is said it will produce 10 times that amount when highly manured. Nutmegs are liable to attacks of insects. These can be got rid of by exposing them on seives to the fumes of burning sulphur in a close vessel. The substitutes which have been most often sold as nutmegs are made of wood or of a paste made of flour, oil and nutmeg powder. Most of the nutmegs used in Canada come from the West Indies.

PEPPER

is a general term used for various hot, pungent and aromatic pods, berries, fruits or seeds obtained from the "Piper" species of plant. In the Middle Ages all imported aromatic spices were designated pepper. The natural family of the plant is now known to be limited to four plants only, of which the black pepper, the long pepper and cayenne pepper are the only kinds in general domestic use. From the black pepper berry or seed white pepper is produced, by taking off the husk before grinding. Black pepper is more pungent than white, on account of the acid resin, known as piperine, and a volatile oil contained in the skin or fleshy part. Ground white pepper is frequently adulterated with linseed meal, flour mustard husks, ground olive stones, ground rice, ground long pepper, and even by sand and clay.—*The Canadian Grocer.*

TEA AT THE LONDON DOCKS.

REQUIRES FOUR TIMES THE SPACE FOR OTHER GOODS.

"One Who Knows" writes to *Fairplay* :—

In Mr. Rogers's evidence before the Royal Commission he is reported to have said that the rates for tea were enormous, and he implied that they were so in consequence of a combination called "The Tea Clearing House," and that they were double as heavy as the rates for coffee. Now coffee rates include collecting from import vessel, lighterage landing, sorting to quality, weighing, piling away, and delivery to numbers; but the cost of this working is very considerably less than that of working tea. Tea has to be collected from lighter from import vessel, landed to marks, species, and numbers, laid down, each chest opened for inspection, packages repaired, weighed in presence of H.M. Customs Officers, put on show, samples served to the trade, warrants, weight-notes, and landing accounts of each individual chest, and delivery to picked numbers.

* We know of no commercial mustard free from admixture, nor do we think that *pure* mustard would be saleable. Its strength would be objectionable.—Ed., *P. O.*

The following extract from the printed and published list of charges on tea will show exactly the nature of the work that has to be done:—

The operations necessary under the management and bulking rates are:— Management Rate includes receiving bills of lading, getting same released, Customs entries, having lighters, or vans, in attendance upon steamer's arrival, conveying tea to warehouse by road or water, landing, sorting to marks and species, coopering where required, and weighing gross with H.M. Customs' Officers, marking and scribing number, rotation, year, and weight on each chest, opening and laying each break for broker's inspection, re-coopering, drawing, and forwarding samples, piling away in warehouse to picked numbers, weighing and delivery, placing chests on show for public sale, attendance while on show, and serving the trade with samples, adjusting to original weight, and nailing up, furnishing landing accounts and warrants.

These operations take at least four times the room that the same weight of coffee, sugar and similar goods would occupy, an important consideration where rent, rates, and taxes are based on superficial measurement of floors, and the rental earned is consequently less than a quarter of that earned on the other goods mentioned. I think that Mr. Rogers will have great difficulty in finding amongst his forty witnesses anyone to controvert the truth of this statement.

THE PLANTER AND THE SELANGOR GOVERNMENT.

(With Apologies to *Truth*.)

Planter.—Concerning the road you engaged to construct
As a means of exploiting the State,
It is more than three years since you started the job
And it scarcely is yet up to date.
I thought I would call just the cause to enquire
Of this very amazing delay
Oh, when will you finish it—really, dear Sir?

Government.—"We are carefully feeling our way."

Planter.—There is also the tap-drain that should have been cut
For I heard that the contract was let
To a *really good man;* may I humbly enquire
If he's started to work on it yet?
Is it really the fact as I hear from my friends
That the cause of this woeful delay
Is—the middle is done, but alas! not the ends?

Government.—"We are carefully feeling our way."

Planter.—And when you have felt it to judge from the time,
For this small piece of work I'd to wait,
I shall probably find you've constructed a drain,
That's a perfect disgrace to the State.
The planters would flock in from near and from far,
It's possible now that they MAY,
But with premium on land at a dollar, Oh, no!

Government.—"We are carefully feeling our way."

Planter.—There are some applications for land, I believe
That were made just a twelvemonth ago,
No grants for the same have been issued, I think,
Though, of course, I am not in the know.
May I ask when you think a surveyor will come?
His fees I am willing to pay,
Though the road is impossible, still there's a launch.

Government.—"We are carefully feeling our way."

Planter.—The labour is scarce, and the sickness is great,
But 'twas something like drawing a fang
When they told me that all of the votes for the year
Were transferred from this district to Klang!
You'd best have a care how my patience you try or incensed
by your needless delay
I shall find out a way to my feelings express
While you're "carefully feeling your way."

RUSTICUS in the *Straits Times*.

RIVAL FERTILISERS.

NITRATE OF SODA AND SULPHATE OF AMMONIA.

The rival claims of nitrate of soda and sulphate of ammoni fertilising substances for agricultural land have for a numbe years been the subject of much spirited debate. There are m experienced farmers who pronounce unreservedly for sulpha ammonia as the best nitrogenous accompaniment to min manures, while the majority perhaps hold as firmly to nitra soda as the more effectual dressing. This sharp conflict of opi is not surprising in a sense, for the acute dissension that exist almost every point connected with the wide subject of manurin one of the most remarkable features of modern farming. A cl examination of the testimony arrayed on either side of this l standing debate, however, reveals traces of argument somew removed from the region of practical and unbiased evidence. peculiar circumstance connected with the use of the rival nitr nous manures is that the respective sides rigidly adhere to substance of their fancy, whatever may be the character of the or of the soil. Unprejudiced discrimination seems to be spicuously absent, for the two materials seem to be seldom fo on the one holding. A searching investigation of the rela merits of the two manures does not confirm the wisdom of exclusive use of either of the invaluable materials. The substa are really less antagonistic than is usually supposed. They similar in their chemical contents, but essentially different in t fertilising effects, and consequently the one substance is o incapable of economic substitution by the other, as is intellige shown by Professor Warrington in the paper that appears his name in the Royal Agricultural Society's journal. Nitrat soda is, of course, the more speedy in its action, and is thus p liarly adapted for application as a top-dressing when the establis plants appear to need encouragement. It is also more effectua dry seasons than sulphate of ammonia. The latter, however, highly advantageous manure for spring application, along v phosphatic and potassic materials, and while nitrate of soda usu gives the better yield as measured by bulk, sulphate of ammoni the more efficacious in improving the quality of the crop. selection of the nitrogenous dressing is distinctly a matter careful and intelligent discrimination, and not, as is often suppo one on which the fancy of the individual may be humoured v impunity.—*The Field*.

DISTRICT ASSOCIATIONS.

INDIAN TEA ASSOCIATION.

Extract from Abstract of the Proceedings of a Meeting the General Committee held at Calcutta, 18th December, 19 Mr. W. Brown, Vice-Chairman, presiding.

Letters of 23rd and 30th November, from the Secretary, Ind Tea Association, London, were brought up for final considerat and disposal. The chief matters dealt with in these letters were

(*a*) **Work on the Continent.**—In his letter dated 23rd Novem Mr. Tye reported that the London Committee had arranged subsidise the "English Tea Rooms," 23 Pizza di Spagna, Ro to the extent of £75 per annum for three years; and in additio give a bonus of 10s. per chest for each chest of Indian or blen British-grown tea, sold during the year in Italy, up to a maxim of 50 chests in the first instance. The subsidy was to be spent the proprietress of the Rooms—in consultation with Mr. J. E. Harrington— in pushing the sale of Indian tea in Italy, both judicious advertising and by the opening of branch agencies in principal Italian towns. Reports and accounts were to be rende to the Association quarterly.

(*b*) **Publication of Details of Sales in London.**—In the same le it was stated that the London Tea Brokers' Association had brou forward a proposal for restricting the publication of the pr given, and bids made, at the sales of tea. It was considered by brokers and the dealers that this publicity was adverse to t interests as well as to those of producers. They, therefore, posed the issue of catalogues to the recognised body of Lon dealers only. The Ceylon Association had passed a resolu in favour of the proposal, being tried for six months. The Lon Committee had it under consideration.

(c) **Enhancement of British Import Duty.**—It was stated in the etter, dated 30th November, that the proposed memorial to the Chancellor of the Exchequer (mentioned in the proceedings of the neeting held on 4th December) upon this matter had been prepared. It was to be presented to Sir Michæl Hicks Beach in December by Sir Henry Seymour King, M.P. Copies would be ent to Calcutta in due course.

Considered letter, dated 11th November, from the Secretary, United Planters' Association of Southern India, forwarding a copy of the following resolution which was adopted at the Annual Meeting of that Association held on the 8th August last, *viz.* :—

"That considering the critical condition of the tea and coffee industries, this Association do communicate with the Indian Tea Association the Ceylon Planters' Association, the Indian Chambers of Commerce, and the leading firms of merchants and brokers interested in tea and coffee, etc., in this country and in England and her Colonies with a view to ascertaining whether a movement in favour of a commercial combination of Great Britain and her Colonies and India against the world (which would by a system of differential duties afford some protection to British-grown products and manufactures) would receive support.

In the letter it was also stated that there was felt to be a strong, and growing, feeling in England, and her Dependencies and Colonies in favour of what might be termed an Imperial Fiscal Federation for the protection of British interests as against those of the rest of the world. The Planters' Association was desirous of eliciting opinions on the subject, with a view to the submission of memorials, etc., to the Home Government and the other Governments concerned.

After consideration the General Committee decided to submit copies of the letter to all the members of the Association, and to the different branches for expressions of opinion. The nature of any action, which it might be considered desirable to take in the matter, could then be determined.

The attention of the Calcutta Tea Traders' Association was to be drawn to the question of revising the present method of drawing samples at the Tea Warehouse.

A note by Mr. H. H. Mann on "a suggested remedy for Thread Blight" was to be published for the information of the members of the Association.

SHE CARRIES IT WITH HER.

When Mrs. Mary Wren is about to start on a trip to Sydney she always packs in her bag a bottle of Mother Seigel's Syrup. Of course, she is careful to put it where it is not likely to get broken, as she does not want to waste the medicine, neither does she want to spoil her things. So far, I am glad to say, she has carried the precious bottle without an accident.

And when she gets home to Acacia Cottage, Bridge Street, Muswellbrook, New South Wales, she has always reason to be thankful that she took the Syrup with her.

For, you must know, that on the 20th day of Sept., 1899, Mrs. Wren was 75 years old, and fifty of them she has spent in the town of Muswellbrook. She has had fifteen children, ten of whom are still living; certainly a record of which she has a right to be proud.

Now, to make this little tale run straight; and to keep the kinks out of it, we shall have to hark back to the place where it properly starts. Better still, perhaps, to let the good old lady tell it herself, as she does in a letter dated 21st of September (next day after her birthday), 1899.

"Most of my life," so she goes on, "I had suffered from indigestion and wind on the stomach. I have often been up half the night trying to relieve the terrible pains caused by the wind.

"I spent a lot of money on the essence of ginger and other things, but they all failed miserable. The essence of ginger would warm me for a few minutes, and then the pains would be on again; just as a barking dog begins again after you have hit him with something. That's the way it was with me.

"About five years ago I had a very bad time with influenza; and when I was slowly getting over that the indigestion came on worse than ever. We couldn't do anything for it, or with it; no more could the doctors.

"Then an old friend happened in, and she said, 'Why don't you take Mother Seigel's Syrup?' I told her I didn't believe in any of the advertised medicines. She went on imploring and entreating, and I said she might as well save her breath, for she couldn't move me an inch out of my own opinions.

What does that woman do but go and buy a bottle without my knowledge, and fetch it to me? Then I gave in and began trying it. That very bottle helped, and, after taking a few bottles more, I was as well as anybody wants to be.

"Since using Mother Seigel's Syrup I have got rid of all my pains and aches, and to make sure of keeping them away I carry a bottle with me wherever I go."—Mary Wren.

Mr. William John Davison, Saddle and Harness Maker, of Muswellbrook, writes that he has known Mrs. Wren for 30 years, and the public may put full faith in every word she says.

THE ART OF SINGING.

BY SIMS REEVES.

"Remedies for the Throat."

"All kinds of lozenges for the voice are to be avoided; some do harm, others have no effect, and none do good. Sugar and water, or a little glycerine, gives relief when the throat is inclined to be dry; this applies to persons whose throats are affected by the weather. About a third of a teaspoonful of Condy's Fluid in a tumbler of water, if used as a gargle every morning, will clear the throat and brace up the uvula, which, in some singers, is so long that it interrupts the pure emission of the voice, and introduces a grating undertone, while it also tends to make a tremolo on the upper notes."—*The Idler*, February, 1900.

MARKET REPORT.

[*Per Mail advices of 7th December* 1900.]

COFFEE.

The London Commercial Record says:—There is nothing of interest to record in this market. Supplies at auction have been both small and unattractive, and the trade seem quiet indisposed to business. In the market for "futures" there have been a few fluctuations; early in the week reported damage to the next crop by rain caused a rise of 1s per cwt., but on large receipts the tone became depressed and the advance was lost. Yesterday March delivery Santos sold at 34s 3d to 34s 6d, May at 34s 9d to 35s, September at 35s 6d to 35s 9d, and December at 36s 3d. Catalogues to-day comprised:—195 bags East India, 57 bags 63 barrels Jamaica, 706 bags Nyasaland, 511 bags Guatemala, 243 bags Salvador, 440 bags Colombian, 242 bags Mexican, 193 bags Nicaragua, 385 bags New Granada, and 1,440 bags unwashed Dumont. The sales went off quietly. Colombians were 1s per cwt. lower. Other descriptions unchanged. We quote:—

London ...	Santos ...	March delivery ...	34s 4½d.
New York ...	No. 7 Rio...	,, ...	6·30 cents.
Hamburg...	Santos ..	,, .	35¼ pf.
Havre ...	Santos ...	,, ...	42 francs.
Holland ...	Good ordinary Java ...		35 cents.

Imports, Deliveries and Stock of Coffee in London, are as follows:—

December 6 ..	6·05	6·10	6·20	6·30	6·35

TEA.

CHINA.—The market is quiet, but about steady. At auction during the week 4,672 packages offered and partly sold as follows: Kaisow 3⅛d, Panyong 5d to 5½d, Soomoo, 4¾d Souchong 4½d, to 4¾d, Moning 5d, Formosa Oolong 6½d to 9d, Flowery Pekoe 8½d to 9d, Scented Orange Pekoe 5¾d. Moyune Green:—Gunpowder 8½d to 1s 2d, Imperial 4¼d to 7½d, Sow Mee 6½d to 1s 5½d, Foong Mee 9½d to 11¼d, Hyson 3½d to 4⅜d, Young Hyson 4d to 8d per lb.

INDIAN.—Auctions comprised 44,600 packages against 46,900 packages in the week before, and 38,600 packages at the same time a year ago.

A somewhat better tone was observable owing to more general enquiry, resulting from a feeling that prices are not likely to recede further. There was no material change in quotations for common and ordinary grades which continue to bring about the same, but in some cases over 7d per lb the bidding was brisker, especially for strong useful Broken Pekoes Fine and choice lots were not over plentiful and sold well.

For 38,500 packages on Estate account 6¾d was obtained, contrasted with 8d per lb. for 34,500 packages, 7⅞d per lb. for 36,300 packages in the two preceding seasons.

November deliveries were more satisfactory than of late amounting to 13,785,000 lbs or fully equal to those of 1899, and it is now to be hoped that dealers having used up their old duty-paid stock the clearances may again assume a normal state. For the eleven months from 1st January, 132,359,000 lbs. were taken from the London Bonded Warehouses *versus* 129,170,000 lbs. for the corresponding period previously, so that the statistical position should soon look more favourable.

CEYLON.—Rather more was brought forward in Public Sale, *viz.*, 22,500 packages opposed to 19,200 packages on the foregoing Tuesday. During the similar interval in 1899 offerings were 23,100 packages.

Competition was scarcely so strong for common to fair Pekoes and Pekoe Souchongs, while broken kinds under 7d per lb. were in less request, and a decline of ¼d to ½d per lb. was often noticeable. Continental houses were again puchasers of medium to fine leafy descriptions which were also wanted by the Home trade, and consequently ruled firm to dearer in most instances Unevenness was again apparent in Broken Pekoes and Broken Orange Pekoes, but on the whole they did not shew much alteration.

The average is 7⅝d per lb. On the 29th ultimo it was slig over 7½d per lb., and 7¾d per lb. in 1899 Consumption seems t benefiting by the low range of prices current, deliveries for past eleven months being 97,999,000 lbs., and 87,082,000 lbs. in former year.

JAVA.—A little over 800 packages of direct import passed hammer. The upper lines were taken up freely at enhanced ra but others went slowly. For the 13th instant 540 packages advertised.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon and Ja Tea Report, dated December 7th, 1900, *says :—*

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DA

	Indian. Pkgs.	Ceylon. Pkgs.	J P
1900-1901	805,605	664,894	27
1899-1900	877,596	650,367	31

47,541 *pkgs.* INDIAN
23,146 ,, CEYLON
844 ,, JAVA
} Total 71,531 packages were offered in public auc this week.

Movements of Tea during November show that the recent range of price has counteracted to a very large extent the eff of the increased duty, and for the first time since March last monthly delivery of Indian and Ceylon Tea shows an expans over the corresponding period last year. This expansion is sa factory, but it has been dearly paid for by the producers of Te our own Dependencies, the average price obtained for Indian Ceylon Tea during November being more than 1d. per lb. be the price ruling during November, 1899. In the case of the lo grade Teas on which the increased tax is most heavily felt, decline has amounted to nearly 2d .per lb. The deliveries of C Tea on the other hand show a falling off, and thus the total sumption of all descriptions of Tea mark but a very small incr over November last year.

INDIAN.—Trade has continued fairly brisk and there has sufficient demand to maintain prices for the quantity of Tea offe which was again moderate for the time of year.

Total Tea sold on Garden Account 1st June to date 1900, 649 pkgs., av. 7·70d. 1899, 651,384 pkgs., av. 8·53d.

CEYLON.—Supplies at auction have not been excessive. quotations current last week have been maintained with Some of the invoices have shown a tendency to fall off in qua The official wire gives exports to United Kingdom during Nove as 9,250,000 lbs. against 6,500,000 lbs. last year, making the from 1st January 103,250,000 lbs. against 99,500,000 lbs. same pe 1899. Average for week 7·45d.. against 7·68d. in 1899.

Ceylon Tea sold on Garden Account 1st January to date 1,144,570 pkgs., av. 7·21d 1899. 1,023,063 pkgs., av. 7·97d.

JAVA.—The selection, though small, comprised some attrac invoices, and competition for these was especially brisk.

Bank Rate 4 per cent. Exchange on London three months sigh Calcutta 1/4 7/32. Colombo 1/4¼.

COCOA.

No auctions were held on Tuesday. Privately the marke much more active than recently and about 5,000 bags of var growths have changed hands during the week at easy prices, —fine and superior Trinidad at 76s to 78s 6d, middling to good ditto at 70s to 73s. Bahia at 70s to 72s, and Guayaquil—good to Arriba at 78s to 82s 6d. greyish red Caraquez 75s to 76s per cw

COCOA POWDER.—At public sale on the 4th instant of 115 p ages offered only 25 packages Dutch sold at 9½d to 11½d per lb.

COCOA BUTTER is rather dearer, 600 cases (60 tons) Cadbu selling at auction on the 4th instant at 1s 6¼d to 1s 6¾d. ave 1s 6 9/16d against an average of 1s 6 3/16d per lb. obtained at the Nov ber sales. At Amsterdam on the same day 65 tons Van Hout sold under the hammer at an average of 86c, being a decline o on the previous prices realised.

COCOA SHELLS.—At auction on Tuesday D grade declined 10 15s in value, but other qualities were rather dearer. 1,640 (62 tons) Cadbury's sold—A at 92s 6d to 95s, B at 87s 6d to 90 at £5 10s to £5 12s 6d, and D at £13 10s to £13 12s 6d per ton.

PEPPER.

BLACK.—The market is very quiet, and values have tende favor of buyers. About 150 tons Singapore have been sold arrival, including January-March shipment (s.) at 6 5/16d to 6

d February-April and March-May at 6⅜d to 6 5/16d. On the spot és of fair Singapore at 6 3/16d to 6½d.

At auction on Wednesday 241 bags Lampong and 140 bags nang retired unsold. 10 bags shells sold at 2½d per lb.

The shipments of Black Pepper for the month of November, come as follows:—

	1st-half.				2nd-half.			
	1900.		1899.		1900.		1899.	
	Tons.		Tons.		Tons.		Tons.

Total ...		300		400		70		90

GINGER.

Cochin.—A break in the uninteresting line this article has followed for so long can at length be recorded, for there has been a ood business done privately since our last, some 1,500 bags washed ugh having changed hands at 27s to 30s for leanish to good fair, hich shows a rise of quite 1s per cwt. Under the hammer sales re confined to cut kinds, operators being unable to screw up eir bids to holders' ideas for washed or Calicut rough. 204 cases bags were brought forward, and 87 cases sold at rather lower ices—good medium cut and scraped 63s, medium, some small t rough, plumpish 45s, very dull ditto 43s, small ditto 39s to s 6d. For worked rough 29s 6d per cwt. bid and refused, which gure was also offered in vain for Calicut Sorts.

Japan is also dearer. 181 bags offered, and 26 bags sold—rough avily limed 29s 6d per cwt.

Jamaica very difficult to quit, and of 174 barrels catalogued only out 30 barrels sold—good bright 62s, middling to fair 45s to s per cwt.

CARDAMOMS.

Cardamoms.—403 cases offered about half sold:—Mysore @ Ceylon Tonacombe," very fine extra bold pale plump smooth 4s 2d to s 3d, bold ditto rather duller 3s 3d to 3s 4d; "Duckwari," very ne extra bold pale 4s 2d, bold ditto 3s 3d, bold medium ditto 2s 4d, nall ditto 1s 5d, extra bold splits 3s 5d; "Vedehette," extra bold le plump 3s 6d, bold ditto 2s 9d, medium ditto 1s 11d; very bold lish and yellowish 3s 4d, bold 2s 7d, medium 1s 11d; extra bold mp yellow 2s 11d to 3s, medium 2s 1d, small 1s 2d; small to ld palish and yellowish 2s 6d to 2s 7d, inferior ditto 2s 3d; extra ld long unclipped lean and greenish 2s, bold ditto 1s 6d to 1s 7d, edium 1s 2d; very bold brown 2s 5d to 2s 6d, bold 2s, medium 6d, small 1s 4d; good brownish medium bold 2s 2d, medium tto 1s 7d; medium badly clipped 1s 4d; medium bold dull llowish 1s 7d, small brown 1s 4d. Mangalore @ Calicut, bold le 3s 2d to 3s 4d, medium ditto 3s to 3s 1d, bold brownish 2s 9d. ild Ceylon, fair 2s 11d to 3s, rather lean 2s 8d. Seeds realised 6d to 2s 9d for fair to good and 2s 5d down to 2s per lb. for ordiry to common. Splits ranged from 1s 9d for good pale down to per lb. for common brown.

CINCHONA.

The N. V. Ned. Veem cinchona-bark department at Amsterdam ports the shipments during November from Java to Europe at 90,000 Amst. lbs., against 1,362,000 in 1899, 1,837,000 in 1898, 989,000 in 1897, and 909,000 in 1896. The total shipments from January to November have been

1900	9,680,000	1896	9,189,000
1899	10,783,000	1895	8,193,700
1898	10,132,000	1894	8,386,700
1897	7,706,000	1893	6,951,000

while the N.V. Vriesseveem cinchona department reports the shipments from Java from Ocober 30 to December 3, 1900, at 1,772,000 Amst. lbs., and from January 1 to December 3 at 9,548,408 Amst. lbs. For the five months ended August the exports from British India were:—

	1900.	1899.	1898.
Lbs.	1,491,484	1,253,288	761,486

The exports from Holland during the nine months ended November were:—

	1900.	1899.	1898.
Kilos.	371,500	407,900	337,800

In the drug auctions thirteen serons of Huanoco quill sold at from 6½d to 6¾d for lean to good bright, and seven serons Toxa good quill at 1s 6d per lb. Another lot of sixteen serons Huanoco grey bark sold at 6¾d and a bale of dark flat Calisaya was cleared at 3d per lb.

QUININE.

The slump in the second-hand market has been further accentuated this week by the failure of a speculator, who held, it is said, about 250,000 oz, which have been forced on the market. This fact together with the heavy bark shipments last month, have completely demoralised the speculative market, and quotations have gradually dropped to 1s. 1¼d. for December delivery, in which position a small business has been done, and for March there are sellers at 1s. 2d. It is currently reported that makers will be compelled to reduce their quotation, if, as quite anticipated, there should be a decline at the Amsterdam bark sale to-day. The opinion is expressed that makers would have reduced their quotations ere this, had it not been that they are exceptionally busy and that the "falling clause" was in operation on undelivered portions of contracts. There is now a discrepancy of 5½d. between the second-hand quotation and that of makers. American quinine manufacturers reduce their quotation on Wednesday to 32c. per oz. In the drug-auctions 2 cases of Howard's quinine sulphate, each containing 100 1-oz. vials, were offered and bought in.

[*Per Mail advices of 14th December* 1900.]

COFFEE.

The London Commercial Record says:—There has been rather more business transacted during the past week, but no general improvement in the tone of the market, and prices as a rule have again been against sellers, with the exception of a small supply of home trade quality Colombian which sold yesterday at a slight recovery. The market for "futures," under pressure of Continental sales, has been depressed, and latest transactions shew a decline of nearly 2s per cwt. for the week. Yesterday March Santos sold at 33s to 32s 1½d, May at 33s 1½d to 32s 10½d, September at 34s to 33s 3d, and December at 34s 3d to 33s 9d per cwt., closing 3d to 6d above the lowest.

To-day the sales went off with dull demand. Guatemala and similar qualities 1s to 2s per cwt. lower. Catalogues to-day comprised 167 bags East India, 324 bags Nyasaland, 138 bags Salvador, 579 bags Guatemala, 74 bags Colombian, 42 bags Nicaragua, 444 bags Costa Rica, and 2,870 bags unwashed Dumont.

HAVRE, *Dec.* 13.—Good average Santos December opened quiet at 39¼f. and closed quiet at 39¼f., March opened at 39½f. and closed at 39½f., May opened at 39¾f. and closed at 39¾f., September opened at 40½f. and closed at 40½f.

HAMBURG, *Dec.* 13.—Good average Santos December opened quiet at 32pf. and closed steady at 31½pf., March opened at 32¾pf. and closed at 32¾pf., May opened at 33pf. and closed at 33pf., September opened at 34pf. and closed at 34pf.

NEW YORK, *Dec.* 13.—Closing prices of No. 7 Rio were as follow:—

	Dec.	Jan.	Feb.	Mar.	April.
December 13...	5·65	5·75	5·85	5·90	5·95
December 12...	5·70	5·80	5·90	6·00	6·05

The public market will be closed after Wednesday, 19th inst., until Tuesday, January 8th, 1901.

TEA.

INDIAN.—Public sales were heavier, viz., 55,200 packages contrasted with 44,600 packages last week, and 44,400 packages at this period of 1899.

The position of the Market remains much the same as regards useful teas over 6d per lb., with an occasional hardening in price for desirable parcels. Under that, however, owing to the large number of uninteresting invoices, quotations were often lower to the extent of ¼d per lb. Fine and finest continued comparatively scarce and commanded attention, particularly a few choice Darjeelings. Arrivals from other districts, especially Assam, are not so good as shipments to hand in November.

For 47,300 packages on Estate Account 7⅛d per lb. was obtained against 8⅜d per lb. for 40,200 packages, and also for 30,800 packages in the two previous seasons.

From the statistics given below it will be seen that exports from here shew a marked increase, those for the past month being the largest on record and double that of the year before.

CEYLON.—Auctions included 21,800 packages *versus* 22,500 packages on the foregoing Tuesday, and 21,000 packages in the corresponding interval twelve months ago.

Common to fair leafy and broken kinds continue depressed, but there was again a strong enquiry for Pekoes and Orange Pekoes with full flavoury infusions, both from dealers and shippers, which passed as a rule in favour of sellers. Medium and fine Broken Pekoes and Broken Orange Pekoes for the most part went off well. Finest tippy lots were less plentiful than of late.

The average is 7⅜d per lb. On the 6th inst. it stood at 7⅛d pe and 7¾d on the 14th December, 1899.

JAVA.—Nearly 700 packages of direct import were submit There was a somewhat quite tone, and a considerable portion withdrawn owing to bids not being up to limits.

Deliveries.—The clearances of all Tea (on which duty has paid) from the London warehouses, as per official returns *viz.*:—

From 1st to 11th December,	1900	7,498,813 l
Do. do.	1899	7,239,270

During the week the following have been printed for sal public auction:—

57,268 *pkgs.* INDIAN
22,758 „ CEYLON
695 „ JAVA
} Total 80,721 packages were offered in p auction this week.

Recent low prices have certainly had the effect of stimula the use of British-grown Tea in markets outside the United K dom, the quantity of Indian Tea alone re-exported during Nov ber amounting to 1,714,437 lbs. against only 872,115 lbs. for corresponding month last year.

For the first eleven months of the year, 1900, there is an inc of two million lbs. in the re-export of Indian Tea, and of over and a half million lbs. in that of Ceylon when compared with corresponding period of 1899.

The Tea re-exported from the United Kingdom at the pre time goes mainly to countries in Europe, and it is satisfactor learn that the use of our Teas in those markets is showing a st increase, Russia especially appearing to respond readily to the l prices lately current for grades suitable for that important ma

INDIAN.—The week's sale was heavy, comprising 57,268 packa the market, however, was steady for all useful liquoring T prices for these showing here and there a tendency towards provement The lower grades, on the other hand, met with s what less attention and sold occasionally at slightly easier pr The following averages are worthy of note:—"Jungpunnah," 1 "Margarets Hope," 1/2½; "Con. T. & L. Bloomfield," 1/2¼, "Budla Beta," 1/1½.

Week's average of Tea sold on Garden Account, 1900, 47,596 p av. 7·02d. 1899, 40,639 pkgs., av. 8·32d.

Total Tea sold on Garden Account, 1st June to date, 1900, 69 pkgs., av. 7·65d. 1899, 692,023 pkgs., av. 8·51d.

CEYLON.—With moderate auctions, bidding was well distribu except for poorest liquoring Teas, which appeared to be some neglected, and in sympathy with Indian kinds showed slig easier rates; good and medium descriptions, however, were a st market and sold with good competition. The following aver may be mentioned:—Carolina T. Co. "Goatfell," 1/2½; and "T wakelle T. Co.," 1/-.

Average for week 7·38d., against 7·77d. in 1899.

Ceylon Tea sold on Garden Account, 1st January to date, 1,165,878 pkgs., av. 7·20d. 1899, 1,043,472 pkgs., av. 7·96d.

JAVA.—The few Teas brought forward were all of direct import. Although some lots were withdrawn for higher offers, the Teas were mostly sold at about previous quotations.

Bank Rate 4 per cent. Exchange on London three months, sight:—Calcutta 1/4 7/32. Colombo 1 4¼.

COCOA.

Values continue on the down grade, and at the auctions on Wednesday, when 4,085 bags were catalogued, a fresh reduction of 1s to 2s per cwt. was submitted to. Of 1,537 bags Trinidad catalogued 300 bags sold at 69s to 71s for good to fine red, being a good 1s down. Of 963 bags Grenada 270 bags found buyers at a depreciation of 2s per cwt., viz:—70s 6d to 72s for good to fine, and 67s for ordinary. Of 47 bags Demerara one lot sold at 69s 6d, the remainder being bought in. 14 bags the Jamaica sold, out of 170 bags catalogued, at 71s, or about 2s below valuation. Of 213 bags Dominica 4 bags common were quitted at 66s. 100 bags Bahia partly sold at 69s, whilst 2 bags bold grayish Carthagena realised 64s. Of 406 bags Guayaquil 140 bags greyish to red Caraquez sold at 72s to 74s, shewing a decline of 1s to 2s. Of 107 bags Colombian 16 bags common grey were placed at 60s to 65s 6d. 155 bags St. Lucia passed the hammer unsold. 485 bags Ceylon about a fourth part sold—fine bold and medium red 90s 6d, good ditto 83s to 85s 6d, and smalls 60s to 66s 6d per cwt, showing no material alteration.

PEPPER.

BLACK.—The market is dull in tone and value is lower. On the spot small sales of fair Singapore have been made at 6⅛d; for arrival 100 tons have been sold *viz.*, February-April shipment at 6 5/16d and March-May at 6 3/32d down to 6 5/16d.

Nothing offered at auction on Wednesday except 315 bags shells, dust, and stalks, which were bought in.

WHITE dull of sale. For arrival no business reported. On the spot sales of fair Singapore at 9⅛d and of fair Penang at 8½d per lb.

At public sale on the 12th inst., 52 cases 80 bags Singapore bought in at 9½d to 1s, whilst of 100 bags Penang catalogued, 61 bags fresh-water damaged sold for account of whom it may concern at 8⅛d to 8¼d per lb. 132 bags shells and dust retired unsold.

GINGER.

COCHIN.—Quite a brisk business has passed in this article since we last wrote notwithstanding the fact that some prominent men are abstaining from operating as the profess not to believe in the stability of the market. Nevertheless values steadily improve, the private sales this week of 2,000 bags including fair medium and small washed rough at 31s to 32s wormy ditto at 30s, small Calicut rough at 30s, and rough D's also at 30s per cwt. To arrive business has been done in new crop at 30s to 31s c. i. f. for unassorted. Under the hammer 27 cases 368 bags were offered but only 10 cases sold—good medium cut and scraped 62s 6d, small and ends, limed, 37s per cwt., being about steady.

QUININE.

Immediately after the Amsterdam cinchona-auctions last week the makers of German sulphate reduced their quotation 3d per oz. —now 1s 3d for 1,000-oz. lots in bulk. Howards' quotations in vials is now 1s 7d for 1,000-oz. lots. Since the official reduction the second-hand market has gradually improved, to the extent of quite ¾d per oz. from the lowest point touched last week, business having been done at up to 1s 1¾d for spot, March at 1s 2d, and May at 1s 2¼d per oz. To-day no business has transpired, the market closing with sellers on the spot at 1s 1¾d, and 1s 2½d for March. There are few sellers in second-hands. Quinine salts have also been reduced, the following being the quotations for the more important in 100-oz tins:—Hydrobromide, 1s 8½d; bi-hydrobromide, 1s 11½d; hydrochloride, 1s 8½d; bi-hydrochloride, 1s 10½d; benzoate, 1s 10½d; citrate, 1s 9½d; phosphate, 1s 10½d; salicylate, 1s 8½d; tannate, 11d; and valerianate, 1s 11½d per oz.

TANJORE DISTRICT BOARD 4 PER CENT. RAILWAY DEBENTURE LOAN OF 1901, FOR Rs.20,00,000.

The Tanjore District Board, which until recently has been joint owner with Government of the 54-mile Mayavaram-Mutupet Railway, has now become the sole owner of that line, having purchased the Government share of it, under the authority of Madras G.O., No. 402, Ry., dated the 12th March, 1900. As it stood on the books on the 31st December, 1899, the approximate value of the Mayavaram-Mutupet Railway was Rs.26,00,000.

2. The Board desiring to extend its railway, through Adirampatnam and Pattukkottai, to Arantangi, a distance of 46 miles, now asks the public to subscribe to a 4 per cent. debenture loan of Rs.20,00,000, to be secured on the existing 54 miles of railway as well as on the 46-mile extension to be built out of the loan which it is proposed to raise. The extension will be built by the South Indian Railway Company under the supervision and control of the Madras Government. The value of the entire railway, when completed, will be over Rs.50,00,000, and on this property the debenture loan will be secured as a first mortgage, pending its being paid off in due course by a sinking fund, as hereafter explained.

3. Interest on the loan, amounting to Rs.40,000 per half-year, will be secured on the Board's Railway income. This income has now for several years amounted to some Rs.2,00,000 per annum, out of which about Rs.1,00,000 per annum has been contributed by a special cess of 3 pies per rupee of land assessment, and about Rs.50,000 by the Board's moiety of the net earnings of the Mayavaram-Mutupet Railway. But now that the Board has become sole, instead of half, owner of the railway its income from that source may be expected to be doubled, and will, in due course, be further increased by the earnings of the extension.

4. After the payment of interest shall have been provided for as just specified, provision will be made for the ultimate payment of the debentures by setting apart, under the control of the Accountant-General, Madras, so much of the balance of the Board's Railway income as may be necessary for the formation of a sinking fund for their amortization at the close of the year 1920. The Accountant-General estimates that Rs.35,000 per half-year must be set aside and invested in Government securities for this purpose.

5. The Government of India have reserved the right of taking over the railway under reference at any time on twelve months' notice, by assuming liability for any debentures which the Board may have issued, and by re-payment of any money which it may have spent out of its own balances. The Government of India have definitely stated that this reservation will not affect the subscribing public, whose debentures will continue to run until maturity. Thus, if the railway should at any time be taken over by Government, subscribers to this loan will become the Government of India's, instead of the Board's, creditors. There is no intention under any circumstances of terminating the loan before the fixed date, *viz.*, 1st December, 1920.

6. Debentures will be issued for Rs 20,00,000. They will have a currency until the 1st December, 1920, and will bear interest at the rate of 4 (four) per centum per annu payable half-yearly in arrear on the 1st of June and the 1st December of each year. No interest will be paid before 1 June, 1901, although it will accrue as hereafter explained, fro date of allotment or of payment of instalments. The form debenture bond will be that hereto appended. Each debe ture will be issued for Rs.100 or for some multiple thereof.

7. Each tender must be expressed in the form given belo and, enclosed in a sealed cover and superscribed "Tender f Railway Loan," must be addressed to the President of t District Board, Tanjore. Forms of tender can be obtained application to the President.

8. Each tender must be accompanied by an earne deposit, in the form of currency notes or of a deposit recei from the Bank of Madras or any of its branches transacti business for Government, or any Government Treasury the Madras Presidency, for not less than 2 per cent. of t amount tendered. When a tender is accepted, the earne deposit will be held in part-payment of the amount tendere and, provided that the whole amount tendered is paid up the manner herein prescribed, will bear interest at the rate 4 per cent. from the date of acceptance of the tender. If a allotment after being made is not taken up, or if the fu amount allotted is not paid as hereinafter prescribed, t earnest deposit will be forfeited. The earnest deposits o non-accepted tenders will be returned without interest, o application accompanied by a duly stamped receipt.

9. The rate at which a tender is made must be specifie in rupees, or in rupees and annas. A tender not so specifie will be rejected as null and void. A rate must not contai fractions of an anna. Should a rate contain fractions of a anna such fractions will be struck out, and the tender will b treated as if the rate did not contain such fractions of an ann

10. In order to avoid mistakes a separate tender must b submitted for each rate tendered and a separate deposit mus accompany each tender.

11. The President of the District Board will be prepare to receive, and to consider on their merits, offers to exchang Government $3\frac{1}{2}$ per cent. paper for the Board's 4 per cen debentures, the Board taking the chance of Governmen paper rising in value between now and the date on which may hereafter be necessary to sell it for the purpose of sup plying funds for Railway construction. In such cases th earnest deposit required under para. 8 should also be in Gov ernment Promissory notes, which should be endorsed to th President of the District Board by their existing holders.

12. When an allotment shall have been made, th whole amount of each allotment must be paid in instalmen as follows:—

Instalment I.—Payable on or before the 12th Febru ary, 1901.

Must consist, with earnest money, o 30 per cent. of the whole allotmen

PLANTING OPINION.

A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VI.] MADRAS, SATURDAY, JANUARY 12, 1901. [No. 2.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 18th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

Munzerabad. *January* 1st, 1901.—*Crop*—coming steadily in, but ripening-up very slowly: a few places with bumper crops, the generality with moderate. *Plant diseases*—a little leaf disease. *Weather*—fine with east winds; on X'mas day, the wind turned and came from the west. *Health*—generally good.

Coorg. POLLI BETTA, 9*th January*.—*Weather*.—The East wind is *non est* this season. A good thing too. The cold, clear weather, too usual at this time, has been singularly absent. Clouds mostly sail by nearly every day. Coffee is keeping in wonderful heart, even where crops are heavy. This is due to the favourable S.-W. monsoon last year. *Crop*.—As a result of the coffee keeping in good fettle, the crop is ripening satisfactorily and contract picking is going on merrily. Crops are turning out well, samples being good nearly in all cases. *Labour*.—Sufficient. *General Health*.—Not satisfactory. *Prices of Grains*.—Easing.

AGRICULTURE AT COSSIPORE.

THOSE of our readers who are interested in the spread of Agricultural Education in India may usefully devote a few moments to the perusal of a brief account of the Cossipore Practical Institution of Agriculture, Floriculture and Agriculture. The title is somewhat imposing; the objects of the Institution are stated to be, to improve Horticulture, Floriculture, and Agriculture in this country and to popularize the conditions under which these may be practically studied by the natives of Bengal, or, for that matter, of India. To facilitate the accomplishment of these objects, means have been provided for conducting experiments with a view to produce the best specimens of flowers, fruits, vegetables and agricultural products. A number of students are maintained, with free board and quarters, and a monthly allowance of Rs.10 each, for studying the subjects both in theory and practice; and a Library has been established, containing many rare and valuable works on Botany, for the use of the students, as also of the general public interested in that branch of knowledge. Means, too, have been provided, though to a limited extent as yet, for the improvement of cattle by keeping bulls of the best Indian breed. Originally, a garden of about 30 acres in extent was provided at Ultadanga, on the eastern suburbs of Calcutta, but this was found to be insufficient, and a new garden of 35 acres has since been opened at Malhupore. The expenses of acquiring the land and laying it out for the purposes of the Institution were all met by the President, Babu HEM CHUNDER MITTER. The climatic and other conditions being favourable, the cultivation is being successfully carried on, in this branch garden, of such herbs and plants as are required for the Ayurvedic (Indo-Sanskrit) system of Medicine. Besides these, many specimens of fruits, vegetables, and agricultural products are being grown there that cannot be grown in the garden at Ultadanga. Already the branch garden has become a very valuable accessory to the accomplishment of the objects of the Institution. A similar garden is about to be established in the Hooghly district, near the native village of the President.

The Honorary Secretary states that ever since the foundation of the Association there has been a growing interest in Horti-Flori and Agri-culture among the educated people of India, and he attributes this largely to this example set by the President-Founder. He states that the knowledge of both Indian and foreign flora is gradually spreading among the upper and middle classes of the country; and we trust the statement is correct, for it is in every way good that the attention of a proportion of the rising generation should be diverted from the dry study of the law to the interesting field of natural science, especially in its botanical branches. The chief features of the garden at Cossipore are the cultivation of flowers, fruits and exotic greenhouse-plants; adjacent, is a plot of land where agricultural operations and experiments are carried on. There are two gardens at Ultadanga within

a short distance of each other. These gardens are well stocked with plants of different varieties, selected fruit and flower trees, and ornamental plants collected from different parts of the country. Great pains have been taken to collect and cultivate medicinal plants used in the Ayurvedic system of treatment. This feature of the gardens has enlisted in their behalf the interest of medical men and students of Botany in general. Besides these gardens, there are two branch farms in the district of Sonthal Perganahs. Here experiments are constantly being made in connection with new and rare varieties of fruits, flowers, and vegetables. Experiments are also said to have been made with the following crops: Paddy, Maize, Sunn hemp, Chait-Arahar, Sugarcane, Guinea-grass and Jowar. This shows that the agricultural branch is not being sacrificed to the more fascinating study of flora, medicinal plants, etc. It should be specially mentioned that the Institution aims at the development of the Indian system of Horti-Flori by introducing the improved, scientific methods of the West. By imparting practical and theoretical lessons free of charge, it interests and trains individual students; by holding annual Flower Shows and Agricultural Exhibitions it enlists the interest of a good many of the public.

We need not place before our readers details of results of experiments; but we note from the report that various of these were very satisfactory. Indian corn of the Patna variety was grown all the year round and was much better in outturn than the American corn acclimated. Sugarcanes—Khari, Sámsárá, Kájlá and the Bombay variety—gave good outturns. Carrots from acclimated seeds were raised; the outturn was heavy; one biggah having yielded 120 maunds. There was a great demand for the crop from horse-owners and the people of the North-West Provinces, who use it as food for themselves. Guinea and Elephant grass were continued to be cultivated on the same plot of ground. No manure was applied or special care taken, but the grasses grew luxuriantly, quite regardless of the neglect of treatment. Native vegetables and pot-herbs were cultivated in order to obtain the best seeds. A collection of horticultural plants from Europe and America was added to the stock. The propagation of Mangoes and other good fruits and various fragrant flowers was carried on vigourously to meet the heavy demand for them. A large quantity of Rhea roots was supplied during the year to the planters than in the preceding year. The large stock of different medicinal plants enumerated in the Hindu Ayurvedic medicinal books was revised and extended in the Ultadanga garden and labelled for identification. The whole Institution, it will be seen, is not on a very large scale, but it is especially notable, as an instance of well-directed enterprise on the part of an individual. The President-Founder, Babu HEM CHUNDER MITTER, is said to have expended on this experiment, during the last twelve years, not less than three lakhs of rupees. It is not surprising that the Committee should now have pointed out that some measure of State aid is necessary to ensure the permanency of the Institution. For us, the chiefinterest attaching to it lies in the fact that it sets an excellent example before planters in Southern India. For the most part, they neither conduct experiments themselves on scientific principles nor heed suggestions that they should combine to start experimental gardens for the benefit of the community generally. We cannot but think that they might learn a useful lesson from Cossipore.

THE LATE MR. RALPH TATHAM.

Owing to the editor's temporary absence, we omitted to ref last week to the sad news of the death of Mr. Ralph Tatha of Tellicherry, Agent to Messrs. Arbuthnot & Co. Qui recently Mr. Tatham embarked for home in consequence ill-health; but, we regret to say, he died on the voyage fro an affection of the heart. Mr. Tatham was the eldest son Mr. Ralph Tatham, formerly of Ceylon. His father was lo connected with Major Skinner and the Public Works Depa ment. He married the elder daughter of the Hon'ble Saunders, Treasurer, sister of Sir Frederick and Messr Henry and William Saunders. Mr. Ralph Tatham (junio after being for some time in a mercantile office in Colomb got the appointment from Messrs. Arbuthnot & Co., Madras, as their agent at Tellicherry and no more trus worthy agent has firm had. He worked well for them f many years and his death has caused a gap that will not easily filled. Popular among planters, Mr. Tatham was de to all who knew him, and his genial presence will be great missed not only at Tellicherry but in the many distric where he was a welcome, if all too rare, visitor. Especial will he be missed on the West Coast, where he had do much to advance both commercial and social interests.

THE OVER-PRODUCTION OF TEA.

In a letter to the Colombo press Mr. Edward Roslin suggests a remedy for the over-production of Tea. We fe it is one of the impracticable order. He remarks that t three possible methods suggested for reducing our crops are —(1) Finer plucking which would tend to reduce the outp whilst giving a better quality of tea. (2) Making a certa percentage into green teas. (3) Resting a certain percentag of the acreage in bearing. The first two are easily dismissed —"The objection to No. 1 is that we should probably ha too much fine tea produced with a corresponding fall in i value and directly the better and poorer classes of tea appro imated in value, there would be a tendency to pluck coar again. The objections to No. 2 are (*a*) the green tea mark is not as yet sufficiently developed to afford material relie and (*b*) the difficulty of making both black and green teas the same factory." Mr. Rosling then points out the advan ages of No. 3, saying "if you do not pluck a field for certain number of months, you rest your bushes and you ca hardly bring them into plucking again without pruning, th doing away to a certain extent with a possible temptation break out of the combination. The net result would be reduced yield and improved bushes." He therefore propos that all estate proprietors or their agents in Ceylon and Ind be asked to rest 10 per cent. of their acreage in bearing f two years from the 1st April, 1901, to 31st March, 190 This arrangement to be subject *to at least* 80 per cent. of t acreage in both countries agreeing to it in writing. N doubt this would have the desired effect in checking produ tion, but we greatly doubt if planters can be got to adopt t system proposed. It involves an immediate sacrifice on t off-chance of future gain; and its success is largely depende upon the example being followed in India, where planters not readily bind themselves all to take a certain course.

NOTES.

ychelles Vanilla.

The crop for next year is variously estimated at from 50,000 to 70,000 kilos.

he Indian Museum.

Mr. Lionel de Niceville, Clerk of the Court of Small Causes, Calcutta, as been appointed Government Entomologist in the Indian Iuseum.

ver-production.

Some Indian merchants in London are considering the advisability of a cheme for the curtailment of the Indian and Ceylon tea crop, ut it is feared to be not feasible. We should say not.

ailure of a Big Tea Firm.

A receiver has been appointed to wind-up the affairs of Messrs. Cooper, Cooper & Johnson, Limited. The recent annual report of he Company showed that things were not prospering.

erman Quinine.

The exports of "quinine, quinine preparations, &c.," from Germany or the nine months ended September, were :—

	1900.	1899.	1898.
ilos. ...	137,700	160,600	146,300

he British Tea Duty.

Among "Proceedings" in our present issue will be found an interesting report of a debate at a meeting of the Planters' Association of Ceylon with regard to the suggested reduction of the British Tea Duty.

dulterated Pepper.

The Local Government Board in England reports that certain samples f so-called pepper, taken during the year by Inspectors of Food, contained as much as 40% of Indian corn. The analysts ad not previously met with this form of adulteration.

Iexican Notes.

The Tabasco Commercial Co., with headquarters at Springfield, Massahusetts, is developing a tract of 15,000 acres in the state f Vera Cruz, Mexico, between Coatzacoalcos and Frontera, utting mahogany and preparing to plant rubber and other rops.

he London Tea Market.

Cabling to Colombo on the 3rd instant, Messrs. Gow, Wilson and Stanton reported a generally steady market. Average of Ceylon Tea, 7½d. *Reuter* stated that 20,000 packages Ceylon's were sold out of 22,000 offered, and 23,000 packages Indian's ut of 25,000 offered. Average price of Indian, 7⅛d.

alcutta Tea Sales.

The first sale in the new year took place on the 4th instant; 17,000 packges were offered, and practically all passed the hammer. he catalogues included a large proportion of reddish mixed af. The sale passed off with more spirit. Medium to desirble kinds were a little dearer, but the commonest descriptions ontinued to sell at very low quotations.

ea in Switzerland.

The consumption of Tea in Switzerland makes but slight progress. Notithstanding that the year 1899 was one of the best tourist easons, the value of imports of tea declined from 46,000 lbs. 1898 to 43,000 lbs. in 1899. Indian Tea showed an increase of 1,000 lbs. (total import 4,300 lbs.), while China Teas decreased 4,000 lbs. (total import 37,000 lbs).

A Panama Rubber Plantation.

The rubber plantation of the Las Cascadas Plantation Co., Limited, is situated at Las Cascadas, in the district of Emperador, department of Panama, republic of Panama. This plantation has been in existence since January, 1890, when the then proprietors planted 40,000 India-rubber cuttings, none of which has yet been tapped, and they have been adding to these year by year. They also have a large quantity of coffee and cacao trees, the majority of which are now bearing.

The late Mr. A. C. Griffin.

The *Nilgiri News* recently announced the death of Mr. Albert Charles Griffin, at Kotagiri, on the morning of New Year's Day, at the age of 48. The deceased was a planter for many years on the Nilgiris and in the Wynaad, notably on the Seaforth Estate, in which property his uncle, the late Captain Griffin, was a part-owner. Latterly Mr. Griffin was in charge of an estate in the Nelliampathies, where he contracted malarial fever, which ultimately took an enteric turn and proved fatal.

Quinine Lygosinate.

This new quinine salt is the outcome of the experiments made on the sodium salt of the acid by Fabinyi, and is prepared by the interaction of sodium lygosinate and quinine hydrochloride. The acid has the constitution of a diorthocoumarketone, and the formula of the new salt is $(C_6H_4)_2C_5H_4O_3(C_{20}H_{25}N_2O_2)_2$. It is an amorphous orange-coloured powder of aromatic odour and somewhat bitter taste. It is soluble in alcohol, but only to a slight extent in water. It melts at 114°. It possesses a very strong germicidal action.—(*Ph. Post*, 1900, 598.)

Localisation of the Cinchona Alkaloids.

According to Dr. Charpentier (*Ph. Post*, 1900, 600) microscopic analysis is usually not sufficient of itself to discriminate between wild and cultivated barks. The tannin vessels, which are much more numerous in the leaves than in any other organ, contain practically no alkaloid. The highest percentage of alkaloid is found in the root, the best tissue being poorest in this respect. Traces only were detected in the phloem parenchyma. He states that the leaves contain sufficient alkaloid to justify their being employed as a tonic and febrifuge.

Cooly Savings.

Says the *Ceylon Observer* :—If Indian coolies do not carry away to their *Sheemai* as much in savings as they did in the old coffee days, their Kanganies manage to secure far more in the way of advances. Here is what a paper reports of emigrants to the West :—"The Emigration Agents for British Guiana announce the interesting fact that the total savings brought back to India by emigrants returning from this

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nicholson's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf people, unable to procure the Ear Drums, may have them free.

Address—No. 989 D, THE NICHOLSON INSTITUTE,
Longcott, Gunnersbury,

colony amount to over a crore of rupees. The ship *Ban*, which is expected in Calcutta on Christmas Day, brings coolies with more than a lakh of rupees to their credit."

Colombo Tea Sale.

The first Colombo tea sale of the new century was held on the 4th instant, and in consequence of the holidays, the catalogues were unusually heavy. The auction began at 10-30 A.M., and with an adjournment of three-quarters of an hour for lunch, closed at 7 P.M. Mr. Jas. Forbes, of Messrs. Forbes and Walker, offered for sale with the small lots one box golden tips, containing 3 lbs., which fetched R.3 per lb., at which price it was purchased by Mr. Seneviratna, a native buyer. The *Times of Ceylon* says, at the public sale of tea at the Chamber of Commerce room yesterday, about 18,227 pkgs. = 1,401,630 lbs. were offered, of which about 14,813 pkgs. = 1,139,477 lbs. were sold.

Tea-growing in Hungary.

The example of Russia has inspired Austria-Hungary with a belief that she can "grow her own tea." On the initiative of Count Zichy, who recently returned from a tour through Asia, the Hungarian Minister of Agriculture ordered that trials should be made in various parts of the country with tea plantations. With this in view, large quantities of seeds, together with about 1,000 tea-plants, were imported from Shanghai; but, notwithstanding the utmost care, the plantations have been failures. According to experts, when the selected plants arrived at Fiume, they were more fit for burning than for planting. The Agricultural Department has not yet given up the hope of obtaining favourable results, and has decided to make fresh attempts; for which purpose plants have been brought over from Tiflis. These have been distributed throughout Hungary to the State nurseries.

The San Jose Scale.

It is significant that the First Assistant Entomologist to the U. S. Department of Agriculture now regards the San José scale as a permanent factor in fruit-growing. Extermination is possible only where the scale is detected at the very outset on new or recently planted nursery stock, or, at least, before any considerable chance of spread has been afforded. The experience of California has demonstrated that this scale insect can be controlled, and the more recent experience in the east points indubitably to the same conclusion. By proper repressive and remedial treatment, an orchard can be protected from serious injury and kept in a good paying condition so far as influenced by the San José scale. One of the most effective and oldest remedies for the control of the San José scale is the lime, sulphur and salt wash. There is nothing better in California and similar climates, but in the east the frequent rains and moister atmosphere render this wash ineffective. It would be interesting to note the effects of a similar wash upon scale pests in this country; but what might be effective in an orchard would probably fail utterly on a coffee plantation.

Quinine in Italy.

A Bill is being brought forward by Signor Boselli and Baron Sonnino for regulating the sale of quinine. This measure proposes that authority should be given the Minister of Finance to buy bisulphate and hydrochlorate of quinine, and to sell it in the ordinary State tobacco and salt shops at the price of 50 centimes (5d.) per packet, containing either 3 grammes of bisulphate or 2 grammes of hydrochlorate. The quality of quinine must be of the purest, and the packages must be d up in a way approved by the Superior Council of Sanitat The Bill makes provision for the increase or diminution of price of the packets in case the market value of quinine r or falls more than 25 per cent of its price at the time of passing of the law. The Minister of Finance is furt empowered to entrust the preparation of the quinine to or more private firms by a contract lasting not more than years. The object of this Bill is to place the means of c bating all forms of fever within reach of the peasants over the country. Tobacco and salt are Government mo polies in Italy, and shops for the sale of those articles at fi prices exist even in the tiniest and most out-of-the-w villages, where often no chemist lives, or where, if he li quinine can only be bought at high prices and of infe qualities. Now that the discoveries with regard to the r tion between mosquitoes and malaria, and to the importa of administering quinine to sufferers from fever during non-malarial months of the year, have made it more t ever necessary that the supply of good quinine should available everywhere, and at cheap rates, the importance the Sonnino-Boselli Bill is generally recognised.

LETTERS TO THE EDITOR.

PREPARATION OF COFFEE FOR DOMESTIC U

In regard to the preparation of coffee for a table bevera I have consulted many authorities and venture to think t the following extracts from *Chambers's Encyclopædia* cont the most reliable information :—

"When the beans are roasted till they assume a reddish-br colour, they lose 15 per cent. by weight and gain 30 per cent bulk; when further roasted till they become chestnut-brown, t have lost 20 per cent. by weight and increased 50 per cent. in b while if roasting is continued till the beans become dark-bro they lose 25 per cent. in weight and acquire 50 per cent. in bul

"In Britain, coffee is usually under-roasted probably in orde escape the loss in weight, but in France, Norway, Germany, other countries, where it is roasted at home by the consumer, roasting is carried to the dark-brown stage."

"The writer who has watched the domestic roasting of coffe many countries attributes the superiority of the infusion mad these countries mainly to this and the use of freshly roasted ground coffee"

"The important offices which coffee fulfils are, to allay sensation of hunger; to produce an exhilarating and refresh effect; and, according to some authorities, to diminish the amo of wear and tear, or waste of the animal frame, which proceeds m or less at every moment."

"An endless variety of apparatus have been contrived, som them of great complexity,—for preparing coffee for the table. chief object aimed at is to obtain the liquor free from sedim The simplest and cheapest device is that of placing a bag or m strainer, by means of a suitable rim,—in the upper part of the co pot, placing the ground coffee in this and pouring boiling w through it. Or the ground coffee may be simply placed in a sa pan or coffee-pot, hot water poured upon it and boiled for a minutes. The chief effect of adding chicory to coffee is to de the colour. The question whether coffee should be boiled at a simply infused has been much discussed. The writer has obse that in countries where pure coffee is used, boiling is practi in favour. This suggested some experiments which have sh that pure coffee is improved by two or three minutes boiling, w chicory is rendered bitter and unpalatable by such treatm Soyer recommends that, before the boiling water is poured in sauce-pan should be set dry on the fire and the powder stirre it is quite hot, but not in the the least burned"

Mrs. R. Temple-Wright, in her useful little book "Baker nd Cook," says :—

"The Criterion (Arndt's patent) made of black tin, price Rs. 4/8 be had from Messrs. S. E. Thompson, Ironmongers, Calcutta, nd from almost all European shops, makes excellent coffee. But his gives you only an infusion like tea, and coffee is perfect in avour only when boiled."

A lady-friend of mine has kindly made several experiments o ascertain how much coffee is required for ordinary house-old use. The conclusion arrived at is as follows :—

Raw coffee, when selling at 1s. 8d. per pound in London, oses 25 per cent. during the roasting operation, therefore he outturn of one pound of raw coffee will be $\frac{3}{4}$ of a pound, o that one pound of roasted coffee would cost 2s. $2\frac{2}{3}$d. and would make 64 cups of the beverage at $\frac{5}{12}$ths of a penny per cup.

Raw coffee, selling at 1s. per pound, would, therefore, cost 1s. 4d. per pound when roasted, and would make 64 cups of good coffee at one farthing per cup.

An experienced French cook once informed me that his special success in making delicious coffee was the result of putting a little finely powdered crystalline sugar into the roaster when it was removed from the fire and revolving the roaster for a few minutes, so that the berries might be partly coated with the sugar so as to prevent the aroma from being lost.

When in England I purchased at the Agricultural Hall a most excellent contrivance which thoroughly performs the duties of either a tea or coffee-pot. Its advantages consist firstly in the lid being fixed so as to open forward, instead of backward, and, secondly, in the ingenious arrangement of a diagonal sheet of perforated gauze, which not only most effectually prevents any tea leaves or coffee sediment being passed into the cup, but absolutely precludes the possibility of any of the liquid in the pot spilling while being poured out, owing to the strainer being the full height of the interior of the pot and the peculiar position of the lid and the opening which it covers.

I also inclose an instructive cutting from the *Daily Graphic*.

"PURE COFFEE."

[INCLOSURE.]

"FRENCH COFFEE"—AS DRUNK IN ENGLAND.

SIR,—A story is told of a Frenchman who did not think much of the roast beef of Old England. He told a friend that hearing a man with a hand-barrow shouting out "meat meeeat," he purchased some of the "meat" from the itinerant vendor and found it far from satisfactory. Similarly, we Britishers form a very wrong impression of coffee in general, and "French coffee" in particular, from the stuff sold in bright, showy tins with "attractive labels." I enclose an advertisement from a trade journal—honest in its way—which describes what "French coffee" is (in England). If housewives would take the trouble to purchase good, raw coffee and have it freshly roasted, or, at least, buy it roasted whole, and grind it as required, one of the best temperance drinks would undoubtedly be brought into extensive use, to the benefit of everyone interested in health and temperance.—Yours faithfully,

S. C. T. A.

FRENCH COFFEE.

The most attractive label in the trade, customer's name and address printed thereon for orders of 23 lbs. and upwards, duty paid.
Coffee with 40 per cent. chicory, 1-lb. and ½-lb. tins.
Coffee with 40 per cent. chicory, ¼-lb. tins, cream and chocolate label.
Coffee with 50 per cent. chicory, 1-lb. and ½-lb. tins.
Coffee with 50 per cent. chicory, ¼-lb. tins, blue and chocolate label.
Coffee with 65 per cent. chicory, 1-lb. and ½-lb tins.
Coffee with 65 per cent. chicory, ¼-lb. tins, red and gold label.
Coffee and chicory, in tins of 14, 28, and 56 lbs.

"FOXY COFFEE."

DEAR SIR,—In reply to Mr. Percy G. Tipping's letter, in your issue of the 5th instant, I should put "foxy coffee" down to want of fermentation in the vats.

"Foxy coffee" invariably is found in the earliest picking and is caused, in my opinion, by the small quantity of pulped coffee placed in the fermenting vats, there not being sufficient to get at a healthy fermentation. I don't know whether other planters have found this the case.

A. L. ALEXANDER.

GENERAL ARTICLES.

THE INDIAN TEA INDUSTRY.

"Camellia" writes in the *Pioneer* :—

Mr. Leslie Rogers' papers recently published in the *Pioneer* are in my judgment full of sound counsel and advice. He has touched pointedly and not unsuccessfully at one particularly objectionable feature of the times in tea. I refer to the weeding out of good men for bad ones. Of course the sage directors of tea companies do not put it that way: to them it appears as a matter of reducing expenditure. But they none the less expose their ignorance and stupidity by arguing as they do, that a cheap man reduces expenditure: he is much more likely to reduce receipts, and eventually to wreck the garden. But there is no good in gainsaying the fact, there was and still is in tea a number of gentlemen with a facile tongue, a big head, and very little in it. In tea it is high time of day they were once for all unceremoniously kicked out of it. If men of experience, keen and long observation and intelligence cannot make gardens pay: it is the perfection of folly to suppose that a much inferior man on a low salary will. Although Mr. L. Rogers has hinted and not obscurely either that some of these latter apparently by finesse are able to very materially increase their material wealth not covered by the modest salary they draw, this is an insinuation that needs no amplifying to be understood.

We, of course, are all aware of Mr. Rogers' Dehra Dun affairs from the full publicity that was given to them and some might think here and there a tinge of it has crept into his papers on tea. I should say, however, that his observation on the point are distinctly to the point. For myself, however, I may say at once I speak from a wholly independent position with no personal grievances good, bad or indifferent to air. Directors will more and more discover that cheap more or less empty-headed management is a sorry kind of panacea for resuscitating the exchequer of tea companies.

But I apprehend the time is not just yet. As competition gets a little keener, plainly enough discernable to those who know full well of the considerable acreage of new tea that comes fully into bearing during the ensuing two years, to say nothing of the very large acreage of tea developing in the Travancore District: when the general average gravitates anywhere between 4d. and 6d. per lb. then will be the period of woe and lamentation for those gardens with crude management.

The weeding out of these men in tea I would, however, characterise as a small matter. But the agents, directors, transit companies, dock, and warehouse men I contend are main factors to be dealt with to-day. It was only the other day the Hon. Mr. Buckingham conducted a rather lengthy argument to shew that even in the matter of carrying specie the Assam River Companies scented a good deal more than those companies where tea does not grow. Again the Shipping Companies charge 10s. per ton more for tea than other ordinary produce I believe, and perforce because of this, or what, what is for? The Tea Association must needs enter into an agreement demanding a no less than two years' notice of termination of contract. Now about this contract, I would like to know whether those tea carrying compaines carry anything that can be more compactly put up, more absolutely regular in shape, form, and cubic contents, whether indeed there is anything they handle more expeditiously and cheaply embarked than tea?

And if this is so why this extra 10s. per ton? The warehouse men have, I believe, recently reduced charges no less than 20 per cent. Could anything be more eloquent of the extortionate charges that existed and still exist. Is it not a fact they charge 3½d. each for weighing up empties?

Now for a few words about those great men the Calcutta agents, brokers, etc. A former communication the *Pioneer* was good enough to publish, drew forth the observation from a planting journal that in substance the aforesaid agents, etc., were a highly honourable set of men: a superfluous observation, because, I think, no one ever said they were not. But why this ridiculous touchiness, and trashy sentimentality in tea. Is the rude awakening not sufficiently near at hand for honest men to speak up, and speak out? and not at mere babes and sucklings: but at the exploiters of tea as a manufactured article and those exploiters are agents, brokers, shippers, dock, and warehouse men: let all these fall into line in conformity with an article reduced from a modest Is. to well nigh 6d. and still on the downward path, and great good will result to the industry. But when all has been said relative to the above factors, virtually the greatest sinners are the confiding gullible shareholders, who in a surprising manner swallow the plausible statements of mere ornamental directors, many of whom have never seen a tea plant even: but have not the smallest objection to fees ranging from £2,000 downwards. I adhere to all I have said on the subject of tea, there is nothing more badly managed in India, and nothing in the commercial world to-day more unjustly exploited. And the time has surely arrived when the matter should be energetically thrashed out: and the tea share-holding public can do yeoman service at this time by a full awakening to the fact that the day has gone by when they should trust implicitly interested agents, and fee-drawing directors. One of their most contemptible arguments is the weather, and the reader who cares to study the language of tea company directors will find the weather is their one great apology: a more miserable argument was never so sedulously ridden to death. Does not the weather exist for everything else as well as tea, and can it be altered by an iota? and if not, why cover incompetence, and a string of excessive charge with this *deus ex machina*.

I counsel every tea shareholder to strenuously insist on reduction of agents' commissions, brokers' commissions, and to fight the warehouse men and shipping companies persistently, and to insist on shelving mere figurehead directors. Tea demands intelligence, and sustained keen observation, from the plant to the consumer, and if the ignorant tea-planter should be got rid off, so too should the wholly inexperienced director in favour of men, or at all events one man to each company, the *sine qua non* of whom should be knowledge of the subject in all its bearings and unswerving attention to the company's interest.

But so long as many directors are also the agents, or connected with agency firms and as has been shown with the dock and warehouse people and the shipping companies in several instances: and so long as agents are allowed to finance the gardens, so long will a large number of companies have to pay through the nose, and take the residue which, as nigh a hundred companies shew, is *nil*. There is just one other matter I should like to touch on. In a former paper I animadverted on the Tea Association: a correspondent of a planting journal opined I either did not know, or forgot this Association was largely composed of the Calcutta agents. Let me assure him I neither forgot, nor was in the least unaware of the fact. He seems to have somewhat missed the sarcasm of my observations on the Association. I have here one proposition to make which is this, that the name of the Tea Association be changed to that of the Tea Selling Corporation. As an institution for surveying the tea industry as a whole it is absolutely defective: its operation are virtually that of a superior set of shopkeepers: whereas the crying need of the industry is a great and united council for tea in all its manifold bearings. If this were in existence we should at least be spared the ridiculous fiascos that break out in tea every now and again as, for example, asking the post office to sell teas for them.

Neither probably would the Government of Assam have come forward with the astounding sentimental, and impracticable proposition for increasing the wage of coolies, when tea never was so low in price, and when there never were so many companies paying nothing, and when it is almost a dead certainty unless a few scores of companies go to the wall, or unless the foreign markets make much more headway that tea has not reached the minimum. I say unless these things happen the woe and lamentation is just ab two years ahead.

But I would beg not to be put down as a croaker in the mat only that it is high time this house of tea was founded on so thing more than random methods, and the dustoorie of 50 years a Planters and very largely British capital have literally m Assam, yet by the planters' stupid *laissez faire* policy it is possi for some of the impractical doctrinaires of the Government to co in uncalled for and propose an increase of coolie wage at the v time when tea is least able to bear it, setting aside the exceedin doubtful question as to whether the coolie is worth more, or is even now overpaid.

BRAZILIAN NOTES.

(From the *Brazilian Review.*)

Sao Paulo.—The cultivation of coffee and sugarcane is increas in Lençóes.. The crop of the former for this year yielded ab 20,000 bags, while, 1,500 pipes of rum were produced; farms changing hands at good prices and trade is generally improving

Coffee—*Santos, November* 24th, 1900.—The persistent and conti ous fall of the price of coffee in the consuming markets could pass without disturbing primary markets also, thus we experienc a sharp decline here yet dealers and planters resisted as much possible, and only the strictly necessary was sold in order to be a to meet engagements.

The amount of coffee sold at these low prices, therefore, is large. On the other hand, it must be stated that on certain da had there been any large offerings of coffee, prices would have ceded by leaps and bounds, as buyers were shy in absence of orde

Only during the latter part of the week larger orders came fr Havre, of which part only were executed. To-day with small in rior arrivals, 22,000 bags only, the market here reacted immediat and an advance of from 200 to 300 réis was paid in an insta This shows how dangerous the position is, as there must be a c tain short interest at these low prices here, although it cannot large, but the short interest in consuming quarters must have sumed considerable proportions, always taking into considerati the much lower basis of prices reached.

We quote:—6$100 to 6$500 for *superior* during the week. T first mentioned price ruled on Thursday and Friday, to-day 6$250 6$300 were reached on account of smaller arrivals and larger orde of which, being at a low figure, very likely nothing could be exec ed, although exchange was weak and declining. There was special demand under the circumstances, cheapness only induc exporters to buy.

The big American houses are out of the market at present, th will probably buy cheaper in New York, where a merciless drawi out of the weaker element must have taken place, as it was t weakest market of all.

Arrivals showed already during the week signs of decline a the natural falling off, in combination with the low prices, make prediction of smaller receipts fairly safe.

Prices approached during the week the lowest level seen last ye followed however by a sudden, formidable, and irresistible rise. W do not think this will repeat itself this year, but a rise to abo 7$000 in a short time seems probable.

The demand from the States was *nil*, from Europe there we large orders, specially from Havre, at 32s. to 33s. 6d. for go average and 33s. to 35s. 6d. for *superior*. At the higher prices certain quantity has been contracted for shipment.

Exchange—*Rio, November 26th,* 1900.—Ninety days' rate London opened on Monday, the 19th instant at 10 1/2 to 10 15/32 but after keeping pretty steady all the week finally gave way Friday, and closed this evening weak at 10 1/16d.

The position since we wrote last week has undergone a profou change, not only has the advent of the Republica been through discounted, but the steadying effect that was anticipated from presumed ability to draw for a considerable sum without cover h not come up to expectation. The present weakness appears, ho ever, to be of a purely speculative character, the result of coveri sales to some of the foreign banks made during the early part the month which refused to take Republica paper.

A good many operators, consequently, who were pretty full this paper were obliged, not only to buy again for delivery, but

t rid of Republica paper on its own terms. This held the rate few days, but as soon as it was done, rates gave way and market kers getting alarmed rushed in as usual and helped the slump. here is no doubt, however, that the feeling has changed and is w decidedly "bearish." Too much was expected from the Banco Republica, people forgetting that it is the banks' function not boom or to burst the rate, but to keep it as steady as circumances will permit, without tilting at brick walls. To Government really does not matter what the rate is as sufficient gold revenue ill be secured by the 25 % duties that will next year be payable gold to guarantee foreign payments independent of exchange. deed, with coffee prices so weak abroad, it would be positively inous to push exchange upward now but, in our opinion, equally ngerous to let it drop. Currency prices have nearly reached bottom and unless exchange fall too, the chance of a much wer sterling quotation abroad seems likewise improbable. For ery reason, the rate should, we think, be maintained if possible ecause any sign of weakness will, with such heavy actual entries coffee and the prospects of breaking the record next year, be tilised by operators in foreign markets to "bear" sterling coffee rices. So long as 8$ or 9$ can be maintained as the minimum ere and exchange kept from falling below 10d. as it may be, e believe, without great difficulty, planters may, it is true, suffer, at they are bound to do in any case but every other kind of busiess will be the gainer by stability. . . .

There is, as far as we can see, no occasion for alarm. Bears may y to forcerates down, but money is scarce and bills fairly plentiul, and the banks coming to the end of their tether. If there were lenty of money or the situation would allow of a safe bear deal a ig slump might be, under the present depressing circumstances, far om impossible, but as it is, we believe, that the scare is nothing ore than one of the squeezes that the banks know so well how to reate and even the victims appear to enjoy. As soon as it is over, nless something rabid occur in the economico-politico line we see o reason to change the opinion we have expressed that exchange ill be steady or perhaps rising up to the end of the year at least.

Aggregate entries for the crop at Rio show a decrease of 401,452 ags compared with last year's, but at Santos an increase of 624.147 ags, so that taking both ports together this crop to date has surassed by 222,695 bags that of last year.

COFFEE IN LONDON.

The London Commercial Record of 21st ultimo says :—

The week previous to the Christmas holidays has closed quite in ccordance with the general expectation, for it has been true to its raditions—very dull and uninteresting. Next to no business has een transacted, and when goods have actually changed hands, the eller invariably has been the loser. Bears throughout the week ave been successful in almost all branches of our trade, but they y claim to an exceptional score in the case of coffee. After having xhibited signs of great weakness for some time past, our terminal harket experienced a veritable slump last Tuesday and Wednesday, hen prices for Brazilian failed to resist the enormous pressure of xceptionally heavy supplies—25,000 bags—and registered a decline f about 2s. per cwt. Such a drop being absolutely unexpected aused some amount of consternation in our market, and frightened any holders into clearing out of their stocks. Bad as the effect as been on the minds of our operators, what must it have been on he spirits of the Hamburg bulls? They are certainly having a very ncomfortable time of it at present, but the lower we go the greater, f course, the chance of an early recovery; the only question is hether Hamburg holders will prove themselves strong enough to ear the heavy loss they have so far sustained. On this point there s, of course, a difference of opinion. Rumours of serious difficulties upposed to have arisen in the banking world of Germany, princially Berlin, have been spread by some of our daily contemporaries, nd have found a willing ear on this side of the Channel. If they hould prove to be correct, the unlucky "bulls" of coffee may find ore trouble in tiding over the present trying time; but not only hat, a crisis, or even failure, among German banks would undoubtdly involve the bankruptcy of many of the Hamburg operators, r not only their financial support would cease, but also any credit alance they may possess at any of these banks might be transferd into a doubtful liability on the part of the failing banks. The outlook in Hamburg, therefore, is not a very bright one, and it is terrible to think what fate would be meted out to coffee were the holdings of German bulls to be thrown upon the market. However, this would represent the darkest side of the position. The German banks, with the exception of one or two insignificant ones, have proved themselves strong enough so far at any rate to face the difficulty successfully, and it is to be hoped in the interest of all concerned that they will succeed in doing so in future, for the losses sustained in coffee are already heavy enough. The movements of the article are followed with the keenest interest, as the position is extremely critical.

THE MARIAWATTE YIELD FOR 1900.

A REMARKABLE YEAR.

Mr. D. M. Salmond, superintendent of Mariawatte, Gampola, shows in his annual return, that in 1900 the famous old field nearly equalled the wonderful record of exactly ten years earlier—with the second higher rainfall—while for the whole estate of 458 acres the phenomenal figure of 996 lbs. per acre is given :—

MARIAWATTE ESTATE.

	A.	R.	P.

THE TEA DUTY AND MEMORIAL TO THE CHANCELLOR OF THE EXCHEQUER.

The following is the text of the memorial of the Indian and Ceylon Associations which Sir Seymour King, M.P., and Mr. W. E. T. Sharpe, M.P., presented, and to which an unfavourable answer was returned :—

LONDON, 10*th December*, 1900.

To the Right Honourable Sir Michael Hicks-Beach, M. P., Chancellor of the Exchequer.

SIR,—We, the undersigned Associations, representing owners and agents in the United Kingdom of the principal Tea Estates in India and Ceylon, and also merchants interested in the importation and distribution of tea, have the honour to submit to your attention the following considerations with regard to the imposition in the last budget of an additional tax of 2d per lb. duty on tea consumed in the United Kingdom.

The points we desire to submit are chiefly the following :—

(1) That the burden of the extra duty falls to a great extent upon the growers and distributors of the tea, and not altogether

upon the consumers in United Kingdom, whom, presumably, it was intended to tax for the expenses of the South African War.

(2) That this burden falls upon the tea industry at a time when it is in a depressed and critical condition.

(3) That this additional tax has been imposed upon only one of three articles of consumption of a similar class, and that of these three articles, coffee and cocoa are chiefly imported from foreign countries, whereas the tea consumed in this country is mainly grown by British subjects and with British capital.

With reference to the first point above mentioned, we beg to submit that the extra duty imposed upon tea consumed in this country cannot be added to the price paid by the consumer without adversely affecting the general consumption, and this must react upon the price paid to the producer. That tea has only gone into consumption at a lower range of prices is evidenced by the fall in the auction price, *e.g.*—

The price of staple teas, *viz.* :—

INDIA AND CEYLON.

	Peoke.	Pekoe Souchong.
Prior to 1st April, 1900, being	5¾d.	5½d.
And at present date	4¾d.	4¼d.

Although the average price of Indian and Ceylon teas may be at present stated at 7d to 7½d. per lb., some 75 per cent. of both is being sold at from 4½d. to 6d. per lb. in bond, and, therefore, on the bulk of the tea the duty of 6d. per lb. is equal to 100 per cent. on its value. If it be true that this falls upon the consumer, then the very poorest class of the community are the sufferers by this taxation, while the better classes who pay from 1s. 6d. upwards per lb. contribute a wholly inequitable proportion; and, further, if the consumer pays it, with the increased cost, consumption will decrease and the market will fall in consequence, to the loss of the producer. But although part of the tax may fall upon the consumer (if not in money then in quality), the above-quoted comparison in prices bears out the contention that the incidence of at least half is upon the producer.

With regard to point (2) we urge that recent Indian Legislation, with the concurrence of the Home Government, threw a heavy burden on tea producers by raising the exchange value of the rupee to 1s. 4d. The effect of this has been to increase the sterling cost of production by at least 20 per cent., and to render a large number of estates immediately unremunerative.

Further, it must be noted that this action of the Indian Government has had the effect of granting a bounty equal to 30 per cent. to China tea all over the world at the expense of the British industry in India and Ceylon. In China, the price of silver is allowed to exercise its natural effect on the course of exchange. In India, the rupee stands at about 40 per cent. over its intrinsic silver value, with this effect, that, whilst teas from India and Ceylon may be costing the same silver price as those from China, the latter can be sold in sterling for 25 per cent. less, with the same result to producers.

We do not contend that the fiscal policy of this country should be regulated with reference to the interests of any particular industry in India or Ceylon; but we venture to ask consideration of the fact that while sugar, which to a large extent is the product of foreign countries, is exempt from taxation, tea is one of the chief agricultural industries developed by British energy and capital, and it is a matter of the highest importance to India in its present troubles, that this industry, which employs so much native labour should not be subjected to a severe check or crisis. Tea being the staple export of Ceylon, were its cultivation to be seriously crippled grave consequences would undoubtedly result to the revenue of that Colony.

We desire to point out that although we were aware when the tax was imposed that its incidence would fall heavily on the industry, we made no formal protest, as we felt that our loyalty to the Empire demanded that we should in no way embarrass the Government in its scheme of taxation at such a critical time.

The third point is of some importance inasmuch as the new scale of duty gives an increasing undue advantage to coffee and cocoa, which most directly compete with tea at the breakfast table.

It seems to us that an industry carried on by British enterprise and capital within the Empire, should at least be put on equal terms with the produce of foreign competitors.

Though the average price in bond of the three competing articles is approximately the same, *i. e.*, 8d. per lb., the import duty on tea is 6d. per lb., on coffee 1½d per lb., and on raw cocoa only 1d. per lb. The annual consumption in the United Kingdom is roughly—

Tea (from all countries)		240 millions of lbs.	
Coffee		28	,, ,,
Cocoa, raw	32		
Cocoa, ground, etc.	6		
		38	,, ,,
		306	

And on the present scale of taxation, therefore,

Tea pays about		£6,000,000	0 0
Coffee pays about		175,000	0 0
Cocoa (raw) pays about	£133,000 0 0		
Cocoa (ground, etc.) pays about	50,000 0 0		
		183,000	0 0
		£6,358,000	0 0

In conclusion, therefore, we venture to hope—

(1) That you will find it possible to remove the extra 2d. per l War Tax, in the next budget.

(2) That it may be found possible to abolish or at least to redu the difference in the scale of taxation imposed upon tea, coffee, a cocoa.

We have the honour to be, Sir, your most obedient servants.

NOVEMBER COFFEE MOVEMENT IN THE U.

Last month's deliveries were large and above the monthly avera for the present trade year; but, for Europe and the United Stat far behind the same time in 1899. For the first five months of th season the deliveries in the two countries averaged 1,147,912 bag against 1,336,857 bags in 1899, or a movement 944,724 bags less i the five months—a loss of over 14 per cent.

The November deliveries in the United States were 459,004 bag in Europe, 822,634 bags; total, 1,281,638 bags, against 1,576,964 ba for the same time the previous year.

The following statement shows the movement and general po tion of the article :—

	Bags.	Bags.
Stocks, November 1, 1900—		
United States	906,697	
Europe	3,718,319—	4,625,016
Receipts during November—		
United States	548,174	
Europe	1,010,590—	1,558,764
Total supply, December 1		6,183,780
Less stocks, December 1, 1900—		
United States	995,867	
Europe ...	3,906,275—	4,902,142
Deliveries, November —		
United States	459,004	
Europe	822,634—	1,281,638
Deliveries, November, 1899—		
United States	583,113	
Europe	993,851—	1,576,964
Decrease as compared with November, 1899		295,326
Deliveries (United States and Europe) October ...		1,340,059
Do. (do. do.) September ...		981,198
Do. (do. do.) August ...		917,608
Do. (do. do.) July ...		1,219,058
Total for five months, 1900		5,739,561
Do. do. 1899		6,684,285
Decrease as compared with 1899... ...		944,724

The November deliveries in the United States consisted of 393,8 bags of Brazil and 65,121 bags of all other sorts.

The visible supply of the world on December 1 was 7,874,1 bags, against 7,802,016 bags on November 1, 1900 (an increase 72,126 bags), and 7,436,492 bags on December 1, 1899.

The total receipts at Rio and Santos for the first five months the trade year were 6,296,000 bags, against 6,094,000 bags for t same time the previous year, and 4,894,000 in 1898-99.

Last year 68 per cent. of the total crop was received at Rio a

ntos from July 1 to December 1. If the same proportion has ne forward this year, it means total receipts of 9,258,820 bags. e find, however, that the average proportion of the crop sent to o and Santos for the first five months of the past five seasons was per cent. of the total, so that if receipts this season are up to that erage, the total crop will reach 10,500,000 bags. Nowithstand- g the increased deliveries of the past two months, the visible pply continues to grow, and is at present the largest ever orted.

The November sales on the Exchange were 725,750 bags, against 7,250 bags in October. The highest price was 7·75 cents for o. 7, September delivery; the lowest, 5·95 cents for December. he spot price was $7\frac{1}{8}$ @ $8\frac{1}{2}$ cents, against $6\frac{1}{8}$ @ 7 cents at same date st year.—*American Grocer.*

DISTRICT ASSOCIATIONS.

CEYLON PLANTERS' ASSOCIATION.

THE BRITISH TEA DUTY.

A general meeting of the Planters' Association of Ceylon as held in the Memorial Hall, Victoria Commemoration uildings, on the 29th ultimo.

Mr. E. Rosling presided, and there were present: Messrs. H. G. ccles, Chairman, Rangala P. A.; W. H. Biddulph, Matale; Charles ibbon, Wattegama; S. N. Vowler, Dikoya; H. V. Bagot, Neboda; . Stevenson, Kandy; M. Scowen, Panwila; R A. Galton, Chair- an, Maskeliya P. A.; St. Geo. Carey, Kandy; T. C. Huxley, andy; F. S. Vowler, Pundaluoya; F. J. Wright, Chairman, elani Valley P. A.; G. C. Bliss, Pussellawa; J. B. Coles, Kandy; . J. Charlesley, Pussellawa; A. M. Carmichael, Hony. Secretary, ussellawa P. A.; A. Cantlay, and James Westland, Matale; . D. Bosanquet, Chairman, Dimbula P. A.; A. H. Thomas, imbula; James Ryan, Dimbula; Joseph Fraser, Matale; W. D. ibbon, Kandy; W. P. Metcalfe, Pundaluoya; A. C. Smail, ogawantalawa; R. S. Duff Tytler, Chairman, Pussellawa P. A.; on. J. N. Campbell, A. Philip, Secretary, C P. A.

The Secretary read the notice convening the meeting, after which e read the minutes of the previous general meeting which were ken as read.

THE CHAIRMAN'S REMARKS.

The Chairman said that it had become the custom at general eetings of the Association to consider the points of interest which ave occurred since the last general meeting, but owing to the near pproach of the annual meeting he would depart from the rule. he point to be considered at this time was the position of the tea nterprise. Owing to over-production many estates were working a loss. They should, therefore, either continue in their present eadlong course or combine to reduce production. He had no cheme to lay before them, but if any practical scheme was thrown orward by any member, he hoped they would all give it their ery cordial support. He then called Mr. Metcalfe to propose his esolution.

Mr. Metcalfe in rising to propose his resolution said in view of he fact that since the resolution, was drafted a deputation at home ad waited on the Chancellor of the Exchequer, he would, with the ermission of the Chairman and the consent of the seconder, Mr. Westland, slightly alter the wording of the resolution as ollows:—"That this Association would urge on Her Majesty's overnment a reduction at as early a date as compatible with the nancial needs of the Empire in the import duty on tea in Great ritain which is now equal to nearly 100 per cent., *ad valorem*, where- y consumption is checked and the stability of the tea enterprise in his colony is seriously threatened, and that a copy of this resolu- on be forwarded to the Secretary of State for the Colonies." In oving his resolution, Mr. Metcalfe said that in view of the fact hat the duty on tea was raised two-pence per pound last Spring, nd that up to the date of framing his resolution, no protest had een raised by the growers, it seemed to him absolutely necessary hat their Association should take steps to record its disapproval f the increase and to advocate reduction. There seemed to be an mpression amongst some few of their community that they were ut ploughing the sands in bringing forward a resolution such as e had the honour to propose. With that he could not agree. Speaking on the subject of increased duty, the Chancellor of the Exchequer had stated that he had heard of no objection from the growers. It was their mistake in not having objected, but it was not wise for them to perpetuate that error. If his resolution was carried by a full vote, the Chancellor of the Exchequer would have to decide if he would maintain a duty which might crush the tea planting industry of Ceylon. It stood to reason that with the present excessive rate of duty, the consumption of tea should be checked, and that was to be regretted, that owing to the large clearances made before this year's budget took effect, the figures could not be accurately quoted in proof of his contention. If they had studied the returns from the United States of America for 1896 and 1899, it would have shown them that the duty imposed in 1898 had caused a shrinkage in consumption during 1899 of $2\frac{1}{2}$ million pounds. Those figures, he maintained, clearly proved that duty checked consumption. The tea planting enterprise conducted by Britishers had to submit this year to a fall in price of over $\frac{3}{4}$d. per pound for their produce, and even if a further fall of $1\frac{1}{4}$d. took place they should have only arrived at the same retail price as in March last; prior to the increase in duty, the grower would have suffered without any benefit to the consumer. In speaking of the fall in price he had taken the figures for all Ceylon tea sold in London, but the shrinkage was far greater on low-grown teas, probably amounting to $1\frac{1}{2}$d. per pound. It was evident from the miserable prices, that were obtained for all teas that consumption had not expanded, as it might have done if the duty had not been raised. He (the speaker), therefore, maintained that they had every right to apply for a reduction. His resolution stated that the duty was nearly 100 per cent., *ad valorem*. He ventured to submit that they might well characterize the rate of 6d. per pound as prohibitive, and as a tax on their industry which could not be borne. Tea was no longer the luxury of the few, but the daily necessity of the many, and it, therefore, behoved them to be able to supply their millions of consumers without the restriction which such an exorbitant rate of duty placed on their produce. They had so far endured the increased duty without a murmur, as he felt sure, all of them had felt that it was but their contribution as citizens of the great British Empire. Now that they found this charge on their enterprise greater than they could bear, they asked for relief and counted on the Government of the mother-country, not squeezing her dependents out of their means of living. Many of them were too painfully aware that the squeeze had already commenced, and he stated without fear of contradiction that unless consumption was allowed to follow its natural course unhindered by the checks recently imposed, the stability of the tea planting enterprise was seriously threatened. That was the feeling that actuated him to bring forward that resolution; calling them there that day, he felt that delay was dangerous and if they waited for their annual meeting, they might miss the opportunity of making their protest heard in time to take effect before next year's budget was framed. They had heard by wire of the curt reception accorded to the deputation in London by the Chancellor of the Exchequer. They could hardly have expected it to be otherwise in view of the fact that they had not objected to the increased rate at the time of its imposition, but he did not think that that first refusal should discourage them from fresh efforts. The Chancellor had stated that the rate would be reduced some day; it was for them to convince him by the unanimity of their vote that the day must be an early one; that relief from the six-pence rate was necessary because of its unjustly high proportion to the cost of an article in such universal comsumption as British-grown tea. In the same paper they had read of the deputation; they had also seen that the Home Government; had appealed to the employers to retain the situations of Colonial troops. They should certainly listen to that appeal, as he trusted theirs would be listened to and a reduction of the tea duty granted at an early date. He begged to move the resolution as altered.

Mr. James Westland seconded the resolution and in doing so he said that in the last annual report in the book of proceedings of the Association, he found a resolution passed to the effect that the Committee had not been sufficiently convinced of the desirability of the reduction of the tea duty in England to induce them to commence an agitation. In December last a resolution was passed by the Planters' Association to the effect that they deemed it undesirable to take action in the matter. The reduction of the duty would, in his opinion, have led to a considerable increase in consumption of tea in the United Kingdom. Instead of six pounds per head he

did not see any reason why it should have taken as much as Australia. The reduction or abolition of the duty he had always held would have led to a greater demand for their teas among the working classes. The abolition would also have led to a considerable reduction in London warehouse charges which were a heavy burden over their industry The Committee were afraid that by the abolition of the duty the Home market would be flooded with rubbishy teas believed to be stopped at the Customs, and the Committee doubted whether a reduction of the duty would directly benefit the consumer of whether it would not benefit the low-priced teas from China and other competing countries. With reference to the absence of check on rubbishy teas, they had the Food Adulteration Act, and all foods were liable to it, so that teas unfit for food could be seized and destroyed as readily at the Customs although there was no duty. Why should they suppose that tea, free from duty, should not be seized and destroyed, it it had contained rubbish, or was found unfit for consumption under the Food Adulteration Act. Other products and foods were well looked after, whether duty or no duty. It struck him in all probability that the act would be more stringently enforced, if the duty was abolished Rubbishy teas was a very different thing from poor teas. Poor teas would find their way to market so long as there was a demand for them and it paid the grower. All could not grow high-class tea. If it was admitted that the reduction of duty from 6d. to 4d. had increased the consumption, he did not see why a further reduction should not have a similar effect. They knew that since the duty had been increased from 4d. to 6d., they—the growers—had their prices all round reduced almost 1d. per pound, while the increasing consumption was checked. Any action which tended to check the consumption of their teas was a serious matter to their industry and to Ceylon. In December, last year, he had the pleasure of seconding a resolution that suggested action being taken in conjunction with the Indian Tea Association for the abolition of the English Import duty on Tea when the time for such agitation was deemed advisable. He regretted that that resolution had been lost. The patriotic feeling was then too strong in Ceylon to give any consideration to such a subject; the bare consideration of the question was declared by a majority to be inopportune. Some were quite aware of the danger of a probable increase being imposed, but they preferred to sit on the fence and see how the cock jumped A year had shown at least some of them the mistake they made in putting off the consideration of the question. The past year had shown them how the extra 2d. duty of which they had almost to pay one-half (and some thought more) had checked the home increasing consumption. Need he point out the seriousness of the position. There must be thousands of acres of god tea not paying for cost of production. They had only to look at the Wednesday's sale list, and if they were analysed a useful table would be found there. He would not harrow their feelings with any attempt at a description of what may prove to be history of Ceylon during the first year of the new century, if matters went on a few months longer as they had been doing. He hoped they would not have to face another crisis, for many of them remembered the hard struggle they had to make ends meet when coffee began to fail, and many who where unable to fight the dead fight, had to give up the struggle If the great tea industry continued to be handicapped by a tax of nearly 100 per cent. *ad valorem* by the mother country, the whole island of Ceylon would suffer for a time. If they had been overanxious to increase their staple industry, had they not been doing all they could to open up new markets in foreign countries? They were spending largely out of the little profits they had, but which they would have no longer unless a decided improvement took place, either in the reduction of British duty or increased demand from other markets. He would beseech them not to give the Secretary of State or any one else the opportunity of saying that they had not expressed their opinion on the effects of that tax on the main industry of their Colony. They should have spoken out long ago. They might be too late for getting immediate relief they sorely needed, but they should not quietly submit to a tax that they knew was crushing the life of their industry.

Hon. J. N. Campbell said he had great pleasure in supporting the resolution. Their present feelings had been fully described by the mover and seconder Mr. Westland had remarked that their patriotism prevented them carrying on an agitation last year, and he (the speaker) hoped that they were all just as patriotic now. He compared the consumption of tea and coffee between England and America.

Mr. J. Ryan said that he had expected some one to oppose resolution, and as nobody had done so, he rose to speak in favo the same. He was one of those who sat on the fence last y They had contributed their quota in men, money, and in o ways, and made the island a home for involuntary exiles w enhanced the price of coal and iron. Last year they were in a carious position, living on reduced income, and they might soon to live without any income. It had been said that the A ciation was not sufficiently represented by proprietary plan and that superintendents gave their votes, having no pecun interests at stake. That sort of day was over. He would p out that Imperialism was a good thing and the Empire a g and good thing, but it was not proper for Imperialism to be one Colony to make another. He regretted that this motion not passed last year. They were then undoubtedly shortsighte

Mr. W. D. Gibbon said that it was best for them to show local Government the danger of the present day. Two weeks he had received a letter from a large tea proprietor in the South Province, stating that at present the more tea he put into market the more he lost. He had other products in reserve, did not like to care what had hitherto given him a fair reve He also thought that the natives employed by him would suffe they did not receive their wages on his abandoning the estate. asked for his advice. He replied to say that if he could affor that he might give rest to the estate for some months. There another difficulty to face and that was the impoverished Sinha labour employed in the low country in plucking tea. It w also militate against the prosperity of Moratuwa where sawers carpenters came from. In his opinion, Mr Ryan had looked at matter in the proper way as citizens of Ceylon. He hoped that w they said that day would show the Executive of the country danger of the duty on tea. He supported the resolution.

Mr. Charles Gibbon said that the cause of all this was not high duty but over-production. In hearing the arguments of gentlemen who had spoken, one would imagine that it was all to high duty. They were losing sight of the fact that theirs an agricultural Association, rather than a political one. If t had a strong case, they should show that the remedy was in t hands. If duty was reduced to-morrow and prices increased, th would yet be plenty of capital to open out more land and the state would be worse than the first. He was of opinion that t should ask for a *quid pro quo* in the form of a board or schoo Tropical Agriculture, in return for what they gave.

Mr. W. A. Bosanquet said that at a meeting held in Dimbula Friday, they had given their unanimous support to Mr. Metcal resolution, although their district was less affected by the pres position. They did not take a selfish view, but chose to stand the general prosperity of the country. He did not agree w Mr. C. Gibbon in saying that the present position was due to o production. On the contrary, it was due to less consumpt although overproduction has its effect.

Mr. Metcalfe then rose and said he was glad to see there was u nimity amongst them. He had been 26½ years in the island, this was the first time he had the pleasure of addressing them. this matter, he felt that prompt action was necessary, and. theref he did not delay in bringing forward the resolution. He than them all for the support they had given him

The Chairman then put the resolution to the meeting and it carried unanimously.

The Secretary stated he had received 252 proxies in suppor the resolution.

A vote of thanks to the chair terminated the meeting.

WYNAAD.

Proceedings of the Annual General Meeting held Meppadi, Wednesday, 2nd January, 1901. PRESENT Messrs. Atzenwiler, Behr, de Fonblanque, Mackinlay, Malcolm, Nicolls, Taylor, and G. Romilly, *Honorary Secret* Mr. Mackinlay *in the Chair*.

The Honorary Secretary read the following Annual Report :—

Annual Report for 1900.

GENTLEMEN,—In submitting a report to you on the work don this Association during the past year, I will confine myself ch

local matters, and only touch on those of more general interest, so far as the action of this Association with regard to them is ncerned.

Roads.—As usual, the chief efforts of the Association have been rected on trying to prevail on Government to grant sufficient nds to keep open our main road to the coast, and at last, after any years of impatient waiting and constant agitation, they have een crowned with success.

The year opened with a declaration by the President of the istrict Board to the effect that he could not find funds for the pkeep of this road, and that either the Public Works Department ust take it over, or the Ghaut portion would have to be abandoned. t length, by a G. O., dated 5th March, confirmed by one on the h May, the P. W. D. was ordered to take over the road from alicut to the Mysore frontier, and power was to be taken under the adras Local Boards Act to enforce the use of wider tyres for cart-ads over certain weights. The work of reconstruction was com-enced at once and is now being rapidly pushed on.

This is the second time, during a period of fifteen years, that this ad has had to be reconstructed, owing to the short-sighted policy the Madras Government, which, after spending lakhs on its nstruction, refused to find the necessary funds for its upkeep. Ve can only hope that the costly lessons of the past will prevent s again being allowed to go to ruin.

Soon after the work of reconstruction had commenced, a terrible ll of rain, during the night of the 3rd August, caused severe ndslips, breaching the road in many places over a distance of five iles and quite cutting off our communications with the coast. Ve have already recorded our thanks to the Madras Government r the prompt way in which the necessary repairs were taken in and and carried out.

With regard to the taluq roads we have got the Collector to recog-se the principle that tenders under **A**-system should not be ac-pted from persons whose supervision is likely to be nominal, and consequence we may hope for improved maintenance on these roads uring the coming year.

Famine.—In March last we suggested to the U. P. A. S. I. that ey should open a Famine Relief Fund, but the Chairman declined, nd, in consequence, we sent our subscriptions to the Malabar istrict Fund. At first deeming famine to be an impossibility in Malabar itself, we requested that the whole contribution should be aid over to the Central Committee without any deduction whatever r the district; but we soon found that the effects of the famine ad come even nearer home to us. In our own district the prices f grain rose abnormally, and the rise was accentuated by cart-affic being cut off from the coast on the one side by the slips on the haut, and hampered on the Mysore side by the plague camps. or many weeks strong coolies were not able to earn much more an their subsistence allowance, and the weaker ones began to ow signs of distress. In consequence, all future contributions ere devoted to local relief, and we opened small famine hospitals t Meppadi and Vayitri. The thanks of the Association are due to Ir. W. Mackinlay and the late Mr. Arthur Winterbotham for aving organised and superintended these relief kitchens.

Plague.—Luckily the plague has not yet made its appearance in ne district. Although considerable dissatisfaction has been ex-ressed as to the way in which the plague camps were conducted, nd complaints were made as to alleged blackmailing, and, although e expressed great satisfaction at their being closed in July last, yet, hen the severe recrudescence occurred in Mysore in August, we agerly welcomed the return of the camp inspection, justly consi-ering that immunity from plague was cheaply purchased by a w cases of individual inconvenience.

Police.—At the commencement of the year we asked that the uropean constable at Vayitri might be allowed horsekeep, so as enable him to do his duty; but the department, with economical olicy, declined the request.

Money Orders.—There have been numerous complaints in the year out the delay in cashing money orders at Post Offices; but from ne papers that will be put before you to-day, it will be seen that future all cause for complaint should be removed.

And now I will pass on to subjects which are primarily dealt ith by the U. P. A. S. I.

Legislation.—The amendments to the Coffee-stealing Prevention ct have passed into law. The Collector of Malabar has been sent a suggested form for returns demanded by the Act; but, although the harvest is now more than half over, we have not yet heard that the new forms have been circulated among coffee-growers.

The Labour Bill is still *in camera*. In January last we held a special meeting at which the original draft was considered and various amendments to it were suggested: these were forwarded to our then representative on the Council, Mr. Hodgson, and we have his assurance that the amendments have all been accepted by the Member of Council in charge of the Bill. This was in February last; but up to the present moment no copies of the amended Bill have been circulated. The necessity for this secrecy is not apparent.

Foreign Market Funds for Coffee and Tea.—At a meeting held in October all the tea-planters of the Association, with one dissentient, agreed to support the fund constituted, as it was then on the old basis of 4 annas an acre and ½ anna per maund of made tea. Unfortunately the very next month a new scheme for bearing a cess by the London brokers was submitted to us, and the matter is consequently still under consideration. As to the coffee fund we have not shown the same disposition to join. The cases are hardly analogous. The tea industry of India and Ceylon is already enormous and steadily increasing. The object of the foreign fund is to enable it to master and control the markets of the world. As fast as China tea is driven out from any country, quantities of cheap Indian and Ceylon teas are ready to be poured in, and the vacuum is filled. But with Indian coffees, the case is widely different. The production is very small compared with that of other countries. Really good Indian marks are well-known and secure prices equal to, if not better than, those of coffees from other countries, and I fear that no amount of money spent in advertising and in seeking so-called new markets, will enable our commoner kinds to compete on more advantageous terms than at present, with the other cheap coffees of the world.

Statistics.—I regret that, in answer to an appeal for statistics from the Indian Tea Association, so few returns were sent to me, as to make them valueless.

Sir Arthur Havelock.—Two years ago, in our annual report, we stated that we were deeply indebted to Sir Arthur Havelock for his support about the road and for the unremitting interest he had shown in all subjects affecting the welfare of the planting industry. We can endorse that sentiment to-day. A month ago we asked the Chairman of the U. P. A. S. I. to convey the thanks of the community to His Excellency by letter; but, as you will see in to-day's proceedings, this course was not approved. Regret must be felt by all that Sir Arthur Havelock was allowed to leave the Presidency without a public expression on the part of the planters of their thanks for the consideration shown them during his tenure of office.

Memberships and Accounts.—Owing to deaths and departures from the district, the members of the Association have dwindled this year to the record number of 34. Among the deaths we have to deplore that of one of our oldest members in Mr. T. J. Boosey, who was a member of the Association in the sixties, and that of our youngest Mr. Arthur Winterbotham, who only joined us in the month of July last.

The income of the Association is still in excess of its expenditure.

Proposed by Mr. Atzenwiler and seconded by Mr. deFonblanque—carried unanimously—that the Annual Report be adopted.

The Honorary Secretary then laid some of the year's accounts on the table; but stated that the balance-sheet would not be ready till February. Proposed by the Chairman and carried that the following addition be made to the rules:—"That at any meeting of the Association, five members shall form a quorum."

Proposed by Mr. DeFonblanque and seconded by Mr. Nicolls that a cordial vote of thanks be given to Mr. Romilly for his work as Honorary Secretary during the past year. Mr. Romilly was requested to carry on the work in the coming year to which he consented.

Resolved that General Meetings for the coming year be held on the first Wednesday of each month with the exception of April, May and June.

Proceedings of a General Meeting.

The same members being present, and Mr. D. McKenzie.

1. Proceedings of last meeting were taken as read.
2. Mr. S. H. Powell (junior) was elected a member of the Association.

3. **Import Duty on Tea in Ceylon.**—Mr. de Fonblanque, in a short speech, called attention to the import duty of 4 annas per lb. on tea in Ceylon. He pointed out that it was totally opposed to the principles of free trade, and that the circumstances under which it was originally imposed no longer existed. Resolved that the Honorary Secretary address the U. P. A. S. I. and the Madras Chamber of Commerce with a view to taking combined action for the purpose of prevailing on the Ceylon Government to remove the tax.

4. **Roads.**—Read letter from the Honorary Secretary to the President, District Board, with reference to the Meppadi-Kulpatty footpath, to which no answer had been received.

5. **Tea Foreign Fund.**—Read letter from the Honorary Secretary to the Hon'ble Mr. G. L. Acworth on the subject of levying a tea-cess through the London brokers, and his replies. Recorded.

Resolved that this Association prefers to adhere to the former scheme for levying the cess.

Read U. P. A. S. I. circular No. 80. Recorded.

6. **French Tariff.**—*New Markets for Coffee Fund.*—Read U. P. A. S. I. circular No. 77 and No. 79, forwarding a letter from the Chairman.

Resolved that their Association is not prepared to levy a cess, but is willing to support the Paris Exhibition Coffee-shop scheme by donations after hearing what other Associations more largely interested propose doing.

7. **Sir Arthur Havelock.**—Read letter from the Chairman, U. P. A. S. I., saying that he had not conveyed the thanks of the planting community to the Governor by letter as it would be contrary to official etiquette, but that he had thanked him privately before his departure from Ooty. Recorded.

8. **Process Fees** for service of warrants in Mysore. The Honorary Secretary stated that he had as yet received no answer to his letter to the District Magistrate, Malabar, dated November 21st: he was instructed to write again.

9. **Post Office and Money Orders.**—Read letters from the Postmaster-General, the Superintendent of Post Offices, Calicut, and the Deputy Tahsildar, Vayitri. Resolved that, in the opinion of the Association, arrangements should be made that money orders can be cashed on any day at the Meppadi Post Office; but that, with regard to Kulputty and Sultan's Battery, the Honorary Secretary do communicate with those interested in order to arrange for the cashing of orders on one special day of the week.

10. **Differential Duties.**—Read the U. P. A. S. I. circular on differential duties and answers from the Upper India Chamber of Commerce, Madras Chamber of Commerce, and Indian Tea Association. Recorded.

11. **London Docks.**—Read U. P. A. S. I. circular No. 78. Recorded.

12. **Taluq Board.**—Read letter from the President, Taluq Board, recording Mr. R. K. Walker's resignation. Mr. M. D. Taylor consented to serve on the board in his place.

13. The following papers were laid on the table:—

Indian Tea Association circulars.
Proceedings of the Shevaroy Planters' Association.
Do. do. S. Mysore do. do.
Do. do. Nelliampathy do. do.

A vote of thanks to the Chair terminated the proceedings.

(Signed) W. MACKINLAY,
Chairman.
(„) G. ROMILLY,
Honorary Secretary.

SHEVAROY.

Proceedings of the Monthly Committee Meeting of the Shevaroy Planters' Association held in the Victoria Rooms, on Monday, the 7th January, 1901, at 1 p.m. PRESENT:—Messrs. Thurston Short, C. Rahm, W. J. Lechler, E. Dickins, and R. Gompertz, *Honorary Secretary.*

1. The notice calling the meeting was taken as read.

2. Read letter from Secretary, U. P. A. S. I., enquiring whether this Association thinks it should apply for the gold medal it has won, seeing that the winners of medals have to defray the cost of them.

Resolved that, having won the medal, we think it should be applied for.

3. Read letter from Chairman, U. P. A. S. I. (Secretary's circular, No. 79/00), regarding London Docks and New Markets for coffee. Also enclosing copy of a letter from the Foreign Office stating th... has every reason to believe that the French Government ha... present intention of increasing import duties on tea, coffee, etc...

Recorded with satisfaction.

4. Read Secretary's circular, No. 81/00, reporting action ta... by the Upper India Chamber of Commerce, *re* proposed commer... combination of Great Britain and her Colonies.

Recorded with satisfaction.

5. Read letter from Traffic Manager, Madras Railway, enqui... whether Honorary Secretary could recommend a reliable man, ... would furnish cash security, to convey parcels from Suramanga... to planters on the Hills, at the rates the planters are prepare... pay. Honorary Secretary said he hoped shortly to be able... submit the name of such a man for the Traffic Manager's appro...

6. Read letter from Mr. G. Turner complaining that the Treas... was not open on the 28th ultimo, though the Tahsildar had iss... a notice saying that it would be. As Mr. Turner has not rep... to the Honorary Secretary's letter asking for certain neces... particulars, the letter was recorded.

The following papers were read and recorded:—

Circulars received from the Secretary, U. P. A. S. I.

83/U. Forwarding letter from Mr. Sanderson reporting th... Royal Commission has been appointed to report on the Lon... Docks.

84/U. Central Travancore wants to know if Tea Associations... in favour of compulsory cess.

86/U. Chairman forwards letter from Foreign Office which... every reason to believe that the French have no present intent... of increasing import duties.

87/U. Action taken by Upper India Chamber of Commerce... proposed commercial combination of Great Britain and her colon...

Letter from Traffic Manager, Madras Railway, requesting to... informed if a reliable man can be recommended as a contra... for having parcels conveyed from Salem station to the Sheva... Hills.

Letter from Dr. Watt requesting to know the best season for... visit with reference to fungoid and insect pests.

The following papers were laid on the table:—

Planting Opinion, dated December 1st, 8th, 15th, and 22nd 1... and 5th January, 1901.

Brazilian Review, dated October 9th and 30th, November ... 13th, and 20th.

Salem District Gazette (sale of Waste land).

Proceedings of the South Mysore, Nelliampathy, Coorg ... Wynaad Planters' Associations.

Report on the operations of the Department of Land Records ... Agriculture, Madras Presidency.

Proceedings of the Indian Tea Association, dated December 1... 12th, and 4th.

Agricultural Ledger, No. 18, Rhea (Riha) or China-grass.

YERCAUD, *8th January*, 1901. (Signed) R. GOMPERTZ, *Honorary Secretary, S. P...*

MARKET REPORT.

[*Per Mail advices of* 21*st December* 1900.]

COFFEE.

The London Commercial Record says:—The public sales dur... the week have presented little feature of interest, and privat... there is scarcely any demand. The flatness which has so long p... vailed has become accentuated by the approach of the Xmas h... days; the small auctions yesterday were the last of the year, pu... business being suspended till Tuesday 8th January, 1901. Ny... land sold without change. Dumont Santos was pressed on buy... at a decline of 2s per cwt. The market for "futures" has b... depressed and a serious decline in price has occurred, the ca... being the continued very heavy Brazil receipts and increased e... estimates. Santos March delivery sold down to 30s 3d, May... 30s 6d, July to 31s 6d, and September to 31s; then there wa... rally and March rose yesterday to 31s 3d, May to 31s 9d. ... September to 32s 3d. December 19...	5·45	5·45	5·50	5·60	5·65

TEA.

Indian.—Auctions were lighter, comprising 42,500 packages against 55,200 packages in the previous week, and 41,300 packages a year ago.

There was a fair enquiry for nearly all descriptions. Common at the opening did not shew further depression, but a flatter feeling was apparent afterwards for both leafy and broken sorts at and under 5½d per lb. Useful to good were taken freely at late rates where quality was maintained. Bidding was brisk for fine and finest kinds.

For 38,800 packages on Estate Account 6¾d per lb. was realised, contrasted with 8⅛d per lb. for 35,300 packages and 8d per lb. for 11,900 packages in the two preceding seasons.

Totals printed on Importers' Account during December were:—

1900.	1899.	1898.
142 300 pkgs.	124,300 pkgs.	108,700 pkgs.

making 876,000 packages of the present crop disposed of to date, *versus* 902,000 packages in the same period of 1899, and 878,000 packages in 1898

Ceylon.—At the closing sale of the century held on the 18th instant, 29,100 packages were submitted, opposed to 21,800 packages on the foregoing Tuesday and 12,200 packages twelve months since.

A dull tone prevailed for Pekoes and Pekoe Suchongs under 5¼d per lb. which were easier, the latter selling down to 4½d per lb. or, say, 2d per lb. under the quotation of this time last year. Pekoes and Orange Pekoes over 6½d per lb. did not shew much alteration, though occasionally going in buyers' favour. Low Broken Pekoes were difficult to move, except at a reduction, but those possessing strength and flavour were usually in request. Choice lines continued scarce, many of the parcels now coming to hand from well-known gardens being deficient in tip and cup, as against prior arrivals.

The average is 7⅛d per lb. On the 13th instant, it was 7⅜d per lb., and 7¾d per lb. in 1899.

Catalogued in December:—

1900	1899.	1898.
73,500 pkgs.	56,200 pkgs.	51,500 pkgs.
(Avge. 7⅜d per lb.)	(Avge. 7¾d per lb.)	(Avge. 8⅛d per lb.)

From 1st January to 21st instant, 1,263,200 packages yielded; 7¾d per lb., compared with 8d per lb. for 1,138,100 packages and 7⅞d per lb. for 1,108,800 packages in the two former years.

Java.—Nearly 1,3000 packages of direct import passed the hammer. Demand was limited and many of the less desirable lots were withdrawn.

Totals for the month were:—

1900.	1899.	1898.
2,800 pkgs.	2,000 pkgs.	3,300 pkgs.
(Avge. 6¼d per lb.)	(Avge. 6⅞d per lb.)	(Avge. 6⅞d per lb.)

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns are, *viz.*:—

From 1st to 18th December,	1900	11,962,920 lbs.
Do.	do.	1899	11,346,355 „

During the week the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	34,762	7,777	42,539
Ceylon	25,643	3,481	29,124
Java ...	883	401	1,284
Total ...	61,288	11,659	72,947

Also 386 packages from second hands.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon and Java Tea Report, dated December 21st, 1900, says:—

Quantity brought to Auction in London from 1st June to date.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1900-1901	906,367	717,528	29,590
1899-1900	964,640	684,287	32,695

43,494 *pkgs.* Indian
30,476 „ Ceylon
1,284 „ Java
} Total 75,254 packages were offered in public auction this week.

Indian.—This week's sales closed the business of the year so far as public auctions are concerned, the first Indian sale after Chirstmas not taking place till the 2nd prox. Attractive Teas sold with good competition, but common showed slightly easier prices. The official wire from Calcutta gives the exports to U. K for first half of December as 12,010,000 lbs. against 11,200,000 lbs. same period last year, making the total from 1st April to date 137,430,000 lbs. against 129,792,000 lbs.

In a circular recently issued by the Indian Tea Association, the Calcutta Committee strongly emphasize the necessity for funds to open up new markets. Referring to the levy being raised in Calcutta for that purpose, they close their remarks the following paragraph:—

"The Committee therefore trust that all Companies and Proprietors who have not yet undertaken to contribute will see their way to do so before the 31st December, after which date it is proposed to publish a complete list of subscribers."

Week's average of Tea sold on Garden Account 1900, 38,592 pkgs., av. 6·70d. 1899, 35,863 pkgs., av 8·02d.

Total Tea sold on Garden Account 1st June to date 1900, 736,052 pkgs., av. 7·60d. 1899, 727,886 pkgs., av. 8·49d.

CEYLON.—The closing auction of the year was a rather heavy one, and as the quality of many Teas was not quite up to recent arrivals, quotations were here and there slightly lower. Bidding was pretty general for all medium and good liquoring Teas, but for common descriptions, prices fell away, quotations marking a drop in some instances of ¼d. per lb. The next sale will be held on the 1st prox. Private advice states the quantity shipped from Ceylon to U. K. for first half of Dec. as 5,500,000 lbs. against 6,500,000 lbs. last year, and estimates the quantity for the month as 11,000,000 lbs. Average for week 7·14d., against 7·82d. in 1899.

Ceylon Tea sold on Garden Account 1st Jan. to date 1900, 1,194,536 pkgs., av. 7·20d. 1899, 1,055,154 pkgs., av. 7·96d.

JAVA.—Javas sold somewhat slowly at easier prices, the lower grades especially being weaker.

Bank Rate 4 per cent. Exchange on London three months sight:—Calcutta 1/4 11/32. Colombo 1 4⅜.

COCOA.

At public sale on Tuesday the small supply of 1,732 bags met a flat market, and only about 450 bags sold, at a further decline of 1s per cwt. Of 382 bags Trinidad 160 bags sold at 69s to 70s for good to fine, or a reduction of 1s. 58 bags Grenada sold at a similar fall, at 68s for good fair, and 58 bags Dominica were placed also at 1s below valuations—67s to 68s 6d for fair to good, and 65s to 66s for common. 12 bags St. Vincent brought 66s to 72s. 6 bags common bold grayish Colombian realised 65s 6d. 26 bags Esmeraldas partly sold at 60s for sea-damaged bulked. 316 bags Bahia, 461 bags Guayaquil, and 20 bags Cuba passed the hammer unsold. 27 bags fair to good African were placed at 65s 6d to 67s 7 bags Seychelles brought 67s to 69s. Fine qualities of Ceylon were very firm, but other grades were flat; 351 bags catalogued and 130 bags sold—fine bold and medium red 95s to 100s, middling 76s, smalls 68s to 69s, broken at 64s 6d per cwt. Privately about 1,000 bags Trinidad have changed hands at 70s to 71s 6d for good to fine red, 250 bags Grenada at 70s for good red, and some fine Arriba Guayaquil at 82s 6d per cwt.

PEPPER.

BLACK is dearer, with sales of 100 tons Singapore for arrival, including March-May shipment at 6 11/32d to 6⅜d, closing buyers at the higher price. On the spot sales of fair Singapore at 6⅛d.

Nothing offered at auction.

The shipments of Black Pepper for the first half of December compare as follows:—

	1900.		1899.	
U. K.—Singapore	*nil*		*nil*	
,, Penang	*nil*	*nil*	330	330

GINGER.

COCHIN.—A firm tone prevails, and private business has again been active, about 1,500 bags selling at 32s to 33s for good washed medium and small rough and 32s for Calicut rough sorts, which prices show a further advance. At auction 38 cases 215 bags were catalogued and 170 bags sold, mostly "without reserve" at 30s for medium and small bright Calicut rough wormy, 29s for small to bold dullish washed slightly limed, and 26s to 27s per cwt. for sea-damaged Calicut rough.

INDIA RUBBER.

The market for fine Para has continued firmer and a fair busi has been done; sales of Hard fine old import on the spot at 3s to 4s ditto forward delivery 3s 10½d to 3s 1 ¾d; Soft fine spo 9¼d to 3s 9½d, forward at 3s 10d; Negroheads, small sales of scra at 2s 10d, Cameta 2s 3½d to 2s 3¾d. Peruvian.—Considerable s of ball at 2s ½d to 2s 7½d according to quality and condition. medium kinds there is more enquiry at the low prices, with s privately of Mozambique Lamu ball at 2s 4½d, and softish w ball at 2s 2½d to 2s 3d per lb.

At auctions to-day small supplies were brought forward, wh met a fair demand at slightly better prices.

Para.—28 cases retired.

Peruvian.—42 packages offered and 12 sold, fair scrappy 2s fair ball at 2s 8d.

Mollendo.—28 cases sold. Fine 3s 8½d to 3s 8¾d, entrefine 3s scrappy negroheads 2s 8¾d.

Central American, &c.—28 bales sold, good clean scrap 2s tarry scrap, fair 2s 5¼d to 2s 6¾d, clean pressed strips 2s 1¼d, sheet 2s per lb.

Mangabeira.—12 cases offered and 2 sold, pinky sheet, rat dirty 1s 8d.

New Guinea.—3 bags sold, brown ball, good 2s 9½d, ditto rat dirty and mixed 2s 5d.

Madagascar, 11 packages; Mozambique, 77 bags; and Assam packages, retired.

PRICES CURRENT.—Per lb.	Present Prices.				1899.

CINCHONA.

At the London auctions, on Tuesday, the small supply of 1, packages were offered by the nine brokers, of which the grea proportion sold at an average unit of 1⅜d to 1 7/16d, as against 2d the previous London auctions, and slightly below the parity of last Amsterdam sale. The next sale in London will be on January

The following table shows the amount of bark offered and sold

	Packages offered.	Package sold.
East Indian cinchona	681	556
South American (Calisaya quill) ...	389	335
Java cinchona	277	277
Ceylon cinchona	137	54
	1,484	1,222

The following were the approximate quantities of bark purcha by the principal buyers:—

	Lbs.
Brunswick factory	87,406
Mannheim and Amsterdam factories	44,710
Messrs. Howards & Sons	37,900
Frankfort & Stuttgart factories	24,810
Imperial Quinine factory	22,985
American factory	2,250
Druggists, etc.	32,620
Total quantity sold	252,681
Bought in or withdrawn	60,323
Total quantity offered	313,004

The prices paid for sound bark were as follows:—

SOUTH AMERICAN.—Bolivian cultivated Calisaya quill, ordin to fair, 6¾d to 8¼d per lb.

CEYLON.—Ledgeriana, original stem chips, 4¼d; hybrid di 3¼d to 3¾d.

AVA.—Ledgeriana, original stem chips and shavings, 3½d to 5⅜d: nch, 4¾d to 4⅞d; root, 5⅜d to 6⅜. Red, original stem, 2¼d to 5⅛d, root, 2¼d per lb.

AST INDIAN.—Red, natural stem chips and shavings, 2½d to 5⅜d; ewed, 7⅛d. Ledgeriana, original branch, 3⅜d; officinalis original n, 3¼d to 7⅛d; renewed, 5⅞d to 7⅝d; branch, 5¼d; and root, 5d 5d.

he exports from Java for the first half of December were 470,000 sterdam lbs., against 270,000 Amsterdam lbs. last year.

QUININE.

There is no further improvement to be noted in the second-hand market this week the tone being dull and the tendency still easy, although there are few sellers. On the spot B. & S. or Brunswick brands have sold at from 1s 1d up to 1s 1¾d per oz, March delivery at 1s 1¼d to 1s 1¾d, and May at 1s 2d. The market closed on Wednesday with buyers of March delivery at 1s 1¾d, and sellers at 1s 2d. To-day the market has been quiet with sellers at 1s 1¾d per oz spot, and small sales have been made at that figure.

Duty payments and exports during the first eleven months of the last three years are given below:—

"THE PLANTER."

New and Enlarged Series.

This is a Weekly Journal conducted with a special view t interests of Planters. It contains Leading Articles by Experts: After upon Topics of General Interest to Estate Managers and Assistants:

Editorial Echoes,
District Correspondence,
Companies' Reports,
London Tea Letter,
Indigo and Coffee Notes,
Letters to the Editor,
Market Reports,
Scraps from Home,
Tea Sales,
Ladies Column,

and rates showing the Position and Returns of Calcutta and Londo Companies.

"THE PLANTER"

is an excellent medium for Mofussil Advertisements: its circulat among a special class of buyers.

"The Planter," 9, Hare Street, Calcutta.

PLANTING OPINION.

A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VI.] MADRAS, SATURDAY, JANUARY 19, 1901. [No. 3.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 25th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

Munzerabad. *January 15th*, 1901.—*Crop*—is ripening-up very slowly; excellent crops are being gathered on most places, and estimates are already generally passed. *Weather.*—A heavy shower of rain fell on Thursday last, and a smaller one on Friday. This has done damage in forcing on a blossom, when the tree should be wintering, and in knocking crop off. The rain will, however, be beneficial in ripening-up the backward berries. *Health*—Generally good throughout the district.

Coorg. POLLI BETTA, 16*th January*.—*Weather.*—Mostly cloudy. Rain last Friday about ·35 inch. *Crop.*—Ripening satisfactorily, and contract picking still going on. *Labour*—Sufficient. *Health*—bad.

COFFEE IN MYSORE.

OFFICIAL statistics should rarely be accepted as absolutely accurate. Especially is this the case when they relate to agriculture, for it is notoriously difficult for any person, official or non-official, to obtain reliable figures from cultivators of the soil. Planters, for instance, usually manifest a decided objection to what they frequently regard as inquisitorial investigations into their financial position; and it has become customary now-a-days to attach to agricultural statistics a warning that they must not be implicitly relied upon. Nevertheless, there is much interest and some little instruction to be derived from the Agricultural Statistics of Mysore for the years 1894-95 to 1898-99. Granted that the figures are probably not strictly accurate, there is no reason to suppose that those relating to one year are more erroneous than those referring to another. Hence we may assume that a fair comparison, or something very near to it, may be drawn between the various annual figures before us; and certain general conclusions may be drawn without much hesitation as to their approximate accuracy. For instance, the statistics show us that Kadur and Hassan are the districts in which coffee plantations are mostly found in Mysore. In 1895, Hassan took the lead with a total of 16,600; in 1897, it fell behind Hassan; and by 1899, the figures stood as follows:—Kadur, 10,222 plantations; Hassan, only 8,963. In other words, nearly 50 per cent. of the plantations open in Hassan in 1895 had closed by 1899, while the number in Kadur had only shrunk from 12,280 to 10,222, a decrease of less than 20 per cent. Then, again, in the matter of permanently employed labourers, Kadur held the lead throughout the quinquennium, while in regard to the average daily number temporarily employed, Hassan was mostly ahead of its rival. The figures stand thus:—

	Permanent.		Average daily.	
	H.	K.	H.	K.
1895	4,615	4,946	25,021	21,247
1896	4,491	5,630	17,916	30,427
1897	3,667	5,409	54,821	21,907
1898	3,570	6,466	48,936	19,694
1899	2,956	5,425	45,522	18,735

Thus the decrease in the number of estates in Hassan is not fully reflected by the decrease in permanently employed labourers, while there has been a large increase in the average daily number temporarily employed. On the other hand, the smaller decrease in the number of plantations in Kadur has been accompanied by an increase of, say, 10 per cent. in the number of permanent hands, and a decrease of rather more in the average number of temporary hands.

Still more interesting are the acreage returns, as will be seen from the following figures:—

	Mature Plants.		Immature.		Total.	
	H.	K.	H.	K.	H.	K.
1895 ...	53,159	55,510	4,048	25,685	57,207	81,195
1896 ...	54,410	58,210	3,545	24,399	57,955	52,609
1897 ...	35,366	57,873	7,150	24,201	42,516	82,074
1898 ...	35,282	58,655	7,279	25,597	42,561	84,252
1899 ...	35,242	59,434	7,280	24,793	42,522	84,227

These figures suggest several deductions. In Hassan the decrease in acreage under mature plants was much greater than the reduction in the number of plantations; in Kadur

there was a small increase in acreage. The fluctuations on the Hassan figures are so violent as to raise grave doubts as to their reliability, yet there are as great oscillations in the "yield" returns for both districts, which are as follows :—

	Yield in lbs.	
	H.	K.
1895	4,974,652	11,812,500
1896	3,492,192	5,595,113
1897	1,483,062	3,133,867
1898	1,816,381	5,680,654
1899	1,595,157	5,237,396

Reckoning entirely on the acreage under mature plants, yield per acre fluctuated (approximately) as follows :—

	Yield per acre in lbs.	
	H.	K.
1895	94	214
1896	64	95
1897	42	54
1898	52	97
1899	45	87

There are certainly indications of serious blunders here. Perhaps some of the older planters in South and North Mysore can throw light upon the facts, which appear to show that the yield per acre in 1899 was less than half that of 1895!

It should be added that figures of total cultivation of coffee in Mysore show the same results (always allowing for "rough" calculations in round figures) and for the fact that area under immature plants is included in the following table :—

	Acres under Coffee.	Yield in lbs.
1895	138,670	16,796,016
1896	141,528	9,112,757
1897	125,876	4,659,376
1898	128,079	7,552,965
1899	128,000	6,868,733

This implies a yield per acre (under both mature and immature plants) of—

	lbs.
1895	121
1896	64
1897	37
1898	59
1899	53

To put things mildly, these figures are amazing.

U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

The Indian Tea Association (Calcutta) has issued the subjoined memo. by Mr. H. H. Mann, B.Sc., F.I.C., for the information of members :—

A SUGGESTED REMEDY FOR THREAD BLIGHT ON TEA.

One of the most widely diffused and insidious blights which attack the tea plant is that fungus generally known as 'Thread Blight' (*stilbum nanum*). It occurs more or less in practically every district where tea is cultivated in India, and on many gardens it has been responsible for a very large amount of damage. The blight itself is so common, widespread, and well-known that I will not attempt to re-describe it. Starting from a point or points near the jungle, as a rule, it spreads from bush to bush, gradually killing branch after branch of any plant it may attack, and rendering useless, if it does not actually kill, the bush on which it occurs. Its depredations are generally most obvious at the end of the flushing season (although, if looked for, it can be seen at most seasons of the year), and at this time I have seen sections of gardens in which fifty per cent. of the bushes have been affected.

The remedial measures which have hitherto been adopted have usually consisted either in cutting out the thread so far as it can be seen—a method which is recognised as never having been more than a very unsatisfactory palliative,—or in burning the [illegible] before pruning, and then cutting it down to the ground. Reme[illegible] such as the latter of these, though they are generally succes[illegible] are certainly to be avoided if possible, since they necessitate [illegible] collar-pruning of individual bushes in a plot, which generally re[illegible] in serious damage to the bushes in question during the follow[illegible] plucking season, and also since if the treatment does not succ[illegible] the bushes are left in a worse condition than that in which [illegible] are found.

A method has, however, been adopted during the past tw[illegible] three years in Upper Assam which has apparently been very [illegible] cessful in practically eradicating the blight wherever it has [illegible] efficiently applied.

The method is briefly as follows:—7½ lbs. of lime quick [illegible] unslaked—are slaked with water, and then mixed with 2½ lb[illegible] sulphur—water being then added to make the volume of the li[illegible] up to ten gallons. The mixture is boiled in an iron vessel till [illegible] liquid becomes orange in colour and takes on an abominable s[illegible] (somewhat similar to that of rotten eggs), allowed to cool, [illegible] applied carefully and thoroughly with a brush or piece of jute to [illegible] all the stems of the tea bush which show any sign of thread bli[illegible]

It is, of course, almost unnecessary to state that the prun[illegible] should always be burnt wherever thread blight occurs. Other[illegible] the blighted prunings may set up a still more serious attack [illegible] following year.

From what I have seen I think that this method, whic[illegible] comparatively inexpensive, will be found of extreme use in com[illegible] ing this, which is, as I said before, one of the most serious bli[illegible] of the tea plant at the present time.

* * *

THE RIVAL CLAIMS OF TEA CHESTS.

The following is the text of a letter addressed by the T[illegible] buyers' Association, London, to the Indian Tea Associati[illegible] London, relating to Patent Tea Boxes :—

I am instructed by my Committee to call the attention of [illegible] Committee to the very undesirable packages in which Indian [illegible] Ceylon teas are being packed.

They believe that arrangements are now being, or are about to [illegible] made by the gardens for next season's crop, and they feel that [illegible] is the time to put on record their opinion as to the most desir[illegible] package.

No doubt merchants are entitled to pack their teas in any kin[illegible] package they like, but nevertheless, my Committee think t[illegible] buyers are entitled to say what in their opinion is the most suita[illegible]

At present there are several kinds of package in use, *viz.*, woo[illegible] chests with leaden linings, Venesta chests, Colinda chests, Es[illegible] Colinda chests, and Acme metal, and Acme Veneer chests. Th[illegible] may be others. Of these mentioned, my Committee are of opin[illegible] that the old wooden chest, with a good lead lining, is the b[illegible] None of the others are free from serious objection. Metal che[illegible] they consider, are the most unsatisfactory. It is a well-known f[illegible] that metal is a good conductor of heat and cold, and tea packe[illegible] metal chests is subject to every change of temperature. Ther[illegible] a certain condensation on the metal at times which tends to g[illegible] the tea a weathery flavour.

The tops and bottoms of these metal chests are very ea[illegible] knocked out and, very frequently, buyers find several pounds of [illegible] wasted in their vans. Neither are they good for repacking, [illegible] they cannot be cut down, or made smaller.

The Acme Veneer chest has, my Committee believe, been c[illegible] demned, and will not be used after this season, but they underst[illegible] those who are using it at present propose using the Acme m[illegible] chest instead.

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nic[illegible] son's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf pe[illegible] unable to procure the Ear Drums, may have them free.

Address—No. 989 D, THE NICHOLSON INSTITUTE, [illegible]
Longcott, Gunnersbur[illegible]

[w. 26-5-00—26-5-1901.] *Lon[illegible]*

The Venesta, Colinda, and Esma Colinda are very much alike, eing made of three-ply wood and having a thin lead lining. They re much too weak, and are easily broken and punctured. If they ere made of stouter material and stiffened at the corners with attens inside, they would be much better. The leads used are requently so thin, as to be of no protection, and my Committee are onfident that the interests of the importers are considerably amaged by the use of such.

The reason why merchants are using these patent packages is, my ommittee believe, because of the difficulty of getting wood; but ney are assured that an unlimited supply can be obtained from weden, and it would cost no more than the patent packages.

I, therefore, desire to reiterate that the most satisfactory ackage is the old wooden chest with sufficiently thick lead lining, nd some members of this Association have informed the Committee that they will not buy tea packed in any patent package, if ney can possibly avoid it.

COFFEE IN DISTANT LANDS.

XXII.

Abyssinia:—A Consular report from Harrar, says: "The Harrari coffee is of a very good quality, known in the London market as 'Moka long berry,' where it is preferred to the real Moka. Occasionally its price in London is higher than that of Moka. Plantations of coffee are increasing slowly, because the natives prefer to cultivate the Kiatt (Celastrus edulis) as more lucrative, 1 lb. of leaves of which are sold for 1 dol., and sometimes 2 dol.; the natives, as in Arabia, are eating these leaves. Nevertheless, more than 150,000 coffee trees have recently been planted, especially in the districts of Chercher and Itto." The Abyssinian coffee is wild and grows in Kaffa (whence the name), Limmu, Gimma, Gumma, Ghera, Ennarea, Hillu. It has a very good aroma, and if cultivated it would be a very keen competitor of the real Moka. Monseigneur Massaya (afterwards Cardinal), when Bishop of the Gallas some forty-five years ago, cultivated in Ennarea 3,000 trees and obtained a quality much superior to the real Moka both in flavour and aroma. This coffee used to be imported here from the above countries *viâ* Adis Abbaba, and exported to Europe after being cleaned in Aden. In the European market it is known as Abyssinian coffee, but on account of the present low price of American coffee the export of this coffee is decreasing. Most of the import is stocked in Harrar, and now the imports from the interior are next to nothing, the price, 4 dols. per farasla, not covering the expenses of transport from the above-named countries. Should the American crop fail, the increase of export of Abyssinian coffee would recommence. On representations made by the merchants of Harrar, the Emperor Menelek has abolished the export duty of 8 per cent. on Abyssinian coffee this year.

Fiji.—Coffee grows well in Fiji, both the Liberian and Arabian varieties, and does best in shaded mountainous districts, such as are found in the upper reaches of the Wai-ni-Buka in Viti Levu; large areas have been put in by the Fijians as an addition in future years for the payment of their taxes and self-betterment.

Guatemala.—The United States Consul at Guatemala writes:—"The delay in shipping coffee from this Republic is caused by the poor condition of the roads, owing to the heavy rains, which prevents transportation to the ports. While this reason is the one generally advanced, I am of the opinion that the "finqueros" are holding back with the hope that the duty of 6 pesos ($2.70, at present rate of exchange) a quintal (100 lbs.) will be remitted. Coffee shippers in Guatemala are exceedingly worked up on account of this new export duty, saying that the exchange has dropped about 200 points, and therefore the 6 pesos means a greater gold outlay by 33⅓ per cent. than they would have had to pay when the decree fixing the duty was promulgated; besides this, the coffee quotations abroad are considerably lower than was expected. As the largest coffee fincas are owned and worked by Germans, the hardship will affect them most. There seems to be little hope of a revocation of the decree fixing the export duty above mentioned."

Mexico.—The Mexican Coffee Crop in 1899 amounted to 18,375,035 pounds, valued at $3,436,039 (Mexican).

New South Wales.—According to the *Agricultural Gazette* of New South Wales, Mr. John Ball, of Chatsworth Island, reports that his coffee crop in 1900 was a great success. His last crop returned 1,694 pounds, which sold at 1s. to 1s. 3d. per pound. This year the crop is expected to amount to something like 6,000 lbs. Mr. Ball has mastered the manufacture of coffee of the highest quality, and finds a good demand for it. His trouble is to secure sufficient quantities of beans. In reply to inquiries made of Mr. Holmes, a planter in Fiji, Mr. Ball has been informed that, owing to unsatisfactory price offering in Sydney for the Fijian bean, the growers there were abandoning coffee-growing. Mr. Holmes forwarded Mr. Ball some seeds of the Liberia coffee, which is a sturdy-growing tree with deep tap root, and which bears a larger berry than the ordinary Arabian variety. In Fiji, even at the extremely low prices (3d. to 5d. per pound) paid for the beans, this variety returned 4s. 7d. per tree. Mr. Ball finds that he can pay 10d. a pound for good beans. His harvesting is done by lads who are able to earn 15s. a week at the work.

NOTES

Tea Sales in London, 1901.

Every Monday, Tuesday, Wednesday, and Thursday.

Cocoa Sales in London, 1901.

Every Tuesday. First sale of the year, 8th January—11 o'clock.

Coffee Sales in London, 1901.

Every Tuesday, Wednesday, Thursday, and Friday. First sale of the year, 8th January—10 o'clock.

China Tea.

In a few districts in China cultivators are said to be abandoning tea, and substituting sweet potatoes, bananas, and other food-stuffs.

Coffee in the United States.

The *American Grocer* of 5th ultimo says:—The market for mild coffee is dull and nominal. Good Cucuta is quoted at 9¾ cents. The weakness in Brazil coffee has checked demand for all sorts.

The Use of Insecticides.

"Why, Pat, for heaven's sake, what's the matter?" "Well, sorr, I swallied a pertater bug, and, although, sorr, I took some Parrus green widin five minutes after to kill th' baste, shtill he's just raisin' th' divil inside o' me, sorr."

Cinchona Liqueur. A liqueur of cinchona is said to be largely consumed as a liqueur at the refreshment bar connected with the French Chamber of Deputies. A *pharmacien* supplies restoratives and medical stimulants which can be had without a doctor's prescription.

Vanilla Sales in London, 1901. At 12 o'clock.

9th January.	1st May.	18th September.
6th February.	29th May.	16th October.
6th March.	26th June.	13th November.
3rd April.	24th July.	11th December.
	21st August.	

Cinchona Bark Sales in 1901.

London.

15th January.	21st May.	24th September.
12th February.	25th June.	22nd October.
12th March.	23rd July.	19th November.
16th April.	20th August.	17th December.

Holland.

10th January.	9th May.	3rd October.
21st February.	13th June.	7th November.
28th March.	18th July.	12th December.
	29th August.	

Tea Exports from India. The Exports of tea from India from 1st April up to 7th January, 1901, to the United Kingdom total 146 millions lb., and to all other countries 21 millions lb. The comparison with the previous years is as follows :—

1st April to 7th Jan.	To U.K.	To all other Countries.	Total.
1900 ...	123,536,750	14,981,878	138,518,628
1899 ...	138,951,100	19,272,150	158,223,250
1898 ...	146,000,000	21,000,000	167,000,000

Over-production on the increase !

The London Tea Market. Messrs. Gow, Wilson & Stanton's telegram of 10th instant to Colombo reports that the market generally shows a slight decline and that the market for medium liquoring pekoes and broken pekoes is steady, while the market for teas for price is easier. The price of fair liquoring Ceylon Pekoe Souchong is 5d. (a farthing down) and the average price of Ceylon tea sold on garden account this week was 6½d. (five-eighths of a penny down)—as against 6¾d. and 8d. respectively in the corresponding week last year. *Reuter* reports that 29,000 packages of Ceylon tea were offered for sale, of which 27,000 were disposed of ; while of the 52,000 packages of Indian tea offered, 44,000 found purchasers.

Las Cascadas Plantations Company, Ltd. This company has been registered, with a capital of £100,000 in £1 shares (35,000 preference), to acquire the business of growers of and dealers in rubber, cocoa, coffee, cane, rice, tobacco, bananas andother productions, now carried on by a company of the same name in the district of Emperador, Department of Panama, Republic of Colombia, South America ; to adopt an agreement between the said old company of the one part and T. H. Harrison (for this company) of the other ; and to carry on the business of rubber, cocoa, coffee, and general produce planters and merchants, miners, financiers, promoters, etc. The number of Directors is not to be less than two, nor more than seven.

Cardamoms in 1900. Cardamoms have, as usual, fluated considerably, says a H contemporary. The most remarkable feature about the art has been the manner in which it resisted the depressing fluence of increasing stock. The general tendency naturally downwards, but there were several recoveries intervals of three or four auctions, the drop being m continuous from September to the middle of November, w there was a sudden recovery owing to demands from In The firmness, however, was not maintained at the last auctio and in spite of large deliveries during November there been improving its position with the progress of the y stocks being lower and prices higher now than they were January.

Tea and Coffee in London. The *London Commercial Rec* of 28th ultimo, remarks :—Peo generally appear to believe in improvement in trade during the coming year, and parti larly a better demand for spot Tea and Coffee is anticipat for it is felt that the Home trade, which has ever since introduction of the new import duty on Tea and Coffee follow a strictly hand-to-mouth policy, must buy in order to replen their much diminished stocks. No doubt they would ha done so before, but having invested large sums in clear Tea and Coffee to avoid the new tax, they have lacked necessary funds. It is thought that by now they ha recovered, a good demand for spot lots is therefore anti dated in the near future.

Ceylon Green Teas. Mr. Larkin, the head of "Salada" Tea Co., was asked : "H are the Ceylon green teas going ?" "First-rate," he repli "better than we ever expected them to in the course of year. We are getting repeat orders from every place whe we have made a first sale and sent out samples. They are t finest green teas in the world and have only got to be tried be appreciated. We recommend all our friends to be t first in the field with the 'winner,' and this is going to Ceylon green tea. We predict that it will put Japan t entirely out of business in a few years, and then we will dealing with our own fellow-colonists. This is what we ha all been shouting such a lot about ; why not let us put it in practice by getting the consumers to taste these delicious teas.

Cinchona in 1900. Referring to Cinchona bark "the most important drug," t *British and Colonial Druggist* remarks :—The course of t Dutch auctions is, of course, the best gauge of this article progress. In January the unit was 8.9 cents. At the ne auctions it was 10.65 cents, and remained between 10 an 11 cents up to the seventh auction, when it rose to 11.7 cents, following this by a further advance at the next auctio to 12.25 cents. There was a drop, however, at the nint auction to 10.9 cents, and at the last auction to 8 cents. Th shipments of bark from Java were very small during th greater part of the year, and, although they have been large of late, the total shipment for the eleven months is much belo that of 1899 and 1898. The course of quinine is dealt wit under fine chemicals.

Coffee in London. Severe fluctuations have again take place in thetuaterminal market ; say the *Produce Markets Review* of 22nd ultimo : the continuanc

heavy receipts, which indicate a much larger crop than was pected, brought about a rapid fall, until the lowest point er recorded was reached ; there has been some recovery, wever, and rates close 1s. 6d. under last week. Estimates a record crop for next year are still general, but each season oves how unreliable such forecasts are, and the opinion is ily gaining ground that, however large the crop may be, values e now at the lowest, as a continuance of such prices will ll further increase consumption. Auctions have only been ld on two days, and will not re-commence until January 8, 01. Privately there is no desire to increase stocks, and ly quite a retail business has been transacted.

---

ylon's Staple Exports for 1900.

The Ceylon Chamber of Commerce figures for last year's total exports show the following results :—

Tea	148,431,639	lbs.
Coffee	10,773	cwts.
Cinchona	510,462	lbs.
Cocoa	33,476	cwts.
(A great falling-off.)		
Cardamoms	536,455	lbs.
Cinnamon (bales)	2,678,111	,,
Do. (chips)	1,863,406	,,
Cocoanut oil	443,959	cwts.
Desiccated cocoanut	13,604,913	lbs.
Plumbago	383,350	cwts.
(A great falling-off.)		

s regards the distribution of tea—

Russia took	8,917,815	lbs.
(More than double 1899's export.)		
Australia	17,606,912	,,
America	3,980,680	,,
"China"	1,262,463	,,

---

ea in Canada.

Canadian official returns show the imports of tea during the official ear ending 30th June, 1900, to have been as follows :—

	lbs.
Ceylon (all kinds)	6,857,585
India	4,643,291
China Black	2,843,872
Do. Green	1,234,106
Japan Tea	9,294,267
Other Countries	127,595
Total Imports ...	25,000,716

he Imports into Canada of India and Ceylon tea in

	lbs.
1898 were	5,439,023
1899 ,, ...	7,851,832
1900 ,, ...	11,500,876

his means progress, and it is specially noticeable that ccording to Messrs. P. C. Larkin & Co., of Toronto,) Ceylon reen teas are going ahead very rapidly.

---

ndian Tea in London.

The demand has been fairly active, and a larger business has been trans-cted than usual at this period of the year, says the *Produce Markets Review* of December 22, 1900. This is owing, in a reat measure, to the comparatively small stocks held by the ade, but more particularly to the exceptional value obtainable. here is no doubt the grades ranging from 5d. to 7d. have rely, if ever, been more favourable to the retailer, and, al-ough heavy supplies will be brought forward in January, ell selected Teas at these prices are not likely to be cheaper an they are at the present time. The Teas under the above rices have again shown an easier tendency, and a much larger uantity has changed hands under 5d. As the latest estimate of the crop available for this market is from 9,000,000 lbs. to 10,000,000 lbs. in excess of last year, and the quality of the Teas from Calcutta is reported to be inferior, it appears evident that prices will continue on a low level for some time to come. Teas from 8d. upwards of a useful character are not in very liberal supply, and, as there is a good demand for them, the market shows increased strength, and in many cases higher rates have been paid. The public sales comprised 43,494 packages, 8,374 of which were withdrawn.

Cinchona and Quinine in 1900.

The year 1900 ought, says the *Chemist and Druggist*, to be a memorable one for quinine speculators, as the article has again proved a veritable will-o'-the-wisp. The makers have done their best to stem the tide of speculation by refusing to make contracts with speculators, but they have only been partially successful. At the first cinchona-auctions in Amsterdam an average of 8·90c. per unit was paid, but at the second one the price advanced to 10·65c., dropping to 10·05c. at the third, and rising to 10·10c. at the fourth. From this period to the eighth auction in September there was an uninterrupted advance to 12·25c. (the highest point touched). In November the unit dropped to 10·90c., and again this month to 8c. The gradual advance from 10·10c. to 12·25c. was due to a falling-off in bark-shipments from Java, but unexpectedly large shipments were made during September, October, and November. There was then a deficiency of 1,100,000 Amst. lbs., to make up before the year closes, of which 470,000 was wiped off in the first half of this month. Meanwhile, the second-hand quinine-market has been influenced by every little wind that blew ; but makers have been very passive, only raising their price when absolutely compelled, and at one period an advance of ½d. was made when quite 2d. had been expected. Prices are 2d. cheaper to-day than in January. The notable alterations by makers were a reduction of 2d. in April and one of 3d. in December. The highest figure of the year was 1s. 7d., in September, at which time the second-hand market stood at 1s. 6⅜d. spot—also the highest.

Quinine in 1900.

The *British and Colonial Druggist* observes :—Quinine takes precedence in fine chemicals. Our first report in January recorded an advance in the second-hand market to 1s. 3¾d. Within a week the price had got to 1s. 4⅞d., and after a slight set-back rose the next week to 1s. 5¼d. German makers also advanced their figures to 1s. 5d., following on the advance in bark at the Dutch auctions in January, and Howard's advanced their price for 1-oz. vials to 1s. 7d. The feeling in the market was then very good, makers being busy, and eager buyers of the crude material. There was a slight fall, however, in the second-hand market before the January Java shipments were announced, and, in consequence of these, an advance to 1s. 5⅜d. In the middle of February the value had reached to 1s. 5⅝d., and one of the German makers had advanced his price to 1s. 6d. The following week the second-hand figure reached 1s. 6½d., falling to 1s. 6d. and Howard's price became 1s. 9d. "Bear" influences then became pronounced, and the price receded to 1s. 3½d. Short bark shipments in March improved the situation again, but only temporarily, and about the middle of April English and German makers made a drop, which brought Howard's price (in 1-oz. vials) to 1s. 8d. and German bulk price to 1s. 4½d., second-hand falling to 1s. 3d.

From this time till towards the end of July there was a period of depression, relieved by short-lived improvements at the end of May and June induced by small bark shipments. The third week of July, however, saw an advance of 1d. on the part of makers, consequent on the continued improvement in the bark market. A better tone then ruled in the second-hand market for some time, the price rising to 1s. 6⅝d. after makers had, towards the end of August, put up their prices another 1d. In the middle of September 1s. 7d. was reached, but then values began to fall away again, and in the first week of November German makers reduced their price 1½d. This declining tendency has continued since, the last drop on the part of German makers bringingt heir price to 1s. 3d., and Howard's figures being 1s. 7d., whilst second-hand price has got as low as 1s. 1¾d.

LETTERS TO THE EDITOR.

"FOXY COFFEE."

SIR,—With reference to Mr. P. G. Tipping's query *re* "Foxy Coffee" in your impression of the 5th instant, I think he will find the following information of some use. Speaking on the subject at the U. P. A. S. I. Meeting in 1899, Mr. Graham Anderson, C.I.E., said:—"This term ("foxy") denotes a reddy-brown appearance of the seed caused by the adhesion of the silver skin into which the colouring matter contained in the outer skin and fruity portion of the cherry has infiltrated. *This appearance is undoubted evidence of the fruit having been picked when quite ripe* (italics mine); and nearly all really good, cherry-dried coffee, which is so highly esteemed in France, is thus indelibly marked. The quality of the coffee is in no way injured, the stain being superficial and confined to the silver skin, which can easily be scraped off with a penknife. If roasted carefully, the aroma will be found excellent, which is another proof of maturity. If a quantity of ripe coffee fruit is heaped, or kept in a cistern, fermentation will take place, and the red colouring of the skin and fruity portions will sink into the gummy substance surrounding the "parchment," precisely in the same way that aniline ink penetrates the gelatine slab used for copying letters. If prompt measures are not adopted, not only will the parchment be permanently discoloured, but the silver skin below will be stained and firmly gummed on to the seed. If observed in time, the remedy consists of getting the fruit pulped as soon as possible; in closely watching the subsequent fermentation, and having the parchment thoroughly washed as soon as the gum has changed into a state in which it can be acted upon by water. In warm, rainy weather similar changes occur in very ripe cherry before it is picked from the trees. Some pulpers do not work satisfactorily and allow a large quantity of skins and half-pulped cherry to pass into the cistern along with the parchment. If these are not properly separated, before fermentation takes place, the seeds they contain will be more or less foxy. The ripest richest and most succulent fruit is always the first to suffer in this way, or from any delay occurring in "picking, pulping, or preparation."

Last season, in his desire to enhance the quality of his coffee, a proprietor hereabouts allowed his coffee to get dead, or purple, ripe on the trees before picking it, and to his thundering surprise, it was reported on from the Coast as foxy. Now his coffee had never before been reported on as fo His surprise was even greater when he was told that "foxiness" had probably been produced by his allowing fruit to become over-ripe on the trees before gathering it. the other hand, on a neighbouring estate, the coffee, wh had previously to *last* season been nearly always pronoun foxy, was that season singularly free of "foxiness." This attributed to a uniformity of shade over the place wh seems to have been attained for the first time in 1898- but the "trick" seems to have been done by washing coffee twelve hours after pulping it, the pulp-house havin position facing south-west, and the aspect of the estate be throughout nearly the same.

The obvious precautions which suggest themselves from foregoing are—

(1) To avoid, as far as possible, allowing the berries become dead, or purple, ripe on the trees. They should picked as uniformly red-ripe as possible. A spot of gr on the outside pulp will make no difference, the bean be nearly always matured before the pericarp has been fu coloured.

(2) To pulp the coffee as soon after taking in as possib The operations of pulping and measuring might go on sim taneously. Some power more expeditious than cattle-pow is desirable in this connection.

(3) To pulp as cleanly as possible. If pulpers are working satisfactorily, this must be done with the aid o sieve, the skins and half-pulped cherry being passed throu the pulpers a second time.

(4) To wash the coffee as soon as the mucilage is rea to be acted on by water. This can be determined by expe ment. For the rest, trust in Providence. I trust that t small contribution on the question will promote a healt discussion which will lead to the elucidation of a subj which there is no gainsaying is of great importance to t planting industry.

COORG, *9th January.* H. G. R.

NEW RUBBER.

DEAR SIR,—We received from our correspondent Zanzibar the following correspondence in connection w the new Rubber-yielding tree which appeard in your pap a few months ago. I think the plant ought to grow the plains up to a certain elevation above the sea-level.

THE AGRI-HORTICULTURAL SOCIETY, TEYNAMPETT, MADRAS, 15*th January*, 1901. B. F. CAVANAGH, *Superintende*

"*New Rubber.*—The tree referred to in your letter November 22, the fruit of which secretes a fluid which, wh coagulated, resembles guttapercha, has been identified at K as *Tabernæmontana*, sp., probably *T. Usambarensis*, a spec of the economic value of which nothing is known. T tree is known to the natives as *Mapumbukima* on account the curious shape of the fruit. It fruits and seeds free but the fruit is dehiscent and quantities of seed are in th way lost. The coagulated juice closely resembles gutt percha at first, but with time crumbles and will be foun I should think, of very doubtful economic value. We ha only 35 trees on this estate, but it is possible that the tree m be found distributed in the rubber forests of Pemba and the mainland. I hope to ascertain this later."

ARTIFICIAL MANURES: A WARNING.

SIR,—The recent discovery of arsenic in considerable antities in beer has been traced to the substitution for alt in the process of brewing of glucose or invert sugar epared with impure sulphuric acid, made from arsenical rites.

This was succeeded by the alarming announcement that e Manchester analyst has found arsenic in about equal antity in beer brewed from hops and malt alone.

The *Lancet* follows this up with the statement that the se of most artificial manures, *viz.*, superphosphate of lime—ade by acting on bone ash with common oil of vitriol—is rich easily soluble arsenic, which has been proved to be readily ken up from the soil by plants to which this arsenical anure has been applied ; and it is suggested that, as arsenic ccumulates in a soil which is being constantly dressed with perphosphates, its presence in malt may arise from this ause.

It is, therefore, necessary that planters should be on their uard against the possible risks from the use of superphos-hate, which forms a chief ingredient of certain advertised rtilizers ; it is advisable also that the presence of the same ontamination in other chemical manures, *e.g.*, basic slag, mmonium sulphate, etc., should be sought for.

Indian coffee cannot afford to incur the suspicion of being rown with the aid of arseniated manures.

17*th January*, 1901. KALASA.

GENERAL ARTICLES.

A TEA CESS FOR INDIA.

The Tea industry in India has not been very prosperous of late ears. Probably the chief cause of the decline in prices that has aused many estates to become unprofitable is over-production of ea. It is true that the consumption of this commodity has been n the increase, but it is equally true that production in India and eylon has increased to an extent that has more than neutralised he improvement in demand. Planters realise the soundness of the conomic axiom that excess of supply over demand involves a fall in rices. They see that there are, theoretically, two ways of putting hings right: (1) by lessening production, (2) by stimulating demand. Planters in Ceylon have for some years past adopted the second course with characteristic energy ; they are now considering whether they hould also adopt the first. Planters in India can hardly be said o have adopted either the one or the other. The Indian Tea Association has certainly done good work towards the improvement f demand, but its efforts have been crippled for want of funds equal —not to say proportionate—to those placed at the disposal of the Planters' Association of Ceylon for the specific purpose of pushing Ceylon teas in old and new markets. It may be a mere coincidence, ut we can hardly think so, that the increase in consumption of Ceylon tea, the more liberally advertised and canvassed, has been hore rapid than the increase in consumption of Indian tea, in ushing which less money has been spent. In Ceylon, planters oluntarily submitted themselves to a cess that, at their request, vas made compulsory. In India, a good many planters now vish to take a similar course, in order that ample funds may be rovided for advertising Indian teas, opening up new markets, and xtending trade in old ones. A somewhat similar course was ontemplated some years ago, but the Government of India held ut no encouragement. Lately, there has been a recrudescence f belief in the policy of submitting to a cess, and the Indian Tea Association addressed the Government of Bengal on the subject last nonth.

Dealing with the question in some detail, the Association eferred to the Ceylon precedent, and submitted copies of the eylon ordinance, imposing the tea cess (an ordinance passed, as we ave said, at the request of planters themselves.) The Association showed how this cess had enabled Ceylon growers to make greater progress in foreign markets than Indian growers. Reference was made to the present position of the tea industry and to over-production. It was pointed out that a tax of $\frac{1}{2}$ pie per lb. on tea exported would yield about $4\frac{1}{2}$ lakhs of rupees, or about four times the amount of present voluntary subscriptions and donations to the Foreign Market Fund of the Association. The Association does not see its way to establishing a universal cess without State aid. It remarked in its letter that to secure unanimous support among proprietors to a levy, without the intervention of Government, had been found impossible, not, it was believed, because of any antagonism to the object to be attained, but because no organisation sufficiently comprehensive to ensure subscriptions being paid by all proprietors could be brought into existence without State aid. Up to this point the representations of the Association are fair enough, and they make out a strong case for the imposition of a cess. In conclusion, however, the Association appears to have merely asked the Lieutenant-Governor of Bengal whether, in his opinion, the Government of India might be disposed to consider a proposal to institute a tax, if a large majority of tea proprietors expressed themselves in favour of it. Here, we think, the Association erred, it wasted time. The reply of the Lieutenant-Governor is very much what might have been expected. His Honour expressed a doubt whether the Government of India would agree to an export duty in any circumstances, least of all where the proceeds of the duty were not to be used for an imperial purpose. Further, if there were any doubt as to whether the proposal would really receive the practically unanimous support of the tea industry, the chances of a successful issue to the application would be extinguished. His Honour therefore recommended that the Association should take steps to ascertain the opinion of tea-growers regarding the proposal, and inform Government of the result. The Association has accordingly determined to send copies of the correspondence to every Tea Company and proprietor in England and in India, together with a covering letter asking for their support to the proposal by an early date.

This might just as well have been done earlier. Even a more satisfactory reply from the Lieutenant-Governor of Bengal would not have committed the Government of India to any particular action, and the matter is one in regard to which the decision of the latter alone is of importance. It stands to reason that the Government will hesitate to impose a tax on a minority at the request of a majority. Unless there is almost complete unanimity among planters success cannot be hoped for. Again, we consider it a mistake to ask for an export duty. As a matter of fact, a levy on shipments is perhaps the only form of levy that could be successfully collected; but planters should show themselves willing to pay a cess on production, not on export alone, so as to avoid the stigma attaching in the mind of the Government to any export duty. We would suggest also that when referring to proprietors the Indian Tea Association should give them an idea of the manner in which it is proposed to expend the cess, if levied. There will probably be many planters who will want more than a general statement that it is to be expended on advertisements or canvassing in such and such countries. That a good scheme might be organised is certain. The general principle of subscribing proportionately towards a huge fund to be expended for the benefit of the Indian Tea Industry as a whole is a capital one. But there are doubtless some who will think the $\frac{1}{2}$ pie in hand better than the chance of a whole pie, or even a whole pice or anna, should the efforts of the Indian Tea Association be successful and demand for Indian Tea largely increased. The subject is one that deserves the earnest consideration of every tea-grower, and we trust that planters in Southern India will give it close study. We trust also that they will show that in enterprise and "go" they have not the slightest intention of falling behind their Ceylon brethren.—*Madras Times.*

THE ART OF SINGING.

BY SIMS REEVES.

"Remedies for the Throat."

"All kinds of lozenges for the voice are to be avoided ; some do harm, others have no effect, and none do good. Sugar and water, or a little glycerine, gives relief when the throat is inclined to be dry ; this applies to persons whose throats are affected by the weather. About a third of a teaspoonful of Condy's Fluid in a tumbler of water, if used as a gargle every morning, will clear the throat and brace up the uvula, which, in some singers, is so long that it interrupts the pure emission of the voice, and introduces a grating undertone, while it also tends to make a tremolo on the upper notes."—*The Idler*, February, 1900.

STRAY NOTES ON MANURES.

Why we fertilize Land.—Prof. H. A. Huston, Indiana, writes in the *American Agriculturist*:—From time to time various theories of fertilization have appeared. One, which is apparently sound, is that as much plant food should be returned to the soil as is removed from it by crops. This theory can only be put into practice on lands where dairy farming or stock farming is the exclusive business. Even in these cases some little material would have to be brought from the outside to compensate for the necessary losses. It would be impracticable to use this theory with commercial fertilizers alone on account of the high cost and the fact that the grain will not stand up under full rations of available nitrogen.

The theory which is probably most generally used in Indiana, if we may be said to have any theory at all, is to supply some deficiency existing in the soil This may be done by either of two plans: Quickly available plant food may be used in sufficient quantities for a single crop, or less available and cheaper plant food for the more permanent improvement of the land.

Where commercial fertilizers are extensively used, the common practice is to supply the soil deficiencies for one or two crops at most. As for example, the wheat crop followed by grass, or the potato crop to be followed by grain. One of the most common questions asked in regard to fertilizers is, which element produces the straw and which the grain. I believe that little profit is to be derived from considering plants and fertilizers from this standpoint.

The sound position to take is to provide such plant food that To parts of the plant will make a vigorous and healthful growth. all be sure, where excessive quantities of nitrogen are present, the plant tends to produce an undue amount of leaf and reduced amount of grain, but in practice this seldom happens except on recently unclaimed muck lands or bottom lands.

Muriate of Potash and nitrate of soda give better results with grass and mangel wurzels than when the nitrogen and potash are secured in the form of nitrate of potash.

The Use of Gypsum about a stable where nitrogen is liable to escape as free ammonia is highly recommended. It is also valuable to sprinkle over manure heaps where ammonia is escaping.

Sandy Soil ought not to be heavily manured at any time, but should receive frequent small applications.

A TYPICAL TEA ESTATE IN THE HIMALAYAS.

The following is from the Travel and Colonisation column of *The Field*:—

Nearly 3,000 ft. above the sea stands a bungalow (like a Swiss chalet with overhanging balconies, and deep verandahs). on a small platform of rock, only reached by a steep zig-zag path up the mountain side. In this lives the owner or manager of the "tea garden," isolated from all other Europeans save, perchance, one or two in like position to himself, on different estates adjoining. On the mountains above is nothing but dense virgin forest, clothing their steep sides even to the depths of the river beds far below. From this solitary eyrie, stretched out in the valleys below, as far as the eye can reach (which on a clear day may be fifty miles), are endless tea gardens. Shall I describe such an one?

The tea-shrubs are planted about five feet apart, and instead of growing into tall, lanky bushes, are kept pruned and clipped into a round close bush about two to three feet high. The leaf is picked from the young shoots, the best and most delicately flavoured tea being that which is made from the topmost shoot, not yet unfolded. The picking of the leaf is carried on from March till November or December, according to the amount of rain. On the garden the writer is describing, the yearly rainfall is 230 in., and 12 in. is known to fall within twenty-four hours. When the tea-shrub becomes mildewed or attacked by red-spider, it is dusted over with sulphur, but the great enemy of the tea grower is the "stinging slug," whose chrysalis, unless minutely examined, cannot be distinguished from the actual seed-pod of the shrub, and the slug stings so horribly that the coolies refuse to pick where it is found.

Over each gang of pickers (consisting of men, women, and children) are men put in charge to see that the leaf is properly picked and placed in the baskets which each coolie carries, of a very curious shape, slung over the shoulder. Let us follow them to the factory, a large shed-like building covered with corrugated iron. The contents of each basket are duly weighed, emptied out on the factory floor, and then begins the process of tea making. The leaves are shovelled in between two huge rollers, and squeezed out on to the floor below, where they are spread into flat heaps, and generally left to ferment for twelve hours.

The next process is that of drying. The heaps on the floor are transferred to wire trays, in layers, in a huge furnace-like machine, and in a very short space of time the leaf is sufficiently dried. When at this stage, it should be of a dark bronze colour and crisp—very different to the sodden mass that appeared beneath the ruthless rollers. Next comes the sifting of the tea-leaf through gigantic sieves of different sizes. This makes and determines the various qualities of tea. The finest and best is Pekoe, the smallest leaf left in the topmost sieve; the next, Pekoe Souchong; and, finally, Souchong, the largest leaf of the three. The "Fannings" are inferior, composed of the general leavings and remnants. Now the tea is ready for packing, and is promptly ladled into wooden boxes and tin cases, all of which are made in the factory yard outside. The tea leaf can be used a few weeks after making, but is better kept a month or two longer. At the busiest time of year the whole process, from the picking of the leaf in the garden to the packing of it in boxes, can be accomplished in the twenty-four hours, the coolies often working till quite late at night.

On an estate of 900 acres about 900 coolies, including woman and children, are employed, and 258,000 lbs. of tea made and packed, though, of course, many more pounds of the natural leaf have to be packed to make this quantity. The ceaseless care and attention on part of manager or owner, the constant supervision of coolies on the garden and in the factory, the rising early, and late taking of rest, the perpetual anxiety as to when the rains will "break," and, when broken, the suspense of watching the roaring torrents through the valleys as to whether the bridges that connect the garden with civilisation and railways will not be swept away; all these can only be appreciated by those who have done it, or watched it done, in that far-off "land of regrets." How few think of this as they daily sip their cup of tea!

UNITED STATES TEA EXPERIMENT.

For three-quarters of a century, says the *American Grocer*, attempts have been made to make tea-growing a profitable industry in the United States. At the South Carolina Experiment Station, Doctor Shepard is endeavoring to utilize the labour of idle coloured folk, including children, with fair success. In his annual report to Congress, Secretary of Agriculture states that the experiments so far conducted have shown that tea may be produced in the United States in two ways: First, by families in their gardens, as was demonstrated years ago to be entirely feasible; second, on a commercial scale, after the manner followed by the British East Indian tea establishments and the beet-sugar industry.

The work at Summerville was started with a view of ascertaining whether under favourable conditions tea plantations could be made to yield as much as the average oriental production, and whether the crop could be marketed at a fair profit. The results obtained have been affirmative, the crop of 1900, although not so large as expected early in the season, exceeded that of any previous year by at least 12 per cent., and the entire product being sold before it was all gathered to a prominent Northern distributing house—F. H. Leggett & Co.—at a price that gave a fair profit.

As a further evidence that tea can be profitably grown in the United States, capitalists are already making preparations to begin the work in certain parts of the south on a more or less extensive scale. A company with a capital of $50,000 is being organized, and will endeavour to secure a location having soil and climatic conditions adapted to the growth of tea, and where labour, such as Doctor Shepard utilizes, can be secured.

From what has already been accomplished, it has been shown that a good grade of tea can be grown and put on the market in bulk at a cost not exceeding 15 cents per pound. Under average conditions an acre will yield 400 pounds of marketable tea, and this, at 15 cents per pound, would make the expense of growing it $60 per acre. The tea should sell in bulk for at least 30 cents per

pound, and the profit on this basis would be 100 per cent. Besides the cost of marketing, however, there are other expenses to be considered, namely, the salary of a superintendent and the interest of the money invested in the plant, which would, of course, cut down the profits.

From the foregoing, it seems that the commercial possibilities of tea production in this country can no longer be questioned, but there are still many points to be settled, especially as regards the improvement of the product. During the past year experiments have been undertaken for the purpose of determining the effect of irrigation on tea and of shading the plants from the direct rays of the sun. Work has also been inaugurated with a view of reducing the cost of the preparation of tea, especially the green tea. The experiments in irrigating and shading, which will be continued, have given promising results, the shaded plants giving nearly double the yield of the unshaded, and a much finer grade of leaf.

In the future special attention will be given to manufacture of pure green tea. This subject is now claiming the attention of both inventors and planters in the British colonies, as they begin to realize the hopelessness of bringing American tea-drinkers to use the black tea instead of the green. The manufacture of green tea in the United States can be made successful only by the invention of machinery which shall take the place of expensive hand labour and prevent the waste which accompanies the latter. The questions are all being investigated by the Department, and, in addition, it is giving special attention to a study of the conditions in various parts of the south, with reference to determining the localities where tea can be grown to best advantage. Experiments have been inaugurated by some of the experiment stations, and plants distributed witha view of putting the work on a substantial basis. Much need is felt for young men capable of taking up this important problem, and it would be well for the Agricultural colleges of the south to bear this matter in mind.

THE CEYLON TEA INDUSTRY.

[From the *Board of Trade Journal*, November 15, 1900.]

During the year 1898 it was supposed by local authorities that the tea planting industry in Ceylon was fast approaching its maximum of production, which would probably be reached with an export of between 120,000,000 lbs. and 130,000,000 lbs. Although, however, it is stated in the *Ceylon Government Gazette*, of 18th ultimo, that the raising of the rupee by the Indian Government to the value of 16d. gave a decided check to the further planting of tea, yet more liberal cultivation through the application of manure has let to increased crops—385,000 acres to 390,000 acres are now under tea cultivation —and the present year is likely to give an almost unprecedented advance. This will be seen from the following statement, the figures for 1900 being the revised estimate issued by the Committee of the Planters' Association a few weeks back:—

Total Exports of Ceylon Tea.

Years.	Quantity exported.	Increase on previous year.
	lbs.	lbs.
1896	108,141,412	10,000,000
1897	116,054,567	8,000,000
1898	119,769,071	3,700,000
1899	129,894,156	10,000,000
1900 (estimate)	142,000,000	12,000,000

This large increase of production, accompanied by similarly expanding crops in India, has caused anxiety lest consumption should be overtaken and exceeded; but hitherto, with the increased demand for Ceylon teas in Russia, America, and Australia, the surplus has been nearly all taken off. In the United Kingdom it was feared that the increase of the Customs duty from 4d. to 6d. per lb., as a war tax, would check consumption; but this has not been the case, although the average price realised for Ceylon Tea in Mincing Lane has fallen compared with the average in 1899—in which year there was a slight improvement in prices over the previous year. The average for the first nine months of this year of Ceylon tea in Mincing Lane is only about 7¼d. per lb. against 8d. per lb. for the same period of last year. On the other hand, the disturbances in China, leading to some interference with the usual overland transit of tea to Russia, may possibly lead to the transfer to Colombo of an increasing proportion of the trade. Already Russia is proving one of the best customers for Ceylon tea, as will be seen in the following table:—

Export of Ceylon Tea to Russia.

Years.	Quantity exported. lbs.
1896	201,313
1897	439,349
1898	2,714,003
1899	3,949,740
1900 (up to 8th October)...	6,584,343

As one of the results of the Tea Court at the Paris Exhibition, and of the work of the "Thirty Committee" through their special agent, an increased demand for Ceylon tea on the Continent of Europe generally, as well as in Russia, may be anticipated. Then, too, the endeavour to meet the requirements of the American market by a supply of pure green teas should gradually tell, while the shipment of ordinary black teas to the same market steadily increases.

Altogether, therefore, the prospects of the great tea industry of Ceylon are not unsatisfactory. although much may depend on the judicious management of plantations, in respect not only of the "plucking" of leaf, but also of the application of fertilizers calculated to sustain and invigorate, rather than unduly stimulate and possibly injure, the tea bush. There has been less trouble with blights—grey and brown—than last year, and the methods of dealing with these diseases are becoming well understood.

COFFEE-PLANTING IN SUMATRA.

An ex-Ceylon planter, who signs himself "W. T. McK.," sends to the *Ceylon Observer* a very interesting letter from Serdang (on the East Coast of Sumatra), accompanied by a photograph, which, our contemporary says, shows magnificent giant coffee trees (backed by Albizzias) laden with crop. The letter is as follows:—

NOTES FROM SERDANG, EAST COAST OF SUMATRA.

Some time ago I promised you Liberian coffee figures from here: and now by the kindness of the Chairman of the Serdang Koffie Planters, Vereeniging, I am enabled to send you a copy of the official figures of the district. By this post I also have the pleasure of sending you a photo, showing coolies picking coffee on Greahan Estate from trees not yet four years old. The gentleman in the hat is the Javanese Head Mandor, a much bigger swell than the head kankani, in Ceylon. The lady with the cane is the picking mandor, and the other figures on the ground and up the ladders are members of her picking gang [plump-looking females, not unlike Sinhalese women in size and dress.—Ed., *C.O.*]. The box she is examining is a framed kerosine oil tin, which, oddly enough, is our standard measure. Our coffee pioneer here (a genial Italian, rest his soul! his house is like Sheriff's in the old days at Helbodde) discovered that 60 kerosine tins of cherry gave one picul of clean coffee, and that standard has been universally adopted in Serdang.

To practical planters the figures will speak for themselves. When I came here early in 1895 there were three small estates, aggregating about 200,000 plants. The bulk of the district has been planted from '97 onwards. Planting distance varies; but an average may be calculated on of 400 plants to the acre, so that the 4,000,000 plants shown in the table represent roughly 10,000 acres. Three small estates give no return.

Transport is our great difficulty. The far end of the District is 40 kilometres, close on 25 miles, from the railway, over *mud* roads, which, though they harden well enough in the dry season, pull the legs off cattle in wet weather. From where I write it is three hours' driving to Loba Pakam in fine weather: and seven hours, if the roads are heavy!! Four years ago we were assured we should have a railway within six months. But at the present rate of progress, the trees from which the sleepers are to be cut, have not yet started to grow.

Apropos of the coffee figures, it is perhaps worth while repeating the following paragraph from my last notes:—"The old trees of Tanah Abang were planted in 1880 and are 20 years' old. They

were abandoned for seven years when Giovanni took them up, and all now that is left of them are bearing about four to five katties a year each. Enormous." One katti = 1⅓ lb. Avoirdupois

The following para. is from p. 346 of the *Graphic*, September 8, 1900:—"The Germans have been quick to recognise the possibilities of this region (Uganda), and their enterprise in East Africa is remarkable. Five years ago the home Government appropriated 800,000 marks *for the establishing* of a coffee plantation not far from Tanga. The first year, *I was told*, the yield paid expenses; the third year it equalled half the capital; fourth year, the entire capital; and in the last twelve months the plantation has made a profit of 400,000 marks." The italics are mine. The *Graphic* correspondent is careful to cover himself with "I was told." As to the letter, the wonder is that the young men did not arise, wind him up, carry him out, and bury him. Each of the five years is accurately accounted for, so this wonderful plantation must have paid expenses while the plants were still in the nursery! A planter in this district (Serdang) who went to German East Africa two or three years ago, returned here. I hardly think he would have done so if he had realised the prospects as described in the *Graphic*.

A friend recently pointed out to me what he called a "strange omission" in Ballardie's and Owen's, "Buildings." "There are no stables" said he, and I had to draw him a plan for stabling six horses, two carriages, harness-room and quarters for three syces. Horses and ponies are a necessity in this country: and I think many estates in Ceylon might be better worked if the assistants had ponies to help them from point to point, or to bring them home from work at mid-day after a stiff four or five hours on foot.

Here's to a good New Year to Ceylon. May prices rise, and all proprietors renounce the sweating system!

Clean Coffee.

* Not certain.

IMPORTS AND CONSUMPTION OF TEA IN THE U. S.

The last Treasury Bulletin reports the imports of tea for October and for the ten months ending October 31. The total imports at all ports were, says the *American Grocer*, 17,173,895 pounds in October, 1900, against 8,797,035 pounds for the corresponding month in 1899. For the ten months they reached 79,715,847 pounds, against 68,913,738 pounds for the same time in 1899, and 54,887,062 pounds in 1898. The imports came from the following countries:—

	Pounds
United Kingdom	1,867,310
British North America	1,026,068
China	42,710,639
East Indies	2,601,127
Japan	28,964,619
Other Asia and Oceanica	2,513,070
Other countries	33,014
Total ...	79,715,847

During the fiscal year ending June 30, 1900, the total imports were 80,088,328 pounds, valued at $10,835,194. Duty collected, $8,008,637. Average import value, per pound, ·135 cents; *ad valorem* rate of duty, 73·91 per cent.

The following statement shows the movement for the ten months ending October 31:—

	Pounds.
Tea in Warehouses, December 31, 1899	41,729,509
Imports for ten months, 1900	79,715,847
Total supply	12,1445,356
Less tea in Warehouses, October 31, 1900	47,183,653
Distribution for ten months	74,261,703
Exports of tea for first ten months, 1900	1,003,208
Home deliveries	73,258,495

Taking the above basis, we may look for a total consumption this year of 86,000,000 to 90,000,000 pounds, or a per capita consumption of about 1·13 to 1·20 pounds, which is a decided gain over recent years, but considerably lower than was the per capita use from 1885 to and including 1897. Evidently tea is regaining part of its lost position, and probably the consumption would mount up to over 100,000,000 pounds were the duty removed.

TEA MARKETS.

In a communicated article in *Capital*, 'J' says:—

As so much has been written in all our contemporaries regarding the benefits that might be derived from selling teas on the Calcutta markets, we see no reason why we should not have our little say in the matter as well, and, there are a few pertinent questions we should like our brokers and others, who uphold selling in Calcutta, to answer. First, and foremost, comes the very prominent one—Why do gardens not profit by it more than they do; if it be the case that the Calcutta market is higher than London? Have all our garden agents gone to sleep; or, what explanation can be given regarding their missing such a chance? How comes it, secondly, that the market lately has been considerably below London prices? If the great foreign markets, which are continually flaunted in our faces, are so poorly fed, why, do they not come forward now, when there are so many withdrawals, and get their wants supplied? Why do the brokers say that the Bombay buyers seem disinclined to act even at present very low rates? It seems quite impossible to reconcile the two statements, that the market is kept denuded of supplies, and, almost in the same breath, that the buyers seem disinclined to operate, at what might be termed, ruinous rates; in fact, they could hardly offer less, unless they wanted the tea as a gift! We have followed the course of the teas of several home companies, who, acting on the advice of their Calcutta agents, put a portion (the suitable one mark you) of their crop on the Calcutta market, but the result has not been what might have been expected, and the experiment is not likely to be repeated. After all is said and done, the London market rules the Calcutta one, and any amount of writing will not alter this, until such time as a taste for common teas is educated and pushed on in India, when it may pay

sell Souchongs, and fannings and the lower classes of teas; but til that is fairly established, the Russian market can be supplied cheaply from Mincing Lane as it can from Calcutta; in fact, eight in bond from London to Trebizonde is less than it is from alcutta to Trebizonde, more especially when landing and tranipping charges at Port Said are taken into consideration. A lcutta buyer lives upon what profits he can make out of the teas buys, and if an estate is in a strong financial position, it stands reason that it must pay to ship its produce to the ruling market: ere is no reason why it should not pocket the profit the buyer akes. We imagine we hear those most interested exclaiming Yes, quite so, when there is a profit!" We are well aware there ve been heavy losses this season, more so perhaps than usual, but, though losses are always dinned into one's ears, profits are seldom ard of; yet we see the buyers annually, like the swallows, appearg in the Spring, and we hardly think that this would be the case ere their losses perpetual. By all means let us have a alcutta market, but do not over-rate it and make it harder for e unfortunate manager, if his teas brings only 4 annas or so, for ou may rest assured he has it dinned into his ears from home at his neighbour, who sells in London, has got 6¾d. or 7d. verage, which is equal to, according to Calcutta brokers, about 5 to ¼ annas. From figures of several companies before us, it takes bout one penny to one penny farthing to sell teas in London, so that anna average is equivalent to 5d. or 5¼d. in London. How comes that our brokers then, in putting the correlative values of tea verages in pence and annas, allow from 1½d. to 1¾d. per lb.? Where oes the extra ½d. or ¾d. go? If a company can sell its teas at 1d. 1¼d. per lb., for freight charges, etc., why cannot a Calcutta uyer do the same? In the case of one company, whose figures are efore us, 91d. covers all charges from Calcutta to the nett proeeds paid into the Bank, but we have, no doubt, this is exceptionally ood management. Still, it shows that it can be done, and that it in the economical management in the handling of its crop that he tea industry must look for any relief from the present tight orner in which it is placed. On estates, economy has reached its mits. To pluck the leaf a certain amount of money must be spent, ust the same as an amount must be spent for manufacturing the ame, tilling the ground that gives the leaf must also be attended o, and a certain expenditure incurred. Establishments have been ut down as far as they can be economically, and we can only suggest that London, and Calcutta warehousing charges should be educed. The brokers say, no doubt, that they have to do double s much work for the same pay as they used to, but, it is the ame with the manager and assistant on the tea garden itself, but here seems no reason why lettering, marking, inspecting in alcutta, should not give way somewhat in the same way as the harves in London have done, and we hope will do, to a greater xtent yet. Far be it from us to deny the labourer hire in proporon to the work done, but, it has always appeared to us that this harge of 4 annas is excessive, and we have no doubt our brokers, properly approached, would be amenable to reason, and also that ose who have had such a sunny harvest in wharfage will meet he industry in its days of distress in a liberal way. At least, we enture to hope so.

TEA AND COFFEE.

A Parliamentary Return recently issued gives voluminous tatistics of the imports of tea and coffee into the principal ountries of Europe and into the United States. The follow-ng shows the exports of tea from the four principal countries f production during the past three years :—

Tea Exports.	1897.	1898.	1899
	lbs	lbs.	lbs.
ritish India	153,482,000	154,122,000	159,806,000
eylon ...	114,466,000	122,395,000	129,062,000
hina .	204,267,000	205,200,000	217,467,000
apan ...	63,906,000	61,532,000	———

It will be seen that China is still the largest exporter of tea, hough the quantity exported is, by no means, as large as it used to e; thus, in the period 1884—86 the amount of tea exported from hina averaged 282 million lbs., whilst in the period 1897—99 it veraged 209 million lbs., a decrease of 26 per cent. Meanwhile, the exports of tea from the three other producing countries have been constantly increasing of late years. In the case of both, British India and Japan, the exports have doubled in the last sixteen years, whilst in the case of Ceylon the export, which is now nearly 130 million lbs., was in 1884 only 2 million lbs. From the statements attached to the present memorandum it appears that the tea produced in British India and Ceylon is sent mostly to the United Kingdom, whereas the larger part of the tea exported from China goes to Russia, either overland or by sea; also in some measure to the United States, where the bulk of the tea exported from Japan also goes.

The production of coffee, like that of tea, is largely increasing, and may be said, speaking generally, to have doubled in the last ten years. The chief producing countries are all in America, Mexico being the most northern, and Paraguay the most southern of the countries of that continent where coffee is produced. The chief countries of production, in the order named, are Brazil, Venezuela, the United States of Colombia, Mexico, Costa Rica, Guatemala, and Hayti. The United States holds a very similar place in the coffee trade to that held by the United Kingdom in the tea trade, the relative consumption in each case exceeding that of all the other countries of the civilised world put together. The coffee trade of the United States, therefore, may be said to virtually control the trade, as well as to a certain extent the prices, of coffee throughout the world.—*Daily News.*

DISTRICT ASSOCIATIONS.

INDIAN TEA ASSOCIATION.

Extracts from Abstract of the Proceedings of a Meeting of the General Committee held at Calcutta, on January 8. There were present:—Messrs. H. C. Begg (Chairman); W. Brown (Vice-Chairman); H. S. Ashton; R. H. A. Gresson; R. Magor; A. Tocher; R. R. Toynbee, and T. Traill.

Letters, dated 7th, 14th, and 20th December, from the Secretary, Indian Tea Association, London, were brought up for final consideration and disposal, after previous circulation. The principal matters dealt with in these letters were—

British Import Duty.—With his letter, dated 14th December, Mr. Tye forwarded copies of a petition to the Chancellor of the Exchequer for the reduction of the British Import duty on tea from 6d. to 4d. per pound. In the letter of 20th December, it was stated that the petition had been presented to Sir Michael Hicks Beach, on the 14th December, but had been unfavourably received. Sir H. Seymour King, M.P., who presented it, had announced his intention of moving, in due course, a resolution in the House of Commons in favour of the reduction, and of pressing it to a division. An identical petition had been presented to the Chancellor of the Exchequer, on behalf of the Ceylon Association, by Mr. E. Thompson Sharpe, M.P., for North Kensington. It had likewise been unfavourably received; and in reply to an enquiry by Mr. Sharpe, Sir Michael Hicks Beach had stated that he declined to receive a deputation on the subject.

The General Committee noted the foregoing with regret. They considered and approved of the draft letter to the Government of India (referred to in the proceedings of the meeting held on 4th December), on the question of the duty, and directed that it should be issued forthwith. Copies were to be published to members of the Association and to the Press in due course.

Assam Labour and Emigration Bill.—With his letter, dated 14th December, Mr. Tye forwarded copies of two letters, addressed respectively to the Secretary of State, and to the Government of India protesting against the increase of the minimum rates of Labourers' wage, contemplated in this Bill. These letters dealt with the subject at length; and that addressed to the Secretary of State had been sent to Lord George Hamilton, with a letter in support, by Sir H. Seymour King, M.P.

On the 5th December, the Committee had addressed the Government of Bengal, in the Revenue Department, on the question of the imposition upon Indian tea of an Export duty similar to that which has been levied in Ceylon since 1892. That is to say, a duty, the

proceeds of which would be devoted to the work of pushing the sale of Indian tea in foreign markets. In the letter the Committee had dealt with the question in some detail They had referred to the precedent of Ceylon, and had submitted copies of the Ceylon ordinances imposing the tax. They had shown how by means of the funds raised by the tax, Ceylon growers had been able to make greater progress in foreign markets than Indian growers, and they had quoted figures in support of this statement. They had also referred to the present dangerous position of the Indian tea industry; and had laid stress upon the fact that the over-production from which it is now suffering is largely due to extensions which were planned and undertaken when the rate of exchange with Europe was at a low level. They had further pointed out that a tax of half a pie per pound of tea exported from India would yield about 4½ lakhs of rupees yearly, or four times the amount of the present voluntary collection. They had added that to secure unanimous support among proprietors to a levy, without the intervention of Government, had been found impossible; not, as they believed, because of any antagonism to the object to be attained, but because no organisation sufficiently comprehensive to ensure subscriptions being paid by all proprietors could be brought into existence without State aid. In conclusion, they had asked whether, in the opinion of His Honor the Lieutenant-Governor, the Government of India might be disposed to consider a proposal to institute a tax, if a large majority of tea proprietors expressed themselves in favour of it.

The Bengal Chamber of Commerce had also, at the request of the General Committee, addressed the Local Government in support of the representation.

A letter, dated 4th January, from the Government of Bengal, was now before the Committee. It was pointed out in it that legislation such as that proposed had been undertaken in India; and His Honor the Lieutenant-Governor doubted whether the Government of India would agree to an export duty in any circumstances, and least of all where the proceeds of the duty were not to be used for an Imperial purpose. If there were any doubt as to whether the proposal would really receive the practically unanimous support of the tea industry, the chances of a successful issue to the application would be extinguished. His Honor, therefore, recommended that the Association should take steps to ascertain the opinion of tea-growers regarding the proposal, and inform Government of the result.

The General Committee noted this reply with some regret. In view of it they determined to send copies of the correspondence to every Tea Company and proprietor in England and in India, together with a covering letter asking for their support to the proposal by an early date.

It was announced that the American and Foreign Market Fund for the current season had reached one lakh of rupees. In accordance with the decision previously arrived at (see Circular No. 66 of 16th November, (1900), the Secretary was instructed to publish a list of subscribing gardens.

Proceedings of a special General Meeting of the Association held on 8th Jan. There were present:- Mr. H. C. Begg, Messrs. Begg, Dunlop & Co.; Mr. W. H. Miles, Messrs. J. Mackillican & Co.; Mr. A. Tocher, Messrs. Duncan Brothers & Co.; Mr. R. Magor, Williamson, Magor & Co.; Mr. H. S. Ashton, Shaw Wallace & Co.; Mr. R. H. A. Gresson, Messrs. Jardine, Skinner & Co.; Mr. W. Brown; Messrs. Finlay, Muir & Co.; Mr. W. C. Aldam and Mr. E. A. Woodhouse, Messrs. W. S. Cresswell & Co.; Mr. E. S. Stewart, Messrs. Lyall Marshall & Co.

The meeting was called for the transaction of the following business:—

(*a*) The consideration, and, if so decided, the adoption of a resolution substituting the word "February" for the word "April" in line 6 of Rules of the Association.

(*b*) The consideration, and, if so decided, the adoption of a resolution, under which the year of the Association shall extend from the 1st January to 31st December, instead of from 1st March to 28th February as at present.

In opening the proceedings, the Chairman said:—Gentlemen,—This special General Meeting has been convened for the purpose of altering the date of the Annual Meeting from April to February. April, as we all know, is one of the hottest months of the year, when, I take it, few of us care to leave our desks to go and listen to a long account of the year's proceedings, however interesting that may be. But apart from that, the change will bring the Annual Meeting more into line with the tea season, and I venture to think in other respects it will likewise be more convenient. Your Committee therefore decided, in conformity with the Rules of the Association, to call a meeting with a view to obtaining your sanction to the proposed change, and I feel sure you will all agree to it. The change, I am afraid, will involve some extra pressure on our Assistant Secretary, whose duties at all times, but particularly during the cold weather months, are of an arduous nature, but I am confident if called upon to do so he will use his best endeavours to get the report out in time for the altered date of the meeting.

The Chairman then proposed and Mr. H. S. Ashton seconded the following resolution, *viz.*:—"(*a*) That the word "February" be substituted for the word "April" in line 6 of Rule 5 of the Rules of the Association, and (*b*) that on and from the 1st January, 1901, the year of the Association shall extend from the 1st January to 31st December, instead of from 1st March to 28th February as heretofore."

The resolution, on being put to the meeting, was unanimously adopted.

The proceedings then terminated.

THE CEYLON PLANTERS' ASSOCIATION.

PROCEEDINGS IN COMMITTEE.

Extracts from minutes of proceedings of a meeting of the Committee of the Planters' Association of Ceylon held at the Victoria Commemoration Buildings, Kandy, on 11th January, 1901.

VISIT OF THEIR ROYAL HIGHNESSES THE DUKE AND DUCHESS OF YORK.

Before commencing the business on the Agenda, the Chairman mentioned the notification made by His Excellency the Governor regarding the approaching visit of Their Royal Highnesses the Duke and Duchess of York and invited an expression of views as to the best form of entertainment in connection with the proposed stay in Kandy. Resolved:—"That a Sub-Committee be appointed consisting of the Honorable Mr. J. N. Campbell, Messrs. E. Webb, T. C. Huxley, the Chairman Planters' Association of Ceylon; and the Secretary, Planters' Association of Ceylon, to ascertain whether it is possible to obtain a sufficient number of subscribers to give a Planters' Ball in honour of Their Royal Highnesses the Duke and Duchess of York on their approaching visit to Ceylon."

THE TEA INDUSTRY AND OVER-PRODUCTION.

The Chairman introduced the question and a discussion followed thereon. Resolved:—"That a Sub-Committee be appointed to go into the question as to the best means to be adopted to cope with the question of over-production with power to add to their number to consist of the Chairmen of the various District Associations, members of the Kandy Committee, Chairman, Planters' Association of Ceylon, and Secretary, Planters' Association of Ceylon; and that the Committee of the Chamber of Commerce be also invited to serve."

THE IMPERIAL FISCAL FEDERATION FOR PROTECTION OF BRITISH INTERESTS.

Read letter from the United Planters' Association of Southern India, transmitting copy of the following resolution and inviting consideration and co-operation—"That considering the critical condition of the tea and coffee industries, this Association do communicate with the Indian Tea Association, the Ceylon Planters' Association, the Indian Chambers of Commerce, and the leading firms of merchants and brokers interested in tea and coffee, etc, in this country and in England and her Colonies with a view to ascertaining whether a movement in favour of a commercial combination of Great Britain and her Colonies and India against the world (which would by a system of differential duties afford some protection to British-grown products and manufactures) would receive support." Resolved:—"That the Committee does not feel able to co-operate in the manner suggested."

INCREASED CUSTOMS DUTIES ON TEA AND OTHER PRODUCTS ENTERING FRANCE FROM COUNTRIES WHICH DO NOT ENJOY MOST FAVOURED NATION TREATMENT.

Read letter from the Ceylon Chamber of Commerce transmitting copy of letter addressed to the Ceylon Association in London. Resolved:—"That the Ceylon Association in London be again invited to continue to watch further developments in this important question.

CEYLON ASSOCIATION IN LONDON.

Read correspondence with the Ceylon Association in London and submitted memorial transmitted by the Ceylon Association in London to the Right Honourable Sir Michael Hicks-Beach, M.P., Chancellor of the Exchequer, dated London, 10th December, which was presented by Sir H. S. King, M.P., and Mr. W. E. Thompson-Sharpe, M.P., as representing the Indian and Ceylon Associations in London.

Submitted sample of tea referred to in the letter of the Tea Buyers' Association, dated 2nd November.

Submitted copy of letter from the Tea Buyers' Association, dated 23rd November, and sundry papers connected with the Venesta chests with which fault is found.

Submitted correspondence between the Secretary, Ceylon Association in London, and Mr. J. R. Rae, of Chester.

REDUCTION OF THE BRITISH TEA DUTY.

Read letter to Government.

THE THIRTY COMMITTEE.

Minutes of proceedings of a meeting of the "Thirty Committee" held at the Victoria Commemoration Buildings, Kandy, on the 12th January, 1901.

CEYLON GREEN TEAS, 1900-1901 SCHEME.

Submitted letter from Mr. Edgar Turner. Submitted correspondence from various applicants for grants. Resolved:—"That in confirming the application to Government for Rs. 20,000, sanctioned by the Governor in Executive Council by letter of the 10th January, the sanction of the Governor in Executive Council be applied for to the appropriation of a third sum of Rs. 30,000 as desired and determined by the "Thirty Committee" for the purpose of payment under the grant for Ceylon Green Teas, New Scheme, in terms of resolutions on the subject of Ceylon Green Teas' Grant, 1900-1901 Scheme, referred to in letter of the 4th October, 1900."

COMMISSIONER ON THE CONTINENT OF EUROPE.

Submitted correspondence. Resolved:—"That the sanction of the Governor in Executive Council be obtained to an appropriation of £8,000 sterling for pushing and advertising Ceylon tea on the Continent of Europe for 1901."

PARIS INTERNATIONAL EXHIBITION, 1900.

Submitted correspondence. Read letter from Government requesting to be furnished with a cheque for the sum of £2,000 be remitted towards the expenditure connected with the representation of Ceylon at the Paris Exhibition.

Intimated that the cheque for Rs. 30,000 had been forwarded and an acknowledgment thereof received.

CEYLON TEA IN AMERICA.

Submitted correspondence. Resolved:—"That the sanction of the Governor in Executive Council be obtained to an appropriation of £8,000 sterling for pushing and advertising Ceylon tea in America during 1901."

CEYLON TEA IN SWEDEN.

Read letters from Mr. A. J. Austin Dickson acknowledging receipt of cheque for Rs. 230·63 in settlement of his claim for expenditure incurred in advertising Ceylon tea in Sweden under the provisional credit of 1899.

CEYLON TEA IN GERMANY.

Read letter from Messrs. Eck Brothers acknowledging receipt of cheque for Rs. 421·89 in settlement of claim stated for expenditure incurred in advertising Ceylon tea in Germany under the provisional credit of 1899. Intimated that a cheque for Rs. 3,320·49 had been forwarded to Mr. J. P. Ryan in connection with his expenses on his mission to Berlin.

CEYLON TEA IN MANILA.

Read letter to Mr. J. H. Stephens, Manila.

CEYLON TEA IN AUSTRIA.

Read letter from Mr. G. A Marinitsch, Vienna, acknowledging receipt of copies of Mr. Ferguson's pamphlet on Pure Ceylon Tea and asking for a few more copies, if available.

"GOLDEN TIPS."

Read letter from Mr. H W. Cave sending a copy of his book entitled "Golden Tips." Resolved:—"That a copy of the book be sent to Mr. Wm. Mackenzie and Mr. J. H. Renton with a request to give the Committee their views as to the value of the book as an advertisement of Ceylon tea; (2) that the thanks of the Committee be conveyed to Mr. Cave for the presentation copy and for his offer of copies on special terms."

HE WANTED NO SUCH PATIENT.

"There now," said the doctor, "you go on taking this medicine till it is all used up. Then come back and let me have a look at you."

This was in December, 1896. The woman put the package in her pocket and went home. When the stuff had been consumed, as directed, she called again.

The specialist looked at her and made up his mind in a minute, "I will have nothing to do with you as a patient," he said. "It's no use. You are past help; you are worse than when you were here before; I can see the bones through your skin now. What I tell is the truth, and you will be wise not to deceive yourself with hopes that can only break down under you."

Rather hard, ugly talk; but from a commonsense point of view the doctor was right. For four years Mrs. Agnes Briggs, of Norwood Terrace, Paddington, near Brisbane, Queensland, had suffered what she calls "dreadful torment and pain" from dysentery. She tried everything advertised or recommended to cure it, without success.

She was an out-patient at the hospital for more than a twelvemonth, and an in-patient for two months. The medical men interested themselves in the case; they tried right and left for the true treatment, but were not able to lay hands on it. This seemed strange to her, as she did not realise how persistent, and frequently fatal, an ailment dysentery is. She had never read the reports of Army Surgeons on that point, and possibly you have not.

"During my illness," says Mrs. Briggs, "I ate but little; food did not nourish me, and I grew worse and worse, and thinner and thinner. For three years I did a trifle of work, and then I had to give in."

(At this crisis she consulted the specialist, whose frank opinion has been quoted.)

"From January to October, 1897," continues the lady, "I could do nothing whatever. Even my children were cared for by friends. My mother did all the housework, and, on seeing me, she often burst out crying. I was so emaciated and weak, she was sure I must die soon.

"And now comes my extraordinary cure—a cure so wonderful and unexpected that my friends insisted on calling it a miracle.

"A lady urged me to drop all other medicines and use Mother Seigel's Syrup only. Before finishing the first bottle I was better, and after taking it three months I was in splendid health, and have been ever since. People can hardly believe that the strong, healthy woman they see now is identical with the skeleton they knew and pitied two years ago."

Mrs. Agnes Briggs, Sept. 21st, 1899.

Mrs. Annie Mathams, of Prince Street, Latrobe Terrace, Paddington, Brisbane, Queensland, who commended the Syrup to Mrs. Briggs, vouches, in writing, to the truth of the above statement.

MARKET REPORT.

[*Per Mail advices of 28th December* 1900.]

COFFEE.

The London Commercial Record says:—The public market being closed very little of interest is passing on the spot. Brazil futures immediately after our last advanced ½d to 9d per cwt. on good American advices, but the improvement was short lived, the market going back to almost its previous level on lower cables from the Continent. Yesterday a further depreciation of 4½d per cwt. was submitted to, March Santos selling at 31s 4½d, and May at 31s 7½d per cwt.; closing rates are:—

London ...	Santos ...	March delivery	... 31s 4½d.
New York	... No. 7 Rio...	,,	... 5·65 cents.
Hamburg...	... Santos ...	,,	... 31 pf.
Havre ...	... Santos ...	,,	... 37¾ francs.

Imports, Deliveries and Stock of Coffee in London, are as follows:—

	Stock.		Imports.	
	1900.	1899.	1900.	1899.
Tons ..	14,790	14,704	35,176	45,994

	Home Consumption.		Export.	
	1900.	1899.	1900.	1899.
Tons ...	16,473	16,621	18,560	29,048

	Tons.
The preceding figures exhibit—	
In the Imports a decrease this year of ...	10,818
Home Consumption a decrease of	148
Export a decrease of	10,488
Stock a decrease of	86

Receipts in Rio and Santos.

Santos ...	5,323,000	4,558,000	3,738,000	4,392,000
Total...	6,953,000	6,642,000	5,493,000	7,098,000
Crop...	—	8,971,000	8,772,000	10,461,000

Rio Exchange $10\frac{1}{32}$d, previous day $9\frac{7}{8}$d.

HAVRE, *Dec.* 27.—Good average Santos December opened quiet at $37\frac{3}{4}$f. and closed barely steady at $37\frac{1}{4}$f., March opened at 38f. and closed at $37\frac{3}{4}$f., May opened at $38\frac{1}{4}$f. and closed at 38f., September opened at 39f. and closed at $38\frac{3}{4}$f.

HAMBURG, *Dec.* 27.—Good average Santos December opened quiet at $30\frac{1}{4}$pf. and closed dull at 30pf., March opened at $31\frac{1}{4}$pf. and closed at 31pf., May opened at $31\frac{1}{2}$pf. and closed at $31\frac{1}{2}$pf., September opened at 32pf. and closed at 32pf.

NEW YORK, *Dec.* 27.—Closing prices of No. 7 Rio were as follow:—

	Dec.	Jan.	Feb.	Mar.	April.
December 27...	5·45	5·45	5·55	5·65	5·70
December 26...	5·50	5·50	5·60	5·70	5·75

TEA.

The market remains closed, and only the smallest of contracts have passed during the week.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon and Java Tea Report, dated December 28th, 1900, says :—

Of the many lean years through which the Tea industry has recently passed, 1900 has proved the worst.

Heavy crops both in India and Ceylon resulted from the planting of considerable areas some few years ago, when Exchange was much below its present figure. Production has, in consequence, increased more rapidly than consumption, and occasioned a lower range of price. Poor Teas have been specially depressed, owing partially to the large proportion of this grade, and in a great measure to the additional duty placed upon Tea in March last, the 2d per lb. then added to the tax having proved a severe burden upon all low priced Tea.

Happily, the remarkable value obtainable has had the effect of attracting foreign markets to our Teas and occasioning a welcome expansion in this increasing trade, which absorbed about 82 million pounds of British grown Tea, against 69 millions in 1899.

PRODUCTION.—The total crop for export from India (*including Travancore*) is expected to reach about:—

	Lbs.		Lbs.	
	183,000,000	against ...	175,000,000	last year.
From Ceylon ...	142,000,000	,, ...	130,000,000	,,
Total ...	325,000,000	Total ...	305,000,000	

while the Consumption at home and abroad was about:—

Indian ...	170,000,000	against ...	164,000,000	last year.
Ceylon ...	140,000,000	,, ...	124,000,000	,,
Total ...	310,000,000	Total ...	288,000,000	
Surplus production	15,000,000	against ...	17,000,000	

Hence there is again an accumulation of stock on the year's working.

INCREASE IN DUTY.—The year 1900 will be memorable for the rise in the duty from 4d to 6d per lb. It is hard that an Industry which has already been heavily weighted by a rise in Exchange should have this additional burden placed upon it, especially when beverages like Cocoa and Coffee are only taxed to a slight extent. The effect has been very marked during the last few months in the fall which has taken place in the value of low grade Teas.

HOME CONSUMPTION does not appear to have increased during the year, but it is impossible to ascertain accurately from figures, owing to their disorganisation by very large duty payments just before the declaration of the Budget.

NEW MARKETS.—New markets have taken about lbs. 13,000,000 more than last year; a very satisfactory increase. This is doubtless in part due to recent low prices. The greatest expansion has been in Russia, due partly to the above mentioned cause, and probably also to the troubles in China. The Tea trade in the United States of America has lately been depressed, and consequently progress has not been as rapid as might have been wished. Australia continues to be the largest external consumer of our Teas.

WAREHOUSE CHARGES.—Some slight relief has been afforded the industry by a reduction in the Warehouse Charges, together with a slight modification in the system of Customs weighting.

INDIAN.—The quality of the crop has not been up to the average, except in parts of Assam and Darjeeling. Really fine Teas commanded high prices on account of their scarcity.

The regulation of sales was discontinued. Had it not been for the delay in bringing Teas to the warehouse, occasioned by the Lightermen's strike, auctions in October-November would probably have been sufficiently heavy to still further depress the market

The average price obtained for the Teas sold on garden account in London during the year was 7·74d per lb., against 8·75d per lb. in 1899. From the 1st June to the end of December it was 7·60d, against 8·49d per lb.

CEYLON.—The crop has been a heavy one, probably occasioned by the unusually favourable weather for flushing and the extensive use of manure. The quality from some estates has been very good; on the other hand there was a larger proportion of poor liquoring Teas. The average price for Teas sold in London on garden account was 7·20d, against 7·96d in 1899.

GREEN TEA.—In order to encourage the manufacture of Green Tea suitable for the American market, a bounty for its manufacture is being offered by India and Ceylon. Much relief might thus be afforded to the Tea industry, especially as for every pound of Green Tea manufactured, the production of Black Tea will be reduced by a similar amount.

COARSE PLUCKING.—If the planters could be induced to avoid coarse plucking, it would probably be much to their advantage, and result in higher quotations for the smaller crop.

JAVA.—The quality of many of these Teas is now very suitable for the London market, especially where they have been grown from Indian seed. 61,662 packages were sold in London, against 56,126 packages in 1899.

EXCHANGE.—Averaged $1/4\frac{13}{32}$ during 1900, against $1/4\frac{15}{32}$ in 1899.

COCOA.

A dull tone prevails, and business is practically *nil.*

PEPPER.

BLACK is very firm and slightly dearer, with moderate sales at $6\frac{15}{32}$d to $6\frac{1}{2}$d per lb. for Singapore March-May shipment, whilst buyers have paid $6\frac{1}{4}$d for spot "fair"

WHITE is quiet but steady. Singapore on the spot is worth $9\frac{1}{8}$d and for January-March shipment $9\frac{1}{4}$d, while Penang is quoted at $8\frac{7}{16}$d spot and $8\frac{5}{16}$d per lb. February-April (s.).

CINCHONA.

The auctions to be held at Amsterdam on January 10, 1901, will consist of 6,105 bales and 185 cases (weighing 551,266 kilos.) Java cinchona, consisting of 414,241 kilos. Ledgeriana, 85,008 kilos. Succirubra, 52,017 kilos. Hybrid.

QUININE.

The second-hand market closed dull on Friday at 1s $1\frac{1}{8}$d per oz., 1s $1\frac{3}{4}$d for March, and 1s 2d for May, and since then there has been no change.

PLANTING OPINION.

A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VI.] MADRAS, SATURDAY, JANUARY 26, 1901. [No. 4.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 1st proximo. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

Coorg.

POLLI BETTA, *22nd Jany.—Weather.*—This is, without exception, the most extraordinary season witnessed. Clouds are still hovering about, and the East wind is still conspicuously absent. There has been no bright, clear, cold weather and chapped hands, etc. It seems due to the above facts that the crop has been ripening-up so satisfactorily. The rain, already reported, has brought out a sprinkling of blossom in these parts; but out West of this (especially beyond the Kauveri river at Sidapur), the display is reported as being heavy comparatively. There has been some improvement in general health.

TEA—SUPPLY AND DEMAND.

THE fall in the value of Tea has caused much tribulation among planters and has induced them, Ceylon men in particular, to write lengthy epistles to the press, expressing opinions as to causes and remedies. Among these there is much that is of a purely ephemeral character, but some suggestions have been considered worthy of discussion. For our own part, we consider that Ceylon is on the verge of a precipice. We cannot say that it contemplates deserting a wise in favour of an unwise course, but it certainly has under consideration a policy, the acceptance of which would involve some neglect of a system that has worked fairly well in the past. The cry of over-production has been raised, and one result is that Ceylon tea-planters are discussing how the production of Tea is to be prevented from increasing, if indeed it cannot be actually reduced. Now, in the first place, a reduction in Ceylon would be useless if accompanied by a corresponding reduction in India. We might even go further and assert that the over-production problem could only be so dealt with as to bring about a permanent rise of values if uniformity of action were agreed upon by the chief producers, *viz.*, China, India, Ceylon and Japan. If any one of these holds away from the general agreement and sets itself to extend the cultivation of Tea, it may upset the policy of the rest, and hold prices down, or even bring about a further decline in values. Certainly, Ceylon working jointly with India—which is, we believe, what most of the Ceylon suggestions have in view—might work more effectively than Ceylon alone. Yet, despite all the endeavours that have been made to train the public taste, and to push British-grown teas into favour, we believe that the chief factor in influencing the consumer (by which we mean the average consumer) is cheapness of price, so long as it relates to some commodity not quite unworthy of being designated Tea. If this be the case, a reduction of output in India and China, if accompanied (as it might well be) by a corresponding increase in the output of China and Japan, would have no material strengthening effect upon the prices of even Indian and Ceylon descriptions alone.

Our contemporary, the *Times of Ceylon*, has made special mention of the following suggestions:—

(1) That 10 per cent. of the acreage in bearing be rested for two years. (Mr. Rosling's proposal).

(2) That Government be requested to enforce this by legislation. (Mr. Rutherford's proposal).

(3) That steps be taken to limit the output of each estate to, say, the average yield of the last three years.

[*1, 2, and 3 conditional on 80 per cent. supporting, and on India agreeing to take the same course.*]

(4) That Government be requested to sell no more land for opening up in tea.

(5) That Government be requested to prohibit any lands privately owned from being planted up in tea, where such work has not actually been commenced, this restriction, and any others, to be brought up in review three years hence. The first three, it will be seen, refer to joint action on the part of India and Ceylon. Our contemporary remarks:—"The equity of proposition 3 grows upon us. The chief responsibility for the state of affairs lies with those who have been greatly increasing their output per acre—those who of late years have gone in for wholesale extensions are partly responsible, but their new tea has been, and is, coming on

gradually—by 'high cultivation;' and such would have to forego more than those who have continued a normal output. It is the only proposal which we think would be tolerable, if it were by legislation." To us the suggestion appears not only absurd, but unfair. It would impose restraints upon improvements of systems of cultivation. At present, a particular planter may be able to produce tea of an equal quality to that of his competitors at a lower figure. By dint of mere scientific manuring, or by the favour of atmospheric conditions, or with the help of good fortune or "luck," he may have an advantage over his rivals, or the majority of them. Is it fair to ask him to relinquish this? We think not; and we hold also that there are insuperable objections to all the above schemes, so long as China and Japan cannot be induced to co-operate in him. The possibility of this is too remote to need discussion.

To our minds, neither planters nor Governments have a right to impose restrictions upon the output of Tea. Every planter is entitled to produce as much as he can at the lowest possible cost; any interference with this right would be an unjustifiable interference with the liberty of the subject, and even though planters who objected to it might be standing in their own light, their equitable and moral right to do so should not be withdrawn from them. The more natural and more proper remedy for the present condition of affairs lies in the development of demand or consumption. True, this may involve an increase of the very danger—over-production—that has been found to have such serious effects; but this cannot be helped. The Tea industry, like others, must adapt itself to the laws of competition. The "survival of the fittest," is a doctrine that holds good in the growth of agricultural products as well as in the growth of nations. Whether India decides to canvass jointly with Ceylon—whether South India elects to stand in with Northern India, or to push ahead separately—these are points of detail. The broad principle we lay down is that, while Government and planters, as a body, may help as much as they please to increase the consumption of tea, they have absolutely no justification for attempts to inteffere with the extent or the cost of its production on estates already opened. It seems to us that Indian planters cannot well urge upon Government what amounts to the fixing of the maximum production and aims at fixing the minimum cost of production of tea, after remonstrating, as they did, against the fixing of the sterling value of the rupee. They cannot blow hot in regard to one class of interference with their rights and cold as to another; or, if they do, they deprive their representations of force. What is required for the resuscitation of the Tea industry in India and Ceylon is (1) earnest efforts to increase the consumption of tea generally, and of Indian and Ceylon teas in particular; and (2) steadfast representations against the enormous impost that is, in effect, levied upon the industry by the maintenance of the rupee at an artificially inflated gold value.

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nicholson's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf people, unable to procure the Ear Drums, may have them free.

CINCHONA IN MYSORE.

The reader will probably smile at this headline, thinking that he is to see something after the style of the chapter on Snakes in Iceland, which read "There are no Snakes in Iceland." We have no such plagiarism in view, however, for there actually *is* cinchona in Mysore. That it is apparently not worth removing the bark from is quite another matter. Official statistics show the following figures for 1898-99 :—

		No. of Plants.		
		Mature.	Immature.	lbs. of bark.
Kadur	C. Succirubra ...	49,160	43,200	25
	,, var. Condaminia ...	9,840	4,500	...
Mysore	C. Succirubra ...	1,749	75	...
	,, Calisaya	...	...	..
	,, var. Condaminia ...	502	19	..
Hassan	... ,, ,, ,, ...	1,940	120	...
		63,191	47,914	

In 1894-95 there were 350 acres under cinchona in Mysore, in 1898-99 only 279; in 1894-95 there were 207,783 cinchona plants in permanent plantations in Mysore, only 111,105 in 1898-99; the quantity of bark collected had decreased from 160 lbs. in the former year to 25 lbs. in the latter. Can any Mysore planter oblige us with a historiette of the Rise (?) and Fall of the Cinchona Industry in the Mysore State? The above figures suggest that there is something to be told that is worth the telling: 279 acres, 111,105 plants and yield—25 lbs.!

U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

The British Tea Duty.

The Indian Tea Association (Calcutta) has addressed the Secretary to the Government of India, Department of Revenue and Agriculture, as follows, under date 9th instant :—

I am directed by the General Committee of the Indian Tea Association to address you on the subject of the recent enhancement of the British import duty upon tea, with a view to the Government of India urging the Chancellor of the Exchequer, through the Secretary of State, to reduce the duty to its former level of 4d. per pound of tea imported.

2. The general question of the relation of the import duty to the prosperity of the Indian tea industry has, during the last two or three years, received the serious consideration of the General Committee. That in ordinary circumstances the consumption of a commodity upon which a duty is levied tends to decline with the enhancement of the duty, and to advance with its reduction, is an economic law which applies with equal force to tea as to any other commodity. The whole history of the tea duty strikingly exemplifies the truth of the latter part of this proposition. Between 1815 and 1820 the duty was practically 4s. per pound—the highest rate which obtained during the nineteenth century. The average annual consumption per head of the population was 1 lb. 4 oz.—the lowest level reached during the century. From 1820 to 1864 the duty was gradually reduced from 4s. to 1s. 4d.; and during that period consumption increased from 1 lb. 4 oz. to 2 lbs. 8 oz. or 100 per cent. In 1865 the duty was further lowered to 6d., at which rate it remained until the 1st May 1890, when it was brought down to 4d. per pound.

Consumption has nearly doubled in the thirty-five years which have elapsed since 1865; for in that year it stood at 3 lbs. per head of the population, while it is now almost 6 lbs. per head. It is unfortunately true that since 1881 the price of tea in bond has been steadily declining; and the Committee quite recognise that that decline has materially aided the extension of consumption, because, like a reduction in the duty, it has lowered the price paid by the consumer. But even so, it is, they hold, indisputable that the reductions of duty which have been effected since the time when it stood at 4s. per pound, constitute one of the main causes of the great increase in consumption in the United Kingdom during the last half of the century. They hold further that any enhancement of the duty must have, and that the recent enchancement has had, the opposite effect of diminishing, or at least of checking this increase in, consumption. And it is because this diminution, or check, entails most serious consequences upon the Indian industry in its present state that they regard the enhancement with the gravest alarm.

3. It will be inferred from the foregoing that the Committee—looking at the matter from the point of view of the Indian tea producer—consider the import duty, at whatever rate it may be fixed, as a hindrance to the extension of the consumption of tea. Its adverse effect upon consumption is, they contend, in proportion to its rate; and they believe its gradual reduction, and ultimate abolition, would be of the greatest possible advantage to the Indian industry. In thus stating their views the Committee desire it to be understood that they are not overlooking the importance of indirect taxation as a means of raising revenue. Nor has it escaped them that the exceptional circumstances of the past year have rendered increased taxation imperative. The point they desire to urge is that, while as the Chancellor of the Exchequer observed in his Budget Statement, the population at large have not much ground of complaint against the increase, the burden of it really falls upon the producers of tea. It is true that the consumer pays a higher price by reason of the enhancement, but it is no less true that the producer, from the same cause, receives a lower price for his product. This must be, and is so, because the rise in the price to the consumer tends to diminish the demand, while there is no force at work tending to reduce the supply.

4. This brings the Committee to the chief reason which has induced them to seek the intervention of the Government of India in behalf of Indian tea growers. Not only is there no force working to reduce the supply of Indian tea to the markets of the United Kingdom; but, on the contrary, the quantity sent annually to London is increasing rapidly. The Committee have ventured, on more than one occasion recently, to bring the facts regarding the present position of the industry to the notice of Government. But the crisis through which tea, as a commercial product, is passing is so serious, and is moreover so intimately connected with the subject of this letter, that they feel no apology is necessary for again referring to it. They have already stated that the price of tea in bond has been declining—it might almost be said rapidly declining—since 1881. At that time the average price of Indian tea in London was about 1s. 5d. per pound; ten years afterwards it had fallen to 10½d.; while at the present time it is about 7d.; and low grade teas do not command more than 3½d., or even 3d. per pound. The duty in 1881 was 6d. per pound. It represented, therefore, a charge of rather more than 33⅓ per cent. on the average price in bond; while now it is equivalent to nearly 100 per cent. on the average price, and 150 to 200 per cent. on the price of common teas—an overwhelming addition to the cost of financing the trade. It will, the Committee think, be readily conceded that in asking for the reduction of such charges upon prices which are themselves—in the case of much medium and low quality tea,—actually below the cost of production, and which consequently must, if continued for any length of time, mean ruin to a number of tea concerns, they are making only a most reasonable and moderate demand.

5. In this connection the Committee would point out that from the 61 Tea-growing Companies which appear in the Calcutta Share Lists (Capital Rs.2,02,42,850) the average rate of dividend for 1899 was 3·92 per cent. Eliminating six companies which have been largely developed out of Revenue (Rs.17,00,000 Capital—dividend Rs.2,65,000 or 15·6 per cent.), so that the area planted is disproportionate to the Capital Account, there remain 55 companies with an aggregate Capital of Rs.1,85,42,850 on which the payments to Shareholders averaged 2·81 per cent. This unfavourable result will be seriously aggravated in the current season the price of tea both in the Calcutta and London markets having declined to the lowest point on record. The figures are :—

			Packages	Average per lb.
Calcutta Sales	1st May to 15th December,	1899	484,531	6 as. 0 p.
Ditto	Ditto ditto	1900	475,154	5 as. 6 p.
London Sales (on Growers' account).	1st June to 30th November,	1899	617 628	8·55d.
Ditto	Ditto ditto	1900	611,798	7·72d.

But the present depression is worse than these figures indicate, the current quotations for Pekoes and Pekoe Souchongs—which represent about 70 per cent. of the total production—being from 1¼d. to 2¼d. per lb. under the rates ruling a year ago, equal to a decline of 22 to 34 per cent. The average price of all Indian tea sold in Calcutta for the week ending, 15th December, 1900, was 4 annas 10 pies per lb., against 5 annas 10 pies in the same week in 1899; the corresponding figures of the London sales (week ending 19th December) being 6¾d. and 8⅛d.

6. Intimately associated with the question of low prices, is the advance, since the Mints were closed in 1893, in the sterling value of the rupee. It has just been stated that the supply of Indian tea to the London market is annually increasing. Production during the past five years has increased by as much as thirty per cent.; and this has been mainly due to large extensions of the cultivated area which were planned and undertaken when the rate of exchange with Europe was at a low level, and in the expectation that it would so remain. Had it so remained, a large number of tea concerns, which are not at present remunerative undertakings, would be yielding a return upon the capital invested in them. But the currency policy of the Government—although it may have proved of benefit to the country generally—has made it impossible for such concerns to pay dividends, without higher prices in London. To secure the latter, the diversion of Indian tea in increasing quantities to foreign countries is essential. The Committee have already pointed* out to Government the difficulties which they have had to face in connection with the raising of funds for promoting the sale of Indian tea outside Great Britain. They have also suggested the adoption of measures by which more ample funds can be

* (Letter No. 845-O., of 5th December, to the Government of Bengal—copy attached.)

provided; but even should those measures be successfully put into force, the difficulty of restoring prices in London to a remunerative level will be greatly enhanced if the present rate of duty be not reduced.

7. There is one further point to which the Committee respectfully venture to draw the attention of the Government of India. While, to a certain extent, they agree with the Chancellor of the Exchequer in thinking that that "very large class of the population who do not pay income-tax, who do not consume alcohol, and do not smoke" should contribute towards the expenses of the South African war, they do not consider it to be equitable that tea alone of the commodities used by that class of the people of England, should be singled out for an increase of duty. There are other commodities which appear to the Committee to be very lightly taxed when compared with tea. The duty on cocoa, for example, in whatever form imported, is not higher than 2½d. per pound; and on raw cocoa it does not exceed one penny—or one-sixth of the tea impost. The cocoa duty has remained stationary for many years, while the consumption of cocoa has rapidly increased. The quantity of raw cocoa entered for home consumption in 1879 was 10,111,526 lbs., and in 1898 it had risen to 32,087,084 lbs.—an increase of more than 200 per cent. in twenty years. The consumption of tea, on the other hand, has not increased by as much as fifty per cent. in the same period, the figures being about 160½ millions of lbs. in 1879, and 235½ millions in 1898. Although, no doubt, some of the raw imports are manufactured into chocolate, it is clear that, with such a rate of increase, cocoa is rapidly becoming, if it is not already, an important competitor with tea. And while the Committee do not suggest that the duty upon it should be raised to the level of that now charged upon tea, they certainly are most distinctly of opinion—as they believe are all interested in the tea industry—that the present great disparity should be removed, preferably by a substantial reduction of the tea duty, and by a moderate addition to that upon cocoa. In venturing to make such a suggestion the Committee do not disguise from themselves the fact that, if it were adopted, the amount—£1,800,000—which, it is estimated, will be raised annually by adding 2d. to the tea duty, might not be forthcoming. But the inequality is so patent that they think the attention of Sir Michael Hicks Beach should be very strongly drawn to it.

8. The Committee have now stated why they consider it to be imperatively necessary, if the cultivation and manufacture of tea are to continue to form one of the leading Indian industries, that everything should be done to extend, rather than to restrict, consumption in the United Kingdom and elsewhere. They have further shown why, in their opinion, the recent enhancement of the import duty will have the effect of restricting consumption in the United Kingdom; and they now venture to ask H. E. the Viceroy to press upon Her Majesty's Ministers the urgent necessity for the reduction of the duty to at least its former level. They trust His Excellency will see his way to take such action, and will lend to the movement all the weight of his influence and support.

9. In view of the fact that the new Budget Statement will be presented to the House of Commons in the course of a few months prompt measures are essential. The Committee, therefore, venture respectfully to suggest that, in the event of His Excellency being disposed to take action in the direction they have indicated, a telegram should be sent, as soon as possible, to the Home Government protesting against the enhancement, and pressing for a reduction of the duty to its former level.

[ACCOMPANIMENT.]

From the Secretary, Indian Tea Association, to the Secretary, Government of Bengal, Revenue Department.

CALCUTTA, *5th December*, 1900.

SIR,

I am directed by the General Committee of the Indian Tea Association to ask you to be good enough to draw the attention of H. H. the Leiutenant-Governor of Bengal to the necessity which exists for the imposition, upon Indian tea, of an export duty, similar to that which has been levied in Ceylon since 1892. That is to say, a duty the proceeds of which would be devoted to the work of pushing the sale of Indian tea in foreign markets.

2. Before referring to the reasons which, in their opinion, necessitate such a tax, the Committee propose briefly to state the origin, nature, and advantages of the Ceylon impost. The latter was instituted in 1892, by an Ordinance which provided for the collection by the Customs Officers of a duty of 10 cents per 100 lbs. of tea exported. It was primarily designed to provide the Ceylon Planters with funds for the adequate representation of their teas at the Chicago Exhibition of 1893. For that purpose it proved successful; so successful, in fact, that in 1894 it was converted by a further enactment into a permanent tax. The rate was raised from 10 cents to 20 cents per 100 lbs.; and it was decided that the proceeds should be "applied towards increasing the consumption of Ceylon tea in foreign lands."

Ordinance No. 15 of 1892. An ordinance to levy an export duty on tea.

Ordinance No. 4 of 1894. An ordinance to provide for the continuance of the export duty on tea levied under Ordinance No. 15 of 1892.

3. The amount raised by the Ceylon tax is, on the average but little short of 2½ lakhs of rupees yearly. In India—as is already known to H. H. the Lieutenant-Governor—a voluntary levy is in force. It was instituted in 1893, and has since been continued annually. But the subscribers to it do not represent more than 75 per cent. of the industry; and the some collected is somewhat less than half that raised by means of the Ceylon tax. The Indian industry, therefore, has only been able to make about half the progress that Ceylon has made in the direction of opening foreign markets. To North America alone has the Indian industry been able to devote serious attention. Ceylon, on the other hand, has made sustained and liberally supported efforts, not in America only, but in France, Germany, Russia, Austria-Hungary, Belgium, Holland, Sweden, Norway, South Africa, Australia and elsewhere. The net result—to take last year's figures—is that while Ceylon, with a production of 150 millions of pounds, sent about 37 millions or 29 per cent., to foreign countries, India, with the larger production of 175 millions, sent only about 32 millions, or 18 per cent., to markets other than those of Great Britain and Ireland.

4. Owing to the great increase in the production of Indian tea during recent years—the increase between 1895 and 1899 was 30 per cent.—the supply to the markets of the United Kingdom has been continuously in excess of the demand. The growth of the foreign demand has been altogether incommensurate with the increase in the quantity of tea yearly produced in excess of the needs of the United Kingdom; and millions of pounds not required in London have been able to find no other market during each of the last few years. The result has been that medium-quality tea, which forms the great bulk of the Indian product, has been continuously falling in price until at the present time much of it is being sold below the cost of production. In fact, prices generally have now fallen to so low a level that if tea growing is to continue to be a remunerative undertaking, comprehensive measures must be promptly taken to improve them.

5. It may be said that if Indian growers had taken the precaution to restrict their production, they would have provided themselves with a simple and efficient remedy for this evil. But in that connection it must not be forgotten that the recent rapid advance in production is mainly due to the large extensions, both in India and Ceylon, which were planned and undertaken when the rate of exchange with Europe was at a low level. The closing of the Indian Mints, and the subsequent rise in exchange to 1*s.* 4*d.*, had an adverse effect upon the tea industry; and many tea estates, which, with a low rate of exchange, would have been remunerative

undertakings, are not now dividend-earning. Moreover, any general diminution of Indian production would be of only doubtful advantage to growers, so long as the present rapid rate of increase is maintained by Ceylon. The result of any such diminution would only mean a transference of part of the trade to Ceylon growers, without any corresponding upward movement in prices.

6. The diminution of production in India, therefore, even if it were possible would not be likely to have a favourable effect upon prices The only really effective remedy for the present state of the industry is the institution of measures the operation of which will ensure the diversion of increasing quantities of tea to foreign countries. In other words, to follow the lead of Ceylon, and to put into force a scheme by which sufficient funds can be raised to extend the efforts that have been made in America, during the past seven years, to other countries where there is a likelihood of large quantities of tea being consumed. Past experience in India has shown that it is not possible, by means of a voluntary levy, to collect enough money to carry on work upon an extensive scale; while, on the other hand, the case of Ceylon proves conclusively that it is not at all a difficult matter to raise ample funds by an export tax. Such a tax, had it been in force in India last year at a rate of only half a pie per pound of tea exported, would have yielded about 4½ lakhs of rupees, or four times the amount of the voluntary collection. The Committee have every reason to believe that its imposition by Government would be welcomed by a very large majority of tea proprietors. To secure unanimity among proprietors without the intervention of Government has been found to be impossible; not, as the Committee believe, because of any antagonism to the object to be attained, but because no organisation sufficiently comprehensive to ensure subscriptions being paid by all proprietors can be brought into existence without State aid.

7. The Committee, therefore, now desire to ask whether, in the opinion of His Honour Sir John Woodburn, the Government of India might be disposed to consider a proposal to institute a tax, if a large majority of tea proprietors expressed themselves in favour of it. It is true that, in view of the number of ports in India, the collection of the impost would present greater difficulties than in Ceylon. But it seems to the Committee that if instructions were issued to every Collector of Sea Customs in India, similar to those governing the collection of other export duties, those difficulties would be readily overcome. In Ceylon no charge for collection is made by the Government, the whole of the proceeds of the tax being handed over to a joint Committee—the "Thirty" Committee—of the Ceylon Chamber of the Commerce, and the Ceylon Planters' Association. The Government, however, retain the right to see that the funds are not distributed otherwise than in a manner likely to be beneficial to the industry.

8. In conclusion, the Committee would beg to be allowed to press the great importance of the proposal upon the attention of His Honor; and they would further venture to express a hope that he will see his way to submit it for the consideration H. E. the Viceroy, and in so doing to lend to it the weight of his influence and support. It is a proposal which affects the tea industry only; its adoption can have no possible adverse influence upon any other trade, or industry, or upon any community. The tax will be paid by tea-growers, and its proceeds will be expended by them; and the assistance of the State is only sought because it is not possible to devise any other plan by which funds can be collected from the whole industry.

9. Copies of the two Ceylon Ordinances, referred to above, are attached for information.

I have the honor to be,
Sir,
Your most obedient servant,
W. PARSONS,
Secretary.

ORDINANCE ENACTED BY THE GOVERNOR OF CEYLON WITH THE ADVICE AND CONSENT OF THE LEGISLATIVE COUNCIL THEREOF.

No. 15—1892.

An Ordinance to levy on Export Duty on Tea.

A. E. HAVELOCK.

Preamble. Whereas, in order to provide towards the cost of the adequate representation of this Colony at the World's Colombian Exposition at Chicago in 1893, it is expedient to levy a duty on all tea of the produce of this Island exported therefrom: Be it therefore enacted by the Governor of Ceylon, by and with the advice and consent of the Legislative Council thereof, as follows:—

Export duty to be levied of 10 cents per 100 lbs. of tea.

1. (1) There shall be raised, levied, and paid upon all tea of the produce of this Island exported beyond seas a duty of ten cents per one hundred pounds, and such duty shall be independent of, and in addition to, any duty which may be imposed under the provisions of "The Medical Wants Ordinance, 1880, Amendment Ordinance, 1882."

(2). The duty under this Ordinance shall be levied at the Customs on the entry for exportation of tea, and shall be payable to, and shall be collected and received by, the proper officers of the Customs Department, and the payment thereof shall be enforced under the provisions of the Ordinance No. 17 of 1869, intituled "An Ordinance for the general regulation of Customs in the Island of Ceylon."

Commencement and duration.

2. This Ordinance shall come into operation on the first day of January, one thousand eight hundred and ninety-three, and shall cease to be in force from and after such time as the Governor in Executive Council shall appoint by Proclamation published in the *Government Gazette.*

Passed in Council the Twenty-sixth day of October, One thousand Eight hundred and Ninety.

H. L. CRAWFORD,
Clerk to the Council.

Assented to by His Excellency the Governor. the Second day of November, One thousand Eight hundred and Ninety-two.

E. NOEL WALKER,
Colonial Secretary

ORDINANCE ENACTED BY THE GOVERNOR OF CEYLON WITH THE ADVICE AND CONSENT OF THE LEGISLATIVE COUNCIL THEREOF.

No. 4 OF 1894.

An Ordinance to provide for the continuance of the Export Duty on Tea levied under Ordinance No. 15 of 1892.

A. E. HAVELOCK.

Preamble. Whereas it is expedient to provide for the continuance of the export duty on tea levied under the Ordinance No. 15 of 1892, after the expenses of the World's Columbian Exposition of Chicago shall have been paid and discharged, in order that the proceeds of such duty may be devoted to increasing the consumption of Ceylon tea in foreign lands: Be it therefore enacted by the Governor of Ceylon, by and with the advice and consent of the Legislative Council thereof, as follows:—

Commencement of levy of export duty, and rate of duty.

1. So soon after the Ordinance No. 15 of 1892, intituled "An Ordinance to levy an Export Duty on Tea," shall have ceased to be in force, there shall be raised, levied, and paid upon all tea of the produce of this Island exported beyond seas a duty not exceeding 20 cents per one hundred pounds, the rate leviable to be determined by the Governor in Executive Council from time to time, upon consideration of such recommendations as may be made by the Joint Committee appointed by the Planters' Association of Ceylon on the 15th of June, 1894, and by the Chamber of Commerce on the 18th June, 1894, or the successors in office of such Committee, to administer the funds raised under this Ordinance, and such duty shall be independent of, and in addition to, any duty which may be imposed under the provisions of "The Medical Wants Ordinance, 1880, Amendment Ordinance, 1882."

Levy of export duty to be enforced under Ordinance No. 17 of 1869.

2. The duty under this Ordinance shall be levied at the Customs on the entry for exportation of tea, and shall be payable to, and shall be collected and received by, the proper officers of the Customs Department, and the payment thereof shall be enforced under the provisions of the Ordinance No. 17 of 1869, intituled "An Ordinance for the general regulation of Customs in the Island of Ceylon."

Proceeds of duty how to be applied.

3. The proceeds of the levy hereby enacted shall be applied towards increasing the consumption of Ceylon tea in foreign lands in such manner as may from time to time be desired and determined by the Joint Committee appointed for the purpose by the Planters' Association of Ceylon on the 15th of June, 1894, and by the Ceylon Chamber of Commerce on the 18th of June, 1894, or the successors in office of such Committee, provided that

such manner of application of the proceeds of the said levy be subject to the approval of the Governor in Executive Council.

4. This Ordinance shall cease to be in force from and after such time as the Governor in Executive Council shall appoint by Proclamation to be published in the *Government Gazette*.

Duration of the Ordinance.

Passed in Council the Twenty-ninth day of August, One thousand Eight hundred and Ninety-four.

H. WHITE,
Acting Clerk to the Council.

Assented to by His Excellency the Governor, the Twenty-ninth day of August, One thousand Eight hundred and Ninety-four.

E. NOEL WALKER,
Colonial Secretary.

Bounty on Green Teas.

The information contained in the following correspondence is of general interest to tea planters in Southern India :—

From the Secretary, Indian Tea Association (Calcutta), to the Secretary, U. P. A. S. I.

CALCUTTA, 14*th January*, 1901.

Copy of letter, No. 31-O, of 14th January, from the General Committee to Mr. Drummond Deane, Stagbrook, Peermaad, Travancore.

"With reference to previous correspondence ending with my No. 633-O, of 22nd September, 1900, I am directed to enclose for your information a copy of the marginally noted letter upon the subject of this bounty.

Yours faithfully,
(Signed.) H. M. HAYWOOD,
Assistant Secretary.

[INCLOSURE.]

No. 31-O.

Indian Tea Association,
Royal Exchange Buildings,
CALCUTTA, 14*th January*, 1901.

H. DRUMMOND DEANE, Esq.,
Stagbrook, Peermaad,
Travancore, S. India.

DEAR SIR,

The General Committee have noticed in the current issue of 'Indian Gardening and Planting' a letter from you, in the course of which the following remarks are made upon the subject of this bounty, *viz.* :—

'We are shamefully treated I consider, in that owing to red tape rules of the I. P. A. we are in practice debarred from getting 'the Grant in-aid.' Theoretically we can do so by sending samples to Calcutta from our Shipping agents at Cochin, but we are told that the teas must *not be shipped* until the samples have been reported on and results made known, otherwise we lose the grant; this would mean a delay of three weeks at least and if a steamer was missed during the interval, perhaps seven or eight weeks.'

'Common sense, one would think, would suggest that, the samples having been drawn and despatched to Calcutta by the Cochin agents the teas might be allowed to depart by first steamer, the Grant-in-aid being sent to the shippers if the teas passed the standard.'

The object of the Committee, in making this ruling was to prevent shippers despatching the teas immediately after drawing the samples, in the expectation that the bounty would be paid irrespective of the expert's report. There is no objection, so far as the Committee are concerned, to the method of procedure described in the second para. of your remarks above quoted. That is to say the shipper, after drawing the samples, is at liberty to send away the teas at his own risk. If he does so, and if the samples are passed by the experts, the bounty will be paid; but if the samples are not passed, the bounty will not be paid. The Committee much regret that their letter, dated 22nd September last, to Mr. Ormerod, the Secretary of the United Planters' Association, Southern India, upon which your remarks are evidently based, has been misinterpreted; and should you care to claim the bounty on any of your teas they will be glad to receive samples for submission to their experts.

NOTES

The Brazilian Coffee Crop.

London brokers still estimate the current crop of Brazil Coffee at fully 9,500,000 bags.

Colombo Tea Sale.

At the public sale of tea at Colombo on the 16th instant about 17,360 packages = 1,355,243 lbs. were offered, of which about 12,081 packages = 1,009,311 lbs. were sold.

Calcutta Tea Exports.

The total amount of tea exported from Calcutta, from 1st April to 31st December, 1900, was 161,674,115 lbs.; while the quantity exported from Ceylon, from 1st January to 17th December last, was 139,270,495 lbs.

Amsterdam Bark Market.

The main catalogue for the Amsterdam bark auctions, to be held on Thursday, January 10th, shows that 7,487 packages would be offered containing 657,316 kilogrammes (about 1,446,006 lbs.).

Thibet.

The Indian Tea Association has decided to apportion a small sum of money for the purpose of giving effect to a suggestion made by the Government of Bengal that some of the Thibetan traders in wool should be asked to take consignments of Indian tea into Thibet.

The American Tea Duty.

A member of the Committee on Ways and Means of the House of Representatives writes as follows :—"I think it is due to the tea trade to know that there is no chance for any reduction of the duty on tea during this session of Congress, even to take effect a year hence."

Java Cinchona.

The shipments of Java Cinchona for the month of December were 1,090,900 Amsterdam lbs. compared with 626,000 Amsterdam lbs. in December 1899, and 1,018,000 Amsterdam lbs. in 1898, the total for the year being 10,845,300 lbs., contrasted with 11,390,800 and 11,133,000 Amsterdam lbs. in the two previous years.

Brazilian Coffee Statistics.

The Government of São Paulo has given instructions for the organisation of thorough statistics relating to the coffee industry. The details will comprehend the area of each separate plantation, number of trees, their age, yield, etc. With such a basis to work upon, forecasts of coming crops would be greatly facilitated.

The British Tea Duty.

The Indian Tea Association has addressed the Government of India on the subject of the recent enhancement of the British import duty on tea, with a view to urging the Chancellor of the Exchequer, through the Secretary of State, to reduce the duty to its former level of 4d. per pound. A copy of the letter is given in our U. P. A. S. I. section.

Prospects of Coffee.

The *Produce Markets Review* of 29th ultimo observes :—No fresh news of the next crop has been received, and, as all accounts still

oint to a large out-turn, there is a strong feeling against ny material rise being likely to last. Beyond the small busiess that has been done in the terminal market very little has aken place, and until the public sales re-commence on Janury 8, 1901, it is unlikely that there will be much change.

The Ceylon Tea Crop. A planter writes to the *Ceylon Observer* :—"I hear a well-known V. A. (the apostle of large yields) is giving the managers of estates, of which he is V. A., instructions to pluck finer ; and on one estate I passed through the other day, such instruction means at any rate 20 per cent. in 1901 less than the yield of 1900. So Messrs. Forbes & Walker are quite right to lead the readers of their circular to believe that the output of 1901 will be 6,000,000 lbs. less than 1900 in Ceylon."

A large Cargo of Coffee. Last week, says the *American Grocer* of the 19th ultimo, the steamer *Rossetti* arrived at this port with 126,000 bags of coffee from the port of Santos. That single cargo is larger than the total exports of coffee from all Brazil in 1821, about one-half the total exports in 1826, one-third those in 1835, and one-tenth the total in 1844. Quite as notable as the increase of production has been the increase in the size of cargoes brought by a single vessel. Over one-half the *Rossetti's* cargo, or 73,000 bags, was for W. H. Crossman & Brother.

Tea in Canada. "Busy ? Well I should think so," said Mr. Larkin, of the "Salada" Tea Co. to a representative of the *Canadian Grocer*. "We have never yet experienced a week in December that was even two-thirds as large as every week we have had so far in this December. We started in on Monday morning of this week with a full week's work ahead of us. Of course, the green Ceylon teas are accountable for this to some extent, as they are taking like 'wild-fire.' There is a great future before them, not only in Canada but in the United States also."

Currency. The Hon'ble Mr. Buckingham has directed the attention of the Bengal Chamber of Commerce to a "Notice" issued by the Treasury Office of Sibsagar, stating that "in future on receiving payment of Rs.200 and above, half of the amount will have to be taken in gold and currency notes, and the other half in silver and copper." Government currency notes and gold, he says, are not of the slightest value to the people in Assam, as it is impossible to pay coolies in gold, and such notes as are required can be got by post from Calcutta, and he desires the Chamber to urge the Government of India to substitute rupees for the gold and notes in the Assam Treasuries.

The London Tea Market. Messrs. Gow, Wilson & Stanton cable, dated 17th instant, to Colombo, reports that the market generally, as well as for medium liquoring pekoes and broken pekoes and for common pekoes and broken pekoes, is steady. The price of fair liquoring Ceylon Pekoe Souchong is 5d. and the average price of Ceylon tea sold on garden account this week was 6½d. (both same as last week)—as against 6¾d. and 7¾d., respectively, in the corresponding week last year. *Reuter* reports that common qualities of Ceylon tea are steady ; others firm : 30,000 packages of Ceylon tea were offered for sale, of which 28,000 were disposed of ; while of the 55,000 packages of Indian tea offered, 50,000 found purchasers.

Calcutta Tea Sale. We have again to report a better tone at the weekly tea auctions held on the 19th instant, possibly, to some extent, the reflection of the better enquiry for the article reported from London. Buyers, however, showed some disposition to secure, but at the same time paid most attention to teas possessing fair to good cup, which were not in great supply, and also to buy ordinary tea with black leaf. Though, at this late period of the season the supply is, as customary, somewhat limited, any teas possessing either of these characteristics realized higher rates than at closing last week. Ordinary brownish to reddish sorts sold steadily at only purveyor's prices, the teas most difficult to move being very red slacky ones.

Rubbishy Tea. "The *Grocers' Gazette*, of the 22nd ultimo, has an editorial dealing with the complaints which have recently been made about the rubbishy tea put up for sale in Mincing Lane, and urges that the trade should steadfastly refuse to buy inferior tea, no matter how low the price—that they should act on the principle that whatever is nasty is dear at any money. The reputation of tea, as a pleasant and wholesome beverage, has, by these recent importations of rubbish, says our contemporary, been placed in jeopardy with the public, and it behoves all concerned to do their utmost to save the trade from this danger, and to raise and maintain the standard of quality. In the *Gazette's* weekly tea report the matter is also referred to, it being added "a real censor is certainly wanted at the Custom House just now."

State Quinine in Italy. The Italian Chamber of Deputies has accepted the Bill, to which we recently alluded, making the sale of quinine a State monopoly. It will be sold by pharmacists and by all sellers of other State monopolies (tobacco and salt), provided they are not within 500 metres of the nearest pharmacy. It will be put up in tablets of 20 centigrammes each, ten tablets in an air-tight tube, and sold at the rate of 40 centesimi per tube for the hydrochloride, and 32 centesimi for the sulphate. The profit accruing from the sale will be devoted to devising means for the prevention of malaria. A law is also under consideration to compel all employers in malarial districts to provide the latest remedies for curing it, and to give the necessary medicaments to their workmen, free of charge. They must also see that proper dwelling-places and sick-wards are provided, and for this they will get loans at low interest from the public treasury and a reduction in taxes.

Cinchona Cultivation. Prof. Verne, of Grenoble, in the course of an interesting report on a scientific mission to British India and Java, says he finds the Java method of cultivation in advance of the British Indian plan, both as regards the cultivation of the bark and the manufacture of quinine. The report concludes that *Ledgeriana moens* is most suitable for cultivation, that *Succirubra* should be limited, and other species abandoned, and that if the trees are not barked till they are ten or twelve years old it not only ensures the preservation of the plantations, but a bark rich in quinine. Stress is also laid on the necessity of establishing quinine factories in the country where the cinchonas grow, so that small pieces of bark which would otherwise be wasted

can be advantageously utilised. The cultivation of cinchona, the report finishes by saying, is only suited for tropical and subtropical countries, a warning perhaps to the French Government not to be reckless in regard to the French colonies. The report appears in the *Jour. Phar. et Chem.*

Tea in the Caucasus.

The woes of the planters of Ceylon are, says the *Times of India*, as naught when compared with the tribulations of the cultivators of tea in the Trans-Caucasus. Tea can only be cultivated at a profit where labour is plentiful and cheap; and unskilled labour can only be obtained south of the Caucasus at wages varying from 1s. 6d. to 2s, per day. Even at these rates, labourers are scarce. Russian capitalists are, therefore, beginning to look askance at the appeals made to them to sink their money in tea plantations in this region. The firm of Popoffs, of Moscow, has tried the experiment for eight years. It has three extensive tea plantations near Batoum, and has also laid out a considerable sum upon a tea factory. According to Mr. Consul Stevens, the firm is about to sell its estates, being unable to cultivate them at a profit. The tea produced is not of a high grade, and is said to have an astringent taste; but experts declare that with scientific handling it might be materially improved. The difficulty lies in the cost and scarcity of the labour supply. For this reason, Russian tea is not likely to compete in the markets of the world for a good many years to come.

Care of Coffee Beans.

According to Mr. C. J. Blanke, the care of coffee, from the time it is harvested to the time it is ready for the table, is a very important matter for a good cup of coffee. A coffee berry is sensitive, especially so after it is roasted; still more so after it is ground. For this reason, a coffee after it is once roasted and put in a can to go to the consumer's kitchen just the way it comes from the roaster, is at once improved in quality. The air-tight tin receptacle preserves the rich, delicious aroma and flavor. as well as preventing the contamination of foreign matter. The cost of the can is more than made up in the preservation in quality and strength. The bag of coffee that has gone to the roaster for roasting by the old-time retail grocers and taken back to his store in a sack, has deteriorated in value 25 per cent. compared with that same coffee if roasted and put in a can. The coffee put in a dirty sack is subject to dust and dirt, as well as foreign odors. I have always advocated coffee to go to the consumer in tin cans; if not to go to the consumer in tin cans, to go to the retailer's store in tin cans.

Rubber in Assam.

The Charduar rubber plantation in Assam yielded last year 4,502 lbs. of clean rubber, 4,280 lbs. of which were sold in London at the price of 3s. 7d. per lb., and the Agents reported that it was the finest rubber ever sent from Assam and that if it could be delivered in larger quantities and with regularity it would realise a price still nearer to the rate paid for fine Para rubber. The year's working of the plantations resulted in a profit of nearly Rs.7,000, and as the present tappings have only been in the nature of experiments there appears to be a prosperous future before the rubber industry of Assam. The outturn of rubber other than the yield from the Charduar plantations also increased to 5,502 maunds—a considerable increase on the outturn of the previous year. This was due to the opening of the Manipur forests, which were hitherto closed to rubber exploitation, and to an increased outturn from the Lakhimpur district, the demand for rubber on the Calcutta market being very great, and partly to stock accumulating owing to the disturbed state of the Mishmi country.

The Prevention of Plant Diseases in Ceylon.

The *Ceylon Government Gazette* announces that it is proposed to introduce an ordinance, which may be cited as "the Insect Pest and Quarantine Ordinance," the object of which is to make provision for preventing the introduction and spread of insect or fungus pests or plant diseases by giving power to the Governor to make regulations for "prohibiting the importation into this Island from places beyond sea of plants; for prohibiting the landing of plants from vessels or boats, either absolutely or conditionally; and for cleansing or disinfecting by the consignee in the manner prescribed by and to the satisfaction of the Director, Royal Botanical Gardens, and, if expedient, destroying, without compensation, all plants or the packages, cases, pots, or covering in which they may be packed which shall be found or suspected to be infected with any insect or fungus or plant disease." Any person guilty of an offence against this ordinance, it is proposed shall be liable on conviction before a police magistrate to imprisonment of either description for a term not exceeding six months or to a fine not exceeding one thousaud rupees, or to both.

Fertilizers in 1900.

A Home firm reports:—Fertilisers generally have been steady throughout the year. Nitrate of soda developed unexpected strength in February, but subsequently sagged away, until re-stimulated by reports as to the formation of a powerful combination on the coast; since then it has just about held its own. Sulphate of ammonia has been subjected to fluctuations, though not of so violent a nature as in some past years. Early on there was a moderate rally in sympathy with nitrate of soda, followed however, by a sharp decline, owing to the lateness of the season, prices reaching "bottom" in the beginning of October. A reaction then took place, followed by a hardening market, which has since continued with very little interruption. Stocks are in small compass, and prospects favor a further improvement in values. Dried blood and superphosphates show scarcely any change, though the former has hardened slightly of late. Sulphate of copper has been controlled to some extent by the Syndicate of Manufacturers, but at times there has been a very marked difference between official quotations and those of re-sellers. Fluctuations have been caused by the vagaries of the metal market, but prices are again in the neighbourhood of figures current twelve months ago.

LETTERS TO THE EDITOR.

"FOXY COFFEE."

DEAR SIR,—In reply to Mr. Percy Tipping's letter, in your issue of the 5th instant, I should put "Foxy Coffee" down to a great percentage of half-ripe cherry found invariably in the first pickings of the season which, when pulped and placed in the fermenting vats, does not get a healthy fermentation on account of the "Cherry," cherry being immatured. I would be pleased to know if any "planters" agree with me.

F. REAY.

GENERAL ARTICLES.

GROCERS' COFFEE SALES.

The Philadelphia Grocers' Review gives the following account of an address given at a meeting of the Retail Grocers' Association by a Mr. Quinn, on the subject of increasing coffee sales:

"In commencing he stated there were

FOUR ARTICLES

that every grocer who wished to build up a good business should pay particular attention to, *viz.*: Coffee, tea, flour and butter. Coffee especially was a thing that people would travel a great distance to obtain good. Such being the case it would pay every grocer to make an especial study of his coffee trade. To do this it is necessary that the grocer himself should know

HOW TO MAKE COFFEE

properly so as to be able to speak with authority on the subject. Not only about coffee, but about everything else in his line of business, he should be wide awake and willing to learn. As a general rule the man who knows it all, generally knows it all wrong.

"As it is impossible to build up a trade on poor coffee it is necessary the grocer should have

GOOD COFFEE TO BEGIN WITH.

But this is not all. Seven out of ten of the complaints the grocer receives about his coffee comes from its not being made properly and not from any fault of the bean. This is shown when the customer comes and complains about the coffee she got Friday saying that which she bought Tuesday was all right, when both are part of the same roast. Which shows that it is just as necessary that

THE CUSTOMER SHOULD KNOW

how to use the coffee properly as it is that the grocer knows he has sold good coffee; and that he also knows how to make a good cup of it himself. How shall he do when someone complains to him? It is a case of keeping a customer or losing one. Which shall it be?

"It is here that his knowing how to make it himself will stand him in good stead. First of all he should ask the complaining customer a question or two and find out the cause of complaint. Sometimes they will say that the

COFFEE HAD A BURNT TASTE.

This, instead of being caused by poor roasting, is oftener caused by people putting the coffee in the bottom of the pot and letting it sit on a hot stove, where it will get as thoroughly burnt and spoiled as any roaster could do it in roasting it. Boiling coffee also spoils it, as the caffeine and oil which contains all the flavor is thus lost and an excessive amount of caffeine is extracted. Boiled coffee is not fit to drink.

THE PROPER WAY.

"The proper way to make coffee is to pour boiling water on it and let it stand five minutes, at the end of which time all the flavor in it has been extracted. Mr. Quinn stated that at his place of business he tests his coffee right before his customers, as demonstrated merit is something they cannot get away from. After tasting a certain kind of coffee, they will know it is their own fault if it is not as good when made at home. He had his testing apparatus with him, and proceeded to give those present a demontaration. Some years ago, to keep coffee good after making it, it was necessary to have an expensive coffee urn; now,

THIS IS DONE AWAY WITH

by a simple filter bag, which will fit the inside of any coffee pot. Under the old way of making coffee, unless it was used immediately it was made, the coffee would spoil by standing. By using a filter bag, however, the coffee may be left standing for hours and will still be good. First

HAVE BOILING HOT WATER,

then put your dry coffee in the filter bag (Mr. Quinn allowed 6 oz. dry coffee to make 4 qts. liquid, which is less than the average housekeeper uses, to obtain poorer results), and pour the boiling water through it into the pot. The coffee can be made stronger by repeating the operation and repouring the coffee through the filter bag.

PULVERIZED COFFEE

is not so good to use as the ground coffee, as it cakes and does not allow the water to circulate freely through it. Remove filter bag with exhausted coffee from the pot, as nothing of flavor remains in it, and your coffee will be as good three or four hours after as when first made. In pouring the coffee into cups, always put the cream in first, as the hot coffee scalds it.

"Mr. Quinn made four quarts of coffee in exactly four minutes in the manner just stated. The coffee he used he retails at 25c. per lb., and those who were fortunate enough to get a cup said it was excellent. His testing outfit consisted of a four-quart agate pot (coffee made in metal pots turns black from the action of the tannin on the metal), a dozen cups and saucers, the filter bag and hot water. The outfit could be

BOUGHT FOR A FEW DOLLARS,

yet Mr. Quinn says by using it he has sold as much as 350 lb. of one kind of coffee in 10 days of work, without other advertising. He also sells, to those customers who want them, filter bags like he uses in demonstrating, so as they will have at their disposal the means of making good coffee.

"He had a number of these bags for any of the grocers who wanted them, and there was a grand rush towards the platform by those present to obtain them."

TOBACCO AND NICOTINE AS INSECTICIDES.

Some interesting particulars as to the use of tobacco and nicotine for insecticidal purposes have been given in the course of a series of articles in *L'Economiste d' Orient*. Tobacco juice produced under State control has long, it is said, been employed for such purposes. The Excise has sold for some years in the retail shops and warehouses tins of a new kind of juice, called "jus riche," which contains more nicotine than the old juice sold, and which has the special advantage of presenting a constant standard (100 grammes to the litre). This new liquid was chiefly intended for the treatment of sheep scab, for which it has given the best results, but it has been extended to other uses. To economise and facilitate its action on plants, other ingredients are added, the following being a formula adopted for the spraying of plants:—

"Jus riche"	10 ccs.
Black soap	10 grammes.
Commercial carbonate of soda	2 "
Wood naphtha	10 ccs.
Water	1 litre.

This preparation is said to kill plant-lice (*pucerons*), caterpillars, etc.; the soap increases the adhesiveness, and the spirit, though not necessary, it is stated, increases the action. The Government also sells solutions of sulphate of nicotine (10 per cent. strength). Of this, 10 ccs. are taken and diluted with water to make one litre, and the addition of soap and carbonate of soda is recommended in this case also. In some of the public conservatories the tobacco juice is vapourised by plunging red-hot iron bars into the juice, which gives a dense cloud that reaches all parts of the plant and condenses on them.

ENTOMOLOGY.

We recently announced in our columns, says the *Englishman*, that Mr. Lionel deNiceville, F.E.S., F.L.S., C.M.Z.S., has been nominated to the post of Entomologist to the present staff of the Imperial Museum in Calcutta. Previously to this we published certain correspondence that had passed between the Calcutta Chamber of Commerce and the Government of India on the importance of having a State Entomologist for India. The necessity has been admitted by the Government and by the Secretary of State for India, with the satisfactory result noted above. Quite recently Mr. E. Ernest Green was appointed Government Entomologist to Ceylon. Every Colony in Australia has its own separate officer engaged in inquiring into the life-history of noxious insects and insects of economic importance; so have Tasmania, New Zealand, the Cape Colony, and Canada; while the United States of America has at least fifty different experimental stations, one in almost every State of the Union, and in some more than one, in which trained entomologists are engaged in practical work. Great Britain also has an entomologist, though only an honorary one, in the well-known person of Miss Eleanor A. Ormerod, who has done invaluable work as regards the insects which affect the crops, fruits, and

domestic animals throughout the country for a great number of years From this it will be seen that India is only falling into line with the rest of the English-speaking race in employing a State Entomologist. It is a little remarkable in this connection that no foreign country has seen the necessity of employing anyone to study the insect-pests that ravage the crops of all countries, and suggest remedies for them.

In appointing Mr. deNiceville to the new post, the Government of India expresses the hope that the Trustees of the Indian Museum will take steps to make his services freely available to Local Governments, to the Agricultural and Forest Departments, and to the public, in the matter of economic entomology; that they will require him to regard research in this field as his primary, if not sole, work; and that with this object they will set him free to travel for at least five or six months in the year. The Government of India, in consenting to add an Entomologist to the present gazetted staff of the Museum to assist the agricultural interests of India, by means of entomological research, trusts that Mr. deNiceville will strictly subordinate his special studies to this important end, and that his annual programme of work will be arranged accordingly, also that the Trustees will continue to be responsible for the annual course of lectures in entomology at the Forest School at Dehra, and that it is thought that this duty, if assigned by them to Mr. deNiceville, will not make excessive demands on his time, and that it may result in the establishment of useful relations between him and the officers of the Forest Department. On the other hand, it is left open to the Trustees to make other arrangements if they think fit. We feel sure that agriculturists, planters, fruit-growers, and everyone in India who, directly or indirectly, derives a living from the soil—and nine-tenths of the population of India is agricultural—will hail with satisfaction the news that Mr. deNiceville has taken up his new appointment, and that his services are immediately available. Correspondence should be addressed direct to him at the Indian Museum, Calcutta, regarding all matters relating to economic insects. We look forward with confidence to seeing the "Indian Museum Notes," which is a publication solely devoted to Economic Entomology, greatly increasing in bulk and usefulness under Mr. deNiceville's editorship.

CONTINENTAL MARKETS FOR INDIAN TEA.

THE BLENDING METHOD ADVOCATED.

The following is a copy of a letter which has been addressed to the Editor of the *Home and Colonial Mail*, by "C. B." :—

A good deal of interest attaches to the recent report by Mr. Harrington on "The Position and Prospects of the Continental Markets for Indian Tea." The real hope for the future of Indian tea lies in those markets. I have been a planter in India for many years, and have watched with much interest the gradual development of the market for our teas in England itself. One thing which has all along struck me forcibly is that our Indian teas cannot force any market by a direct frontal attack. In England we had from the first a great deal in our favour, from the mere fact that Indian tea is grown by our own countrymen and with our own capital, but for all that it took many years to educate people up to the fact that the Indian article was better than the China. People now fully acknowledge that it was only by *blending* Indians with Chinas that the market was captured at all; so that until about eight or ten years ago it was practically impossible to buy pure unmixed Indian tea in any town outside London.

It was the same with the American campaign; no success attended the efforts of the commissioners for India and Ceylon until they worked through the *existing trade*, and subsidised the *dealers* who were already in possession of the market for Chinas, when they made purchases of Indians, either for selling pure or for blending as they might think fit.

The frontal attack is an old mistake, but it is still being repeated. The Indian Tea Association is attempting to force the consumption of our tea on the Continent in direct opposition to the merchants engaged in the China trade. Even Mr. Harrington still clings to the idea, although he admits that the only progress made hitherto has been by blending, and, what is more, that the only hope in the future for strong Assams is by blending. Then, further on, in his report he makes a sort of forced admission that "blending with Ceylon or even China leaf should not be entirely barred."

In the Continental market we have to face three things:—

1. The general dislike of everything British, and the jealousy generally regarding our Colonial possessions and trade.
2. The existing taste for China tea, as distinguished from Indian.
3. The merchants engaged in the China trade.

The third item is by far the most formidable, if we attempt to set up an "opposition shop."

Let the Committee of the Indian Tea Association modify its policy. Don't *push* the establishment of separate houses for the supply of pure Indian tea, but work mostly through the merchants already in the tea trade; bring persistently to their notice the *fact* of the superiority of our teas for *blending* purposes. In doing this, a double purpose will be served—the consumer will be gradually trained to appreciate a stronger and better tea, and the merchant will gradually use a larger proportion of Indian, until in course of time there will be no China left in his canister; our tea will beat it purely on its merits.

This has been exactly the course of events in Great Britain, in the Colonies, and will be everywhere.

RAMIE FIBRE.

Among the passengers stranded in Ceylon for a fortnight or so, by the break-down of the French steamer *Sydney*, is Mr. H. C. Bluntschli, of Siak, Sumatra, who, for seven years, has been giving his attention to the cultivation of fibre-yielding plants, chiefly Ramie, and the preparation of the fibre therefrom. Mr. Bluntschli (who has, for many years, been a reader of the *Tropical Agriculturist*) has just returned from Europe, where he has been making a systematic study of fibres in many of the Continental centres of manufacture, as well as in Bradford, and other places in the United Kingdom, and he has entered into an advantageous contract for a steady supply of his raw product. Mr. Bluntschli says the great matter is to get the right plant to grow (and he purposes visiting China to see some of the fibre plants there, specially China Grass). He cuts a crop from his Ramie fields every six weeks—save that twice a year or so, there is a rest from growth during the dry weather. The machines he uses, give from 1 to 3 per cent. of clean fibre fit for shipment, while some use is made of bye-products. Mr. Bluntschli has experimented with pine-apple fibre, getting £30 a ton for two tons to Europe, with an order for any quantity; also with Aloe and other plants. But he deems Ramie, so far, the best and most profitable—the drawback, however, for the planter being that there are at present so few buyers, most of the Bradford spinners, after certain unfortunate experiences, refusing to touch Ramie. Mr. Bluntschli is to send us his latest report on the subject. He is to visit each of the local Botanic Gardens and Kandy and Nuwara Eliya, and we bespeak attention, hoping he will have a pleasant and interesting time. Our visitor, who is a Swiss, speaks English well; and we only wish we had a capitalist of his calibre to develop a new industry in fibres in Ceylon.—*Ceylon Observer.*

MANAGEMENT OF TEA GARDENS.

The following report by Mr. Harold H. Mann, to the Secretary, Indian Tea Association, Calcutta, dated 2nd November, 1900, on the management of tea gardens, is published in the Proceedings of the Assam Branch of the Association. Mr. Mann is the Scientific Officer recently employed to report on these and cognate matters :—

At the conclusion of the stay, just finished, in the Darjeeling district, I have completed a short tour of observation in the principal parts of the tea area connected with the Indian Tea Association. Of the three separate journeys, of which the whole tour has been composed, I have presented short reports embodying the most striking matters I have noticed during my travels. I have further indicated the lines, on which I think my own investigations might most profitably be carried out; but it remains for me now to place before you a larger and more comprehensive scheme for experiments in the field in some of the matters which still remain obscure.

In the management of the tea garden there are, undoubtedly, two natters of primary importance in the cultivation of tea which need nost careful investigation. Of these, the one is the question of the ermanence of the tea plant and how this should be retained, and he other is that of pruning. Perhaps it may be said that these are nter-dependent, and so they are, but for my present purpose they nay be regarded as distinct.

To take pruning first. The cultivation of a plant for the commercial production of leaf, as in the case of tea, is an agricultural process of extreme rarity: in fact, in precisely the present form it s all but unique. To attempt, therefore, to apply the botanical and agricultural principles recognised in fruit culture, for instance, is absolutely out of place. Of course, an ordinary gardener knows that if he wishes to encourage leaf-growth, he must have the largest possible root development and prune after the plant has ceased growing for the season, that is, during the quiescent period of its life. But to do this occasionally for ornament, shade, or any other similar purpose, is very different from cultivation that the plant may produce successive "flushes" of young succulent leaves during the greater part of the growing season,—a process which is an extremely exhausting one for the bush in any case. The object of pruning is practically to enable the bush to continue to give the same series of leaf flushes year after year for an indefinite number of years. But as to the means by which this can best be accomplished, those who have had the largest and widest experience hold diametrically opposite views, all of which are based on facts undoubtedly carefully observed.

In former years it was the custom to prune constantly, so that just the "crow's feet" were annually removed. But this, continually repeated, was found to give a gradually diminishing yield of tea, and so at a later date, when the cultivation was older, it became customary at more or less frequent intervals to cut down below the knots in the wood, and so to *bich kalam* the bushes, leaving after the pruning season just the straight stem with the remains of the main branches above it. Then, again, the fashion came on to leave, at still rarer intervals, just a single stem above the ground, six or eight inches long; and, finally, more especially in Assam during the last five years, collar-pruning, or cutting right down to, or below the surface of the ground, has been extensively adopted for the renovation of a garden which has ceased to yield the quantity of leaf which it might be expected to give.

As I stated above, opinion as to the actual method best to be adopted varies with every garden, and this is only to be expected, for nearly all that has been done in the past in the way of experiment has been done, not under carefully regulated conditions but in the ordinary course of garden practice. The whole matter forms a question which demands most careful experiment.

The second point I have raised is the permanence of the tea plants and the means by which it can be retained. In my report to the Indian Tea Association, dated July 9th, 1900, on my tour in Assam in June and the early part of July, I expressed the view that the older gardens were manifestly deteriorating. This is a position, of the truth of which I am becoming more and more convinced. In every district the older gardens are going down the hill, and apparently little effort is being made to stop this, short of planting out new extensions. But this leads to the presence of a large amount of semi-abandoned or abandoned tea, the very existence of which seems almost a confession that tea cannot be regarded as a permanent investment, but that slowly and surely every plot of tea is bound to go out of cultivation owing to exhaustion of the soil or plant I hope that the series of analyses of Assam soils I shall undertake on my return to Calcutta will give some indication of the needs of these pieces of tea which are now the eyesores of almost every garden and every district, but I wish to impress upon you now the necessity of actual field experiment into the manuring best suitable for bringing back these plots of tea to their normal condition. It might be said that we need only apply the experience of Ceylon to our Indian conditions, and go in for manuring on their lines. This, I think, is an error, for the position of Ceylon renders artificial manures cheaper there than here. Further, they have little facility, compared with us, for obtaining local sources of supply, and they are not nearly so conveniently situated for making the soil itself produce its own manure. Nevertheless, this side of the matter might perhaps stand over until my work on the Assam tea soils indicates more definitely the lines on which profitable manuring will most probably be carried out. Not so the other question of pruning. I suggest that in Assam, at any rate for the present (and later at several places in other parts of tea area), four places be taken of about five acres each, containing tea which badly requires treatment of some sort, and that these five acres be treated according to my directions, and careful accounts kept of the different methods of pruning adopted, the yield of leaf, and the cost of each plot. Thus, for instance, suppose five acres be taken of this sort, I might first give the whole a good dressing of manure, local or artificial, and divide into five plots and treat as follows:—

Plot I.—Leave alone and light prune.
Plot II.—*Bich kalam.*
Plot III.—Prune six inches above ground.
Plot IV.—"Collar-prune."
Plot V.—Uproot the whole, fallow with a crop of *muttee kalai* to be ploughed in later, and fresh plants of tea put in June.

A profit and loss account would be kept in each case against each plot, and after, say five years, we would be able to give definite results and planters would have the conclusions of experiments made under identical conditions. I propose that there be four such stations in Assam—one on the north bank, say at Tezpore or Bishnauth, one in Dibrugarh, one in Sibsagar, and one in Nowgong. Such a set of experiments would cost the Association some money for manures, etc., and I suppose the Association would be found to be responsible for ultimate damage done to the area. The whole expense I might put down at not more than Rs. 500 per annum, unless the managers of the gardens involved received an honorarium for carefully attending to my instructions and reporting to me the results throughout.

The only points on which I should insist in this matter are that—

(1) I should have absolute control of the area chosen.

(2) The managers should be men who would *take the trouble* to make the necessary weighings and reports.

(3) The experiment should be permanent for at least five years.

During my present tour in Assam I should like to be able to select the gardens and make arrangements if possible. I have already gardens in my mind's eye which would be suitable in three out of the four districts mentioned above, but should like to have authority to definitely make arrangements if you consider the whole experiments as wise and a step in the right direction. I may say that the above ideas embody the result of a long discussion I held with Dr. Watt on this subject, in the Darjeeling district, a few days ago.

Thus would be commenced the first step in the comprehensive scheme I have placed before you for field experiment on pruning and manuring. It must only be considered as a step, but as a true step towards placing the agriculture of tea on a sound and solid basis of experiment and definitely ascertained fact.

Hoping to hear your decision in this matter at your earliest opportunity.

NOTES FROM THE *I. P. G.*

Last year's crop of tea on the estate of the Russian Ministry of Apanages, in Tschakva, amounts to 150 poods, against 19½ poods last year. The whole crop has been sold to a Moscow firm at 1r. 50k. per Russian pound. It is said to resemble Ceylon tea very much in taste.

Up to 1892 Annam tea was cultivated only for use among the natives, and the proposition to cultivate it for European consumption seemed a chimera. But the consumption of tea in France was increasing very rapidly. From 1,447,635 lbs., consumed in 1892, the quantity rose to 1,794,832 lbs. in 1898 and increased by nearly another 100,000 lbs., in 1899. The supply was almost entirely from China and Ceylon.

The tea from Annam is said to equal the finest article produced in China. It is in very general use in the French army in Annam, and it is only believed to be a question of time when it will meet the entire demand in France. The production is daily increasing. The old colonists are going into the business of growing tea, finding it more profitable than any other occupation.

The above statements, culled from a French report, are not very favourable as to the prospects of Indian and Ceylon tea in France. They must, however, be accepted with a considerable "pinch of salt," as it is highly improbable that Annam tea will ever be able

to compete with the British-grown product. It is hoped that the standard of tea will be raised in France and that the Ceylon staple will be supplied to the army. Strenuous efforts are being put forward to achieve these most desirable results.

Mr. Rosling's suggestion to give up plucking 10 per cent. of the area in cultivation is exciting very opposite opinions. The *Ceylon Observer* does not think it likely that India will be got to agree. In an article on the subject of Mr. Rosling's proposal, it says that it "is practicable and sufficient on the face of it *if* only unanimity and a sense of honor in its support could be calculated on to prevail throughout the tea districts of India as well as of Ceylon. There lies the difficulty. Did the issue depend on Ceylon alone, Mr. Rosling could make quite sure at once of his 80—nay 90—per cent. But how is it possible, in view of past experience, to expect any such result in the case of India?"

The writer's views may appear to savour of selfishness, but they appeal to common sense. It is a law of nature that the weakest go to the wall, and a process of weeding out is constantly going on. Mr. Rosling's scheme is practicable if proprietors of Indian and Ceylon estates could be induced to combine; but we have not yet reached the millennium, so we fear there is little likehood of unanimity. "Each one for himself" is at present the rule, and is likely to remain so, until human nature is different to what it is.

A letter from a Ceylon planter lately asserted that the Island and South India generally could in the future turn out tea cheaper than Assam and Bengal, but though the Brahmaputra Valley may be handicapped by its greater distance from the coast, the railway should ensure teas from the Surma division being laid down at Chittagong at least as cheaply as either at Colombo and Beypore, or whatever may become the tea export for Travancore and the Wynaad.

That Chittagong must eventually become the outlet for tea and other products east of the Jamoona is inevitable, and now that facilities for reaching it are inexpensive and rapid, we see no valid reason for objecting to this. Tea is of course chiefly dealt in for export, and the sales would still be held in Calcutta, for brokers can do the necessary sampling and valuation work, at the port and, certainly, there is not much chance of any keen competition at the auctions. Buyers attend with their minds fully made up beforehand as to how far to go, as has been the rule for some time past, so that producers, inclined to doubt whether they will get as fair play as under existing circumstances, may rest satisfied on that head.

CEYLON TEA ON THE CONTINENT OF EUROPE.

Mr. J. H. Renton has written as follows for the information of the Planters' Association of Ceylon :—

DISPOSAL OF PLANTING EXHIBITS AT THE EXHIBITION.

MY DEAR ROSLING,—I ought ere this to have advised you that in accordance with arrangements made with Sir William Mitchell, I prepared and made up full and complete exhibits of tea, cocoa, cardamoms, and coffee for the following institutions which were to accompany Sir William Mitchell's commercial exhibits to the same places:—

1. Imperial Institute, London.
2. Colonial Institute ,,
3. Kew Gardens, ,,
4. Industrial Museum, Rouen.
5. ,, ,, Lyons.
6. Stadtisches ,, Bremen.
7. Jardin Colonial, Paris.
8. State Museum of Philadelphia.
9. British Chamber of Commerce, Paris.
10. Stadtisches Museum, Hamburg.
11. Imperial Museum, Vienna.

Through a misunderstanding Nos. 9, 10, and 11 were sent to me by Mr. Davidson, and did not accompany the other Commercial Exhibits. I forwarded the first two, but not the last, which I transferred instead to the Agricultural Museum in Berlin. When in Vienna next month I shall see if they want specimens of tea, cocoa, and cardamoms, and write you. The Hamburg people think it would do more good if I allowed the samples to be taken round the country by the travellers of one of the large firms. They can afterwards be placed in the museum. I find the specimens of gold and silver tip tea have excited a great deal of attention, and so have our cocoa, vanilla, and cardamoms. I may mention that I distributed the gold and silver tip tea amongst as many museums as possible. I also gave full samples of commercial teas—Broken Orange Pekoe, Pekoe and Pekoe Souchong. Before dealing with exhibits of tea I obtained permission from the head office in London, of those companies who had directed that the exhibits were to be returned to them, to deal with the exhibits as I judged best.

I had to pay duty on all the tea sent for exhibition. I recovered the greater part of the amount from sale of the balance of the tea which I did not require for specimens for the museums, but as Government have paid the duty on all the other planting exhibits, I do not understand why tea should be the only exception, and think the difference between the amount I paid, and the amount I recovered should have been refunded.

Sale of cheap Ceylon Tea.—I enclose two cuttings from the *Daily Telegraph*, of 12th and 13th, calling attention to the sale of Ceylon tea at 2d. per lb. in London. The sale of tea of this description, and the prominence given to the sale by a leading London newspaper are immediately seized upon by our opponents on the Continent. It is not much good issuing pamphlets describing the purity and merits of Ceylon tea, when Dutch and French firms are able to prove from English sources that Ceylon does export rubbish.

Tea in Austria.—I am glad to be able to report that one of our Paris friends has established an agency for sale of pure Ceylon tea in Vienna. Another has also been established in Berlin.

Tea in Italy.—I hear from Florence that tea-rooms have been started in Rome and Florence and Ceylon tea is making way there considerably now.

ECONOMIC PRODUCTS ON THE NILGIRIS.

In August last, says the *Nilgiri News*, the Curator of the Government Gardens, submitted a proposal to the Nilgiri Agri-Horticultural Society, for encouraging Economic Products in this district, by awarding prizes for such articles as were produced in any stage of progress at its periodical shows. The matter, at that time, was thought to be worthy of discussion.

When it came up for consideration at a subsequent Committee Meeting of the Society in December, Mr. Standen suggested that the Government should be requested to espouse the cause of Economic Products, by allowing the Curator to establish experimental plots in the Botanical Gardens, as more likely to yield good results than small money prizes awarded by the Society at its shows.

The Honorary Secretary on the same occasion thought the awards, if given by the Society, should take the form of honorary recognition by medals, rather than that of money prizes, and these ideas, with Mr. Proudlock's original minute, were referred to a Sub-Committee consisting of Messrs. Weir, Barber, Standen, Minchin, and Proudlock.

On the 4th instant, this Sub-Committee finally dealt with the subject. It reviewed the list of Economic Products exhibited on the 2nd June last, consisting of 12 specimens of Phormium Tenax Fibre, 5 of Ordinary Plantain Fibre, 1 of Musa Textilis, 5 of Cordyline Australis, 2 of Lasiosiphon Eriocephelus, 4 of Nilgiri Nettle, 1 of Potato Starch, 1 of Camphor Leaf Oil, 1 of Ficus Elasticus, 5 of Ooty Timbers, 18 of Ceara Rubber Products, and 1 Rubber Tapping Knife, and came to the conclusion, that the offering of prizes for new Economic Products would not of itself induce the investment of capital by private individuals in untried industries.

It also resolved to suggest to Government, in the spirit of Mr. Standen's advice, that some land situated conveniently near Ootacamund, should be placed at the disposal of Mr. Proudlock, for experimental cultivation of industrial products, together with a small grant of money for this purpose.

A very important matter that has been overlooked by the Sub-Committee, is the change that has come over the views of the Madras Government in respect to Economic Products of this Presidency, and the duties of the Government Botanist in relation thereto, during last year. Mr. Barber, in accordance with those views, will hereafter devote preferential and increased attention to Economic Products, so long as he is the Government Botanist of Madras, and if he does so, it will conduce to confusion to have two independent officers working in one field, where none worked before. Probably Government may not overlook this important element in deciding upon the Agri-Horticultural Society's proposals when they come before it, as we presume they will in due course.

NOTES FROM BRAZIL.

(From the *Brazilian Review.*)

Coffee.—The Santa Barbara cane crop is a short one this year.

A coffee cleaning mill was destroyed by fire on 1st instant in Botucatú.

Planters in Uberába and neighbouring districts are giving their ttention to viticulture on a considerable scale.

In Ityrapina, in consequence of the low price of coffee, buyers are epositing it in private warehouses, there being already a stock of ver 2,500 bags stored in this way.

Santos, December 8th, 1900. —The improvement of last week was ot of long duration, although there was a sudden rise of prices on Monday and Tuesday owing to some odd report of *rains* having done lamage to the next crop. Now, although we do not believe that ll those promises of an exorbitant yield for next year will be fulilled, for reasons given in our last report, we do not think that the ast rain has done any damage, rather the contrary.

However it may be, speculators in consuming quarters, who must e now rather for the fall than for the rise got frightened and covered hastily by buying whatever was offered in c. & f. and the sales again brought buyers here into the market at prices which were very near 7$000 for *superior*, but as dealers stuck out for the round figure, only comparatively little was sold at the advance which was very shortlived and gave place to a dreary collapse aided by large arrivals. Dealers were too greedy and, therefore, missed a good opportunity of getting rid of a certain quantity at least of their over-large holdings.

We quote 6$300 to 6$800 for *superior* as extremes during the week. A further collapse of prices was only prevented through the extreme weakness of exchange which fell to 9 3/4d. yesterday, but closed firmer at 9 7/8. Coincidently the coffee market got livelier and a fair amount changed hands for export at about 6$400 to 6$500 as orders could easily be filled with the low rate of exchange.

The demand has usually been for medium and lower grades, the Americans having come in again lately. *Fine* qualities continue neglected. *Peaberry*, more in good demand, but mostly medium grades *Goods* were asked for, quotations for this kind remain the same as last year.

Receipts have been larger again during the week under review and have almost reached the total of 5,000,000 for the crop year. To look for any causes to explain this increase is very difficult, some people say the fine weather following the heavy rains of the last week of November are answerable for it, others, the better currency prices. If it is the weather, we should look for smaller receipts again during next week, as heavy rains have set in again.

Shipments have been light on account of little steamer room for Europe, they will be large from now onward, as Europe, especially Havre, has bought a fair quantity at prices ranging from 32/6 to 34/- for *good average* and 34/- to 35/3d for *superior*. Rotterdam and Hamburg also took a certain amount at similar prices, freight for these ports being 3d. higher, so that we can look forward to a decline of our stock at the end of this month. The States have not bought anything worth mentioning.

December 18th.—Entries during the week ending, 16th instant, were 17,266 under those of the preceding week and even 9,172 less than those of the corresponding week last year. Whether the shrinkage is to be considered as a sign that up-country supplies are getting exhausted or merely that planters are keeping coffee back in anticipation of higher prices at S. Paulo as they are reported to have been doing in Rio and Minas, would, however, be premature yet to decide.

Taking the balance of the current crop to be probably about equal to that for the same period last year, the total yield for Santos and Rio will amount to 10,201,059 bags against 9,956,547 bags for last crop.

With the enormous stocks already in hand and the almost certainty of a monster crop next year, the prospects of coffee, as far as prices are concerned, certainly do not seem rosy, the only consolation being that when they have touched bottom they can go no lower, and that with quotations at 9$000 per *arroba* in Santos it must be already nearly reached as far as we are concerned. It is true that foreign prices may be pushed down still further, but only successfully should exchange fall too simultaneously. At present, it does not seem likely that a campaign to bear exchange would prove successful unless coffee sales were practically suspended. The anxiety to dispose of the heavy existing stocks will, however, probably prevent that and keep up a sufficient supply of bills to meet trade demands even in face of falling prices, here and abroad. It is, we believe, possible that currency prices for coffee already brought down may have to give way further still, but as regards the new crop there is clearly a limit which cannot be passed without affecting supplies and causing a reaction That limit seems to have been reached, nor does it seem probable that coffee would, except in exceptional circumstances, be marketed here at much under that figure. There will, no doubt, be a determined effort to bear exchange, and thus ease prices here; but whether in the state of the market such an attempt could be long successful seems very doubtful. The probabilities seem, therefore, to tend to temporarily lower currency and gold prices with a firm or even rising rate of exchange, and a reaction next year when current stocks have been disposed of and only new coffee can be relied on

Exchange.—Extremes during the week ending, December 7, were 9 11/16—10 1/16d. for 90 d/s Bank paper, and 9 29/32—10 1/8d. for private

The average Bank 90 d/s counter-drawing rate for the week comes out at 9 59/64d., the corresponding sight rate being 9 55/64d. against 9 61/64d., the average sight rate of the *Camara Syndical.*

The average depreciation for the week, calculated on the basis of the Banks' sight rate, is 63·25 % and the premium on gold 172·09 % against 62·84 % and 169·05 % last week.

Rio, December 10th, 1900.—Ninety days' rate on London opened on Monday, 26th ultimo, at 10 11/32d., fell to 9 13/6d. on the 28th, rose again to 10d. on the 29th, and after opening this morning at 9 13/16d., rose to 9 7/8d., and finally closed at 9 25/32d.

Since we last wrote, a fortnight ago, rates have been all over the shop and gone up and down without rhyme or reason at the behest of sentiment and speculation. As far as real factors go, we can see absolutely no causes for weakness and are convinced that, unless something should occur to seriously alarm the market and precipitate remittances, there is no more reason for rates to be slumping now than a month ago, indeed much less. The balance sheets of the Rio, S. Paulo, and Santos exchange Banks (all of which have been received, except the German from S. Paulo) show that the liquidation of the bull deal of July is nearly complete, cash showing 8,713 contos less than on 30th October, whilst the nett debit to Home Office and other Branches is reduced from 17,161 contos to only 7,714 contos. The cash in these 12 Branches only exceeded their deposits in account current by 6,870 contos and though, of course, it is possible that these may be utilized, as last year, for purchase of bills it does not seem probable that such will be the case in view of the delicacy of the situation and necessity of holding good reserves. This time, last year, the cash balance was even lower than now and in lieu of a debit the balances showed a considerable credit with Home Office and Branches.

It is, of course, possible that if what is termed the Elias Fausto bill should pass, a panic might ensue in consequence of which remittances would be so considerable as to force exchange lower still; but, as a matter of fact, fixed deposits, which are the kind that would be chiefly remitted, have never been lower than at present and do not exceed 40,000 contos for all the 25 Branches, a very large proportion of which is unqestionably local money. We do not, therefore, attach much importance to such anticipations, as, should rates fall much, remittances of this kind would soon stop, and, moreover, there seems but little chance of the bill becoming law in its present form or of being put into execution if it did. Looking, therefore, to the real factors of supply and demand we find that the value of both coffee and rubber to be shipped to the end of the crop is more considerable than last year, whilst the stringency of money is even greater. If, with circumstances certainly less favourable last year, a decided upward movement of exchange set in in January we see no reason whatever to anticipate that the present weakness should be more than transitory or that a reaction may not begin from one moment to another. There is every likelihood next year of an early crop and, consequently, of the annual boom in exchange setting in earlier than usual.

With such prospects and the probability that Banks will not utilize deposits to any extent to take exchange, it seems that a bear movement is particularly dangerous. Last year, in spite of the Banks taking so heavily that cash fell considerably below their liability for current accounts, rates were maintained almost level from October to December and in January commenced to rise. The supply

of bills was, in fact, not only sufficient to satisfy market requirements, but the remittances of the Banks as well. This year, with a higher value for coffee, we see no reason why, even should that policy be repeated, rate should not be at least maintained, if even they do not rise. The only factors for the fall are, we repeat, of a sentimental or moral character that may change at any moment and the present tendency be replaced by an equally optimistic and bullish movement. It is true that towards the end of the year remittances are generally more considerable, but against this must be placed this year the peculiar position of the market and the extraordinary stringency of money all over the country. If stringency is a bull factor at all, it may be expected to excercise its influence now when cash balances at the Banks are lower than they have ever been.

December 17th, 1900.—Ninety days' rate on London opened on Monday, 10th instant, at 9 13/16d., rose to 9 7/8 on Wednesday, and finally closed this evening at 9 11/16d.

Whatever the cause may be, whether the proximity of the liquidation or the irresistible logic of over-supply, the fact is indisputable that the rampant pessimism has disappeared and, in spite of falling coffee prices, given way to a feeling of almost hopefulness. No exertions of the bears have succeeded in forcing rates to 9 1/2d. as was promised and even should coffee continue to fall, the heavy amounts still to go forward will make up in value what is lost in prices. So far rates at Pará have been weaker even than here a sure sign that all available bills are absorbed locally leaving nothing yet available for this market. This is, however, an annual occurrence, but in a month at latest local requirements may be expected to be satisfied and a balance of rubber bills spill over to this market.....

The worst feature is, as we have said, coffee, but as stocks are almost double last year it is clear that a very considerable fall in sterling prices could be suffered without the value of exports and, consequently, the supply of bills falling below last years.

It is possible, of course, that speculation may attempt to push rates lower, but the general feeling seems to be that the market is already over-bought and cannot carry much more.

COFFEE IN CEYLON.

EARLY DAYS.

Under the heading of "Ceylon in the Twenties—A Peep into the Past," the *Times of Ceylon* gives some very interesting extracts from writings of the late Mr. John Capper. Among them we find the following references to the early days of coffee in the island :—

COFFEE.

As a country gentleman, he had long been engaged in farming, taking great interest in all agricultural operations; and, though his ability to guide the plough, mowing and reaping, could not have enabled him to succeed in coffee cultivation, this aptitude, no doubt, gave him some advantage in the pursuit of the new industry. Very cordially received by Sir Edward Barnes, he lived for some time with his brother, who was appointed Commandant of Kandy, and during his residence in that town, had opportunities of seeing the coffee plant growing in great luxuriance in the vicinity of Buddhist shrines and in native gardens, for the sake of its pretty jasmine-scented flowers, rather than for its fruit. It was for this purpose that the first coffee seed taken to the island some centuries ago by pilgrims from Mecca, and by them presented to the Sovereign, was shown in the Royal Garden at Hanguranketa, fifteen miles from Kandy. Thence young plants of coffee were in later years distributed to various Vihares and gardens throughout the country, and their produce eventually became an article of barter with Moormen traders, who carried it to Colombo for sale.

The beautiful flowers of this plant attracted the attention of Mr. Moon, the first Superintendent of the recently formed Botanic Gardens of Peradeniya, who, with the Governor's assistance, procured a supply of Arabian coffee from Mocha, which he grew in his garden in order to compare its produce with the coffee grown in the island, but without detecting any material difference. For a short period Mr. Bird succeeded Mr. Moon in the charge of the Peradeniya Garden, and it was with young plants and stumps from older plants from seed, which had germinated under the bushes in the garden, that the first coffee estate was planted at Gampola on the site of the present Mariawatte plantation.

OBSTACLES SURMOUNTED.

The earliest and most series difficulty which beset the introduction of coffee cultivation into Ceylon was the absence of any kind of suitable tools. The sole agricultural industry of any importance was that of rice-growing, and the only implements employed were the light Kandyan axe, the cattle, or billhook; the heavy, cumbrous kodalie or rice-hoe; and the diminutive wooden plough. These, however, could be rarely purchased; when required they were made at one of the Gampola forges from native ore, and so rude and tedious was the process, that an ordinary gun could not be produced in less than three months. The course followed in those days, when tools were required, was for the cultivator in need of them to proceed to the district of Dolosbage, where iron mines existed; there he purchased one or two pingo loads of the ore and, with a supply of charcoal, he returned to one of the Gampola smithies where, according to custom, it was incumbent on him to ply the bellows whilst the Vidhany or smith, worked at the anvil. To have adopted this primitive method of obtaining a supply of tools for his estate, would have involved a delay of possibly two years; and Mr. Bird, not being inclined to toil at a village forge for that space of time, deemed it preferable to send an order to London for such tools as he required, similar to those employed in the West Indies. This course required, however, fully a year before the order could be executed and received, for the opportunity of sending letters to England was so precarious that it was found an economy of time to despatch the order by one of the sailing ships leaving Madras every three months, the letter being carried thither by a Post Office runner, who, in rainy weather, took about the same time to reach Madras as that in which the Mails now reach London by the Suez Canal.

THE FIRST COFFEE ESTATE.

The first estate opened and planted up by Mr. Bird on land attached to what had once been a royal residence at Gampola, a dozen miles from Kandy, was not his original selection. He had in the first instance chosen a tract of flat alluvial land at Peradeniya, afterwards known as a sugar estate. This he cleared from low jungle, and had commenced preparations for planting it with coffee, when the Governor expressed a desire to have it to cultivate on Government account as an adjunct to the Botanical Gardens, offering Mr. Bird any other block of land he might select, and recouping him for his outlay; and this resulted in his taking possession of a tract of level land close to the small village of Gampola. It was supposed by the earlier pioneers of coffee planting in Ceylon that the shrub could be cultivated only on comparatively level ground, and on the same system as that adopted by the natives, and left to grow naturally and untouched by a pruning knife. The soil on the land selected was, however, eventually found unsuitable for coffee, and, though a huge elephant plough was employed to turn over deep furrows between the rows of plants, and so promoted a more vigorous growth of plants, the yield of fruit was small.

BRAZILIAN COFFEE.

The Santos correspondent, of the *Brazilian Review*, writes under date, 15th December, 1900 :—

Our coffee market eased off further during the week owing to the decline in the consuming markets and which were adversely influenced by larger receipts than anticipated and favourable crop news. Exchange fortunately kept low and so dealers had at least the satisfaction of being able to sell at a fair price, as plenty of orders were sent out at the decline. Yesterday, when European markets certainly improved, an extensive business was done, but to-day, however, with very discouraging news from consuming quarters buyers here have almost entirely withdrawn, although we have to mention that dealers are not anxious sellers at present prices and give way very reluctantly. We quote: 6$000 to 6$400 for *superior goods* rule 400 reis, and *regulars* 609 to 800 below, *prime* 300 to 500 reis above that price. The demand ran chiefly on medium lots, *primes* remain neglected and so are low grades, as the States are out of the markets. There was some demand for *Peaberries* which were sold at 8$700 to 9$000 for *superiors*, 8$200 to 8$500 for *goods*. For some specially fine *Peaberries* as much as 10$000 was paid for small lots. Demand for these goods has since fallen off.

Receipts, notwithstanding low prices, have kept up. We presume planters think it is better to have the goods in Santos on the spot in order to be able to profit by any sudden improvement than keep the goods on the *Fazenda*. Our dealers facilitated this up till now by advancing money on goods consigned to them, but they are going to strike, now, as they see what bad policy it was to allow the accumulation of such an enormous stock here.

Shipments have been large as could be foreseen and the stock diminished by about 15,000 bags daily. Some very large estimates for the next crop, both in Santos and Rio, seem to have gone forward ately as anticipated by this *Review*. However justified, these crop guesses might be just at present, one very important point is entirely lost sight of, that is the labour question and specially the ow price.

The writer of the leading article, on law 184 in No. 50 of this *Review* says:—"In addition it seems likely that the coffee crop will be the largest on record and that the difficulty in disposing of a surplus of, perhaps, 2,000,000 bags may drive down prices abroad and, with prices, exchange, he says further." It is equally certain that currency coffee prices here have nearly reached bottom and cannot be reduced much lower, no matter what the crop be.

One naturally deducts therefrom that there is no hope for either coffee or exchange, one must bring or keep the other down, but is it likely or is it possible that in view of such a miserable state of affairs all the produce which has grown will be gathered? First all those plantations lying far back from railway stations as in the sertão of Jaboticabal, Jahú, Serra dos Agudos, Avaré will be eliminated as producers, as cost as transport would swallow up everything. Further, a great many planters are dependent for the maintenance of their farms on the monthly allowances made by the *commissario* for that purpose only, from the month of December onwards till the new crop is gathered in May to July. These advances will be largely curtailed now as it is beyond doubt that *commissarios* will be extremely careful, the more so as large capital is still locked up in the depreciated coffee lying here; the difficulty or impossibility of getting sufficient funds to pay for the necessary agricultural work must inevitably bring about a further reduction of the output.

Adverse climatic influences we shall not take into consideration here, although dry, hot weather from January onward would be sufficient to produce the contrary effect of what the rains did at the beginning of this year, *i.e.*, reduce the yield 10 or 15 % less on a crop the prophesied magnitude of which runs up to an important figure. Last, but not least, the Labour question which in former years has often been wrongly used as an argument for higher coffee prices threatens to become at length acute.

We read in No. 501 of this *Review*, that the excess of exits over immigration up to 30th September of this year was, for our State alone 13,259 persons, the natural consequence of the unprecedented rise in exchange in June and July, which for the first time for years allowed the labourer to leave this country with an appreciable sum of money in gold. The agricultural labourers amongst these immigrants were experienced and accustomed to the work required, some of these may come back, but most of those to arrive now have to start learning their work.

Now the number of immigrants during November was 2,266 and although more are expected, it is doubted by many competent people that a sufficient number of hands will arrive to prepare the coffee fields for the crop and gather the produce, and complaints about insufficiency of labour are heard everywhere. It has often been said, that as soon as economical conditions of Italy would improve, we should feel the counter-effect of it here and there cannot be any doubt that this is the case now. Readers in Europe who are better able, as they are near, to form an opinion about economical conditions of the country which supplies by far the largest number of our agricultural labourers can judge for themselves.

Should the currency price of coffee continue to remain as low as at present, a great many of our planters will not even be able to have labour and we presume from all we said before, that however brilliant the outlook for the next crop may be now, a large percentage of it will not be harvested unless currency prices rise again, and that in the near future, because the preparations for the crop have to be undertaken in a short time.

It is, therefore, foolish on the part of Brazilian financiers and of coffee dealers in consuming countries to base any calculations on the fact that a large crop of coffee may be on the trees.

When currency prices last year in the beginning of the crop were reduced to about 6$, planters had already gathered the crop and had nilly willy to submit to the price their produce would fetch, as they had to pay the wages incurred. This year it is different, as prices have fallen towards the end of the crop year and a great many will prefer to abandon their next crop than incur a debt for wages, which the market value of the produce hardly covers, but in no case can leave anything for the planter himself.

Difficult and anxious times are again in store for the Brazilian coffee grower.

To come back to our market report, we have to state that Havre has again been our principal buyer at prices from 31s. 6d. to 32s. 6d. for good average, and 32s. 6d. to 33s. 6d. for superior. Rotterdam also bought a little more actively, Hamburg was quieter, and New York did not do anything at all.

AN UNPROFITABLE TEA TRADE.

Those engaged in the tea industry in Ceylon are much exercised over the unprofitable business which a number of companies engaged in the trade have experienced.

All are agreed that the heavy quantities of Indian and Ceylon tea, and particularly the former, are the cause, but all are not agreed as to the ways and means of remedying it.

One thing is certain, there is not likely to be much improvement until there is a marked curtailment in the quantity of low-grade tea, which year after year is thrown upon the market.

On the Canadian market, the excess of low-grade tea has frequently been such as to maintain a local weakness when values ruled strong abroad.

Although the consumption of Indian and Ceylon teas is increasing, and that rapidly, there is no immediate prospect of the increase being so great as to overtake the supply.

It is estimated that the increase in 1900 in the consumption of Indian and Ceylon tea in countries other than Great Britain will be about 12,000,000 lbs., but it is also estimated that the increase in production will be still larger. Then, China is shipping some 17,000,000 lbs. more than in 1899 to Russia, Australia, North America, and parts of the world other than the United Kingdom. To the United Kingdom the quantity is 6,000,000 lbs. less. The increase in the shipments of China tea is explained to be due to a desire to avoid the risk that would be entailed by keeping it at home while the country is in such a disturbed condition.

One of the features of the situation from which some consolation can be drawn is the relatively better position on the market of the finer grades of teas. There is a demand for these on both sides of the Atlantic that exceeds the supply.

The pendulum is evidently swinging in the direction of better goods in practically all lines of merchandise. And it is certainly not to be regretted.—*Canadian Grocer.*

DISTRICT ASSOCIATIONS.

INDIAN TEA ASSOCIATION.

The following is an Abstract of the Proceedings of a Special Meeting of the General Committee, held on the 11th instant:—

There were present:—Messrs. H. C. Begg (Chairman), W. Brown (Vice-Chairman), H. S. Ashton, R. H. A. Gresson, R. Magor, A. Tocher, and T. Traill.

A letter had been received from Mr. R. R. Toynbee regretting his inability to attend.

Considered the following telegram, dated 8th January, from the Secretary, India Tea Association, London:—"Movement initiated, curtail output 10 per cent., India, Ceylon. Would a proposal be entertained, urge the matter, forward all you can." The Committee discussed this telegram and decided to submit copies of it to the members of the Association for their consideration. They were not prepared to express an opinion as to whether any scheme for reducing output could be successfully put into force. But in the course of the discussion the following suggestions came under review:—

(1) The temporary abandonment of 10 per cent. of the area in full bearing.

(2) The fixing of a date for closing manufacture in each district.
(3) Generally finer plucking.

Mr. Traill expressed himself as being in favour of a general adoption of finer plucking. In the event of the output not being thereby sufficiently reduced, he suggested that a percentage of the crop, consisting of low grade teas should be made over to the Association to be disposed of in encouraging the consumption of tea among the Natives of India.

It was agreed that any action in the direction of an attempt to reduce output must be in the nature of a combination between India and Ceylon. Isolated action on the part of either Indian or Ceylon growers would, the Committee considered, merely result in a transference of a portion of the trade either to India or Ceylon as the case might be. It was thought to be very desirable that a combination should be formed, but the Committee fully recognised that it would be a matter of great difficulty to put any scheme for reducing output into successful operation. Finally, it was decided to send copies of the telegram from the London Branch to Proprietors and Agents generally, and, at the same time, to ask them whether, in their opinion, any one of the proposals noted above, or any combination of them, was practicable. Reference was also to be made to a letter lately addressed by the Chairman of the Ceylon Planters' Association to a Ceylon newspaper on the subject. In this letter, Mr. Rosling expressed the opinion that by resting for two years a certain percentage of the acreage in bearing a sufficient reduction of outturn would be effected.

The Committee inspected six samples of Travancore green teas made by Mr. H. Drummond Deane, of Stagbrook, Peermaad. These samples which had been submitted by Mr. H. St. John Jackson, the Editor of *Indian Gardening and Planting*, had been favourably reported on by Messrs. Moran & Co.

The Secretary was instructed to express the acknowledgments of the Committee to Mr. Jackson for having placed the samples at their disposal.

It was also decided to write to Mr. Drummond Deane with reference to certain remarks made by him in the same newspaper regarding the procedure under which the bounty paid by the Association upon the manufacture of green tea was allotted. Mr. Deane complained that shippers of green tea from coast ports in Southern India would not have the bounty paid to them if they shipped the teas before the report of the Association's experts upon the final samples had been received. There appeared to the Committee to be some slight misapprehension on the point. They had no objection to shippers in such cases despatching their teas to America at their own risk. They only required that samples should be drawn from the manufactured teas and submitted to their experts. If the experts reported favourably on the samples, the bounty would be paid whether the teas had or had not been shipped in the meantime. But if the experts reported unfavourably, the bounty would not be paid in any case.

It was agreed to set aside a sum of Rs. 100 from the American and Foreign Market Fund for the purpose of giving effect to a suggestion made by the Government of Bengal (*see* Circular No 73, of 12th December, 1900) that some of the Tibetan traders in wool should be asked to take consignments of Indian tea into Tibet. Messrs Kilburn & Co. were to be asked to arrange for a small quantity of tea to be made into bricks suitable for the Tibetan markets at their Pashok garden.

CENTRAL TRAVANCORE.

The Annual General Meeting of this Association was held at Arnakal Bungalow, on Saturday, January 12th, 1901. PRESENT:—Mr. W. H. G. Leahy (Vice-Chairman), Hon'ble Mr. G. L. Acworth, Messrs. B. Lawrie, H. D. Deane, R. S. Imray, G. N. Thomson, E. Latter, F. Bissett, H. S. Holder, H. J. Blandford, E. R. Williams, R. W. Cole (by proxy), and A. E. Veale (Honorary Secretary).

The Honorary Secretary having read the notice calling the meeting, the minutes of the last meeting were taken as read. The Chairman then addressed the meeting as follows:—

GENTLEMEN,—It is usual and I think the duty of the Chairman to report progress for the past year at the Annual General Meeting, therefore I will ask your indulgence for a short time, while I give you a brief resumé of the year's work of the Association and draw your attention to other matters of interest to us.

It is exceedingly gratifying to see the keen interest taken by all in Association matters as shown by the full attendance at all our meetings. Twenty estates are on the rolls of the Association, of which 6,429 acres are in tea and 222 acres in coffee. The past year's accounts are placed before you, duly audited, and I am glad to say show a credit balance of Rs.91-6-9.

Three of our principal requests have been granted by H. H. Government, *viz.*, building of a new Peryar bridge (for which Rs.52,400 have been sanctioned), the building of a travellers' bungalow in Peermaad, and the free importation of 500 head of cattle for each estate. Gentlemen, this does not sound as if your Association had accomplished much, and there may be some amongst you who may ask, is this all I have got for my 5 annas per acre subscribed? We should not be actuated by that kind of spirit, rather should we ask, would we have got what we have, had no Association existed, or if we had applied individually? You will not always get everything you ask for on the spot, and our policy with regard to Government should be one of persistency, not the persistency that is akin to obstinacy which does not yield to argument or reason, but the persistency which combines persuasion. The principal requests not granted are the Railway survey, the gun license, and the covered landing stage at Cottayam. As regard the Railway survey, I am perfectly certain H. H. Government will more fully recognize and appreciate the benefit of Railways, when the present Quilon-Tinnevelly line is completed. We trust the future policy of H. H. Government in regard to Railways will be a progressive one, and that the talent which at present lies wrapt up in a napkin, to which Lord Curzon referred, will be put out and utilized for Railways and better roads and communications. I think this is a favourable opportunity to again draw the attention of Government to the need of a gun license. You are all aware of the recent accident, whereby a native was killed, due, no doubt, to the ignorance of the native of the mechanism and destructiveness of English firearms. The present Game Act is a dead letter without a gun license, and game is fast being destroyed all over the district. A covered landing stage at Cottayam is also a very important matter on account of the increased traffic, and the granting of this would be a great boon not only to us, but to all shippers of produce and to passengers on the backwater. Another matter to which I wish to draw your attention is the telegraph subsidy, which we have been called upon to pay for last year, although we understood by the agreement between H. H. Government and ourselves that we should only pay for five years. We have been given up to this meeting to decide what we will do, if we withdraw the line will be stopped, and I think we all recognize the importance of a Telegraph Office, and personally I think we should pay our share, but at the same time I may tell you Government are endeavouring to lighten our burden of the share of the subsidy by opening an office at Kanjerapalli as well as keeping the one here.

Gentlemen, the last year of the past century will be a memorable one to the tea industry. Never before has such a concurrence of evils fallen upon us basking, as we were, in the sunshine of prosperity. The South African war upset the tea trade considerably and plague and famine have helped to cripple business generally, but over-production, which was bound to come sooner or later, is, you will admit, the chief cause. We read everywhere of the tea crisis, and things have indeed come to a crisis when we read of large tea concerns going into liquidation. The present low prices have been put down to several causes, amongst them being that poorer teas are being sent home than formerly; but you will note from your brokers' reports that, when the market is good, prices are

THE ART OF SINGING.

BY SIMS REEVES.

"Remedies for the Throat."

"All kinds of lozenges for the voice are to be avoided; some do harm, others have no effect, and none do good. Sugar and water, or a little glycerine, gives relief when the throat is inclined to be dry; this applies to persons whose throats are affected by the weather. About a third of a teaspoonful of Condy's Fluid in a tumbler of water, if used as a gargle every morning, will clear the throat and brace up the uvula, which, in some singers, is so long that it interrupts the pure emission of the voice, and introduces a grating undertone, while it also tends to make a tremolo on the upper notes."—*The Idler*, February, 1900.

ood and teas are good: on the other hand, a bad market means bad rices, bad tea, and surely nobody can say that British-grown teas ave become poorer in quality by two to three pence per lb. in the ourse of a year. Several remedies have been suggested in the lanting papers, but I am afraid anything that may be done to ease ne present state of the market will be but a temporary relief, and, n the end (which for some does not seem far off), it will be the urvival of the fittest. But can we do nothing to delay the dreaded ay, when estates have to stop work is a natural question? We can o a great deal; but nothing better, in my opinion, than by every tea state in India subscribing its full quota to the foreign market nd for exploiting British-grown teas, especially on the continent, here only 10% of British teas are consumed to the 90% of China nd other countries' teas, whereas, in Great Britain and her colonies, ne percentages are in the reverse order. In these days of com- nercial enterprise and consequent fierce competition, push and dvertisement are the two essential qualities for success, but you annot utilize either without money. Money makes money, and noney is what the Indian Tea Association requires to push and dvertise our teas all over the world. I would, therefore, appeal o all to subscribe their full share to the fund (this district has lways paid its full quota), and I trust the two largest tea concerns n Travancore (who, I hear, refused to subscribe last year, but I peak open to correction) will subscribe this year.

Sweet are the uses of adversity, but sweeter are the uses of dvertisement; the powers of advertising are well known. Ask ny of the proprietors of successful businesses, what has given them he large profits and why their goods are known all over the world, hey will tell you—push and advertisement. To those who have ubscribed to the fund, I would say you are helping to raise the narket and have the satisfaction of knowing that you are doing the ight thing not only for your own benefit, but for others as well. To those who do not subscribe to any fund, I wish to point out hat your policy of drift will land you sooner than you expect on the shoals, and that by lying low and pocketing the profits vhich others have helped to give you is conduct unworthy of the community to which you belong. The question of reduced sup- olies as a remedy for the present state of the market is impossible, out the alternative remedy of increased consumption is within our reach.

Mr. Rosling's (Ceylon) scheme in the *Ceylon Times* is practi- cable, except as regards the 3rd condition, which is the most import- ant, and that is the resting of 10% of the acreage on all estates in India and Ceylon for two years. This would hit South India very hard, in view of the fact that vast extensions have taken place within the last few years in tea, and most of the tea will be in bearing this next year, and how can proprietors who have sunk their "little all" be expected to wait another two years before getting any return for their money, The scheme for India. without a doubt, is the tea cess of which this Association approves, and which it would like to see put into force. All voluntary schemes are objectionable, but a compulsory cess, on the same lines as the one in Ceylon, would leave no loop-hole for the present defaulters. It would be fair to all, and would give ample funds to push our tea thoroughly instead of the present half- hearted manner. The Indian Government are unfortunately blind to their own and our interests, and I am afraid the com- pulsory cess will not be sanctioned, but we can still join the other cess scheme known as Mr. Bruce's scheme, and I trust those who took it up originally will try and bring it into force. This Association is also in favour of this scheme.

In conclusion, gentlemen, if my views given to you are at all pessimistic, I have only endeavoured to put things straight to you, and, if any good wishes for the future from me can help you, they are yours. I sincerely trust things will improve and I wish you all, collectively and individually, a Prosperous New Year. I thank you for the honour you have done me in electing me your Vice-Chairman for the past year. My best thanks are due to the Com- mittee for their assistance and advice To the Honorary Secretary I wish to offer my grateful thanks for having made my task such a light and pleasant one—his advice from his knowledge of Association and local matters has been freely given me at all times—and it would be difficult to find a Secretary who has so devoted himself to the interests of the Association. I would also like to thank the Honorable Mr. Acworth for his counsel and information given me, and I know I voice not only my own sentiments, but those of all present when I say that we consider it a great privilege and honour to have had him present at our meetings and for him to be a resi- dent in this district.

I now call upon the Honorary Secretary to read his Annual Report.

Honorary Secretary's Annual Report.

MR. CHAIRMAN AND GENTLEMEN,—The year that has just closed has not been a prosperous one for the tea-planter. Tea prices have now fallen so low that it is only with the greatest care and economy that tea can be made to yield a dividend. Neither do the prospects for the current year seem any more hopeful. Such being the case, it is only natural we should seek the reasons for the present depressed state of our industry. Without a doubt three of the causes are: (1) over-production; (2) the enhanced import duty on tea in Great Britain; (3) the high rate of exchange. With regard to the first, the remedy is in our own hands, and there are only two possible ways of equalizing the supply and demand; one is by discontinuing all further extensions, and the second by push- ing our tea in foreign countries and ousting the China article, as we have already done in England. The Indian Tea Association are doing their utmost in this respect, but it is useless to expect them, or, indeed, any other Association to do this effectually unless suffi- cient funds are placed at their disposal for the purpose. Why Indian planters should be so apathetic in this respect is hard to imagine, more especially when they have before them the splendid example set by the Ceylon planter who, by his push and energy, is slowly but, nevertheless, successfully making a name for his tea in nearly every country in the world. The Ceylon planter, however, has a great advantage in that his funds for this purpose are with the help of Government obtained by a compulsory cess, whereas in India the sum required is met by voluntary subscriptions only, but why this should prevent the Indian planter from loyally supporting the American and Foreign Market Fund of the Indian Tea Association is inconceivable. This Association has, however, nothing to blame itself with, for we have always contributed our just quota.

Further, we have always been in favour of a compulsory cess, and at our last meeting we approved of what is now known as Mr. Bruce's scheme. This scheme has been laid before the U. P. A. S. I., who will, I am sure, not lose sight of it, for the Chairman, Mr. H. P. Hodgson, is keenly alive to the necessity of opening out new markets for our produce.

The enhanced import duty in England has put a stop to all increase in consumption even if it has not had the effect of decreasing it. The U. P. A. S. I. is now considering the advisability of approach- ing the British Government with a view to the removal of the extra 2d. on the introduction of the next budget.

The high rate of exchange at which we have to get our remittances is also a severe handicap, but nothing can be done to alter this now that Government has fixed the rate of exchange.

U. P. A. S. I. Annual Meeting.—The Labour Law has not yet come into force, and all Mr. Acworth was able to tell us was that it had not been lost sight of. The delay is, I believe, due to the Supreme Government, to whom the Bill was sent for their approval. I trust, however, that the Bill will soon be passed.

One of the most important subjects brought forward at the meeting was that of differential duties, and is one that merits your careful consideration during the present year.

There was a considerable balance of the funds subscribed towards the Paris Exhibition Fund, and it was decided that, after reserving a small sum to meet any future liabilities, the remainder should be uti- lised for advertising our tea and coffee. It is now proposed that a portion of this sum should be handed over to the Indian Tea Associa- tion who are about to open a tea establishment in one of the best parts of Paris. The U. P. A. S. I. have been asked to guarantee one-third of the expenses in connection with this shop, the I. T. A. paying two-thirds.

Bounty on Green Tea.—The Indian Tea Association has decided to offer a bounty of $1\frac{1}{2}$ annas per lb. on shipments of green tea sent direct from India to America. The conditions under which this bounty is obtainable have been previously circulated.

Paris Exhibition.—The Indian Tea exhibit at the exhibition seems to have met with considerable success, but whether the good impression that Indian tea has produced will have a lasting effect remains to be seen.

As you are already aware the exhibit sent by this Association

received honorable mention. Let us hope that our tea may receive a higher award at any future exhibitions to which it may be sent.

Travellers' Bungalow.—Messrs. Jopp & Sealy have been deputed by Government to submit plans and estimate for a travellers' bungalow to be erected on a suitable site in Peermaad, but I have not heard whether the same have been submitted.

Cattle Trespass.—H. H. Government regretted their inability to introduce a Cattle Trespass Act on the lines of the Ceylon ordinance, but promised to give the Association's proposals their consideration when the present Act is brought up for reconsideration.

Cattle-grazing Rules.—H. H. Government have agreed to modify para. 1 of these rules as published on 16th December, 1899, thus allowing planters to import 500 head of cattle, free of tax, but no notice to that effect has as yet been published in the Government *Gazette*.

Game Laws.—Our endeavours to induce Government to introduce a licensing clause into the Game Preservation Regulation have so far proved futile. Until guns and game licenses are made compulsory, the game laws are practically useless.

Rifle Corps.—The British Resident has formulated certain rules for the working of rifle clubs and has forwarded same to the Madras Government who, in turn, have forwarded them to Government of India for approval and sanction.

Ammayanayakanur Agency.—Mr. Kriparam Singh was appointed Association Agent in August last, from which date the Shoranoor agency ceased. The agent, however, says several members are still making use of other agents for getting up parcels, etc. If such be the case, I fail to see the use of the agent.

H. E. The Viceroy's Visit.—We can only regret that time did not permit of H. E. the Viceroy visiting this district and the Peryar works on his recent tour in South India, and also that his time was so fully occupied as to prevent him from receiving an address from the planters of Travancore.

Railways.—The first Railway in Travancore is now in course of construction, and it is to be hoped that others will soon follow, more particularly one to the foot of these hills; but at present H. H. Government do not see their way to undertake the preliminary survey asked for.

Roads and Communications.—Although the district roads, as well as the main road down the Ghaut, have much improved, the road from Moondahyam to Cottayam still leaves much to be desired. During the monsoon it was in such a state that it was only with the greatest difficulty a bandy could get along it. Several new diversions have been made and will require to be thoroughly well metalled if they are to remain in good repair. While these diversions have been in course of construction, the old part of the road seems to have received but little attention. The worst part of this road is, I believe, from 7th to 13th mile. Along this portion there is no side drain at all. The mud scraped off the road from time to time has been heaped in such a way to act as a drain, only to be washed away again by the first shower. I recently forwarded to the Chief Engineer a petition signed by over 100 cartmen in which they complained of the state of this road, but have received no acknowledgment of its receipt, although sent over a month ago.

Several bridges still remain to be completed. Why they should take so long to build is a mystery.

His Highness the Maharajah has sanctioned Rs.52,400 for reconstruction of the Peryar bridge, and it is to be hoped that this sum will not be spread over a series of years as is so often done with large works in the Travancore Public Works Department. I feel sure that many of the large engineering firms in the Madras Presidency would be only too glad to tender for such works were they asked to do so; and were the Government to adopt such a course, I think they would find it as advantageous to themselves as it most assuredly would be to the public.

Never has a year passed that this Association has not found it necessary to draw the attention of Government to the state of the roads either in or leading to the district. Were the Chief Engineer and some of the principal officials of the State to visit this district more frequently than they have done in the past, it would, I feel sure, be beneficial to all, for they would then be able to see for themselves the requirements of the district which is yearly increasing in importance, and the produce from which will more than double itself in the course of the next two or three years.

Covered Landing Stage at Cottayam.—This has not as yet received the sanction of H. H. Government. The need for such a landing stage is as great, if not greater, now than when we first asked for it two years ago, and I would suggest that it be again brought to the notice of Government.

Telegraph Subsidy.—The agreement entered into between this Association and H. H. Government expired on 25th April, 1899, and it was, therefore, with much surprise that a communication from the Dewan was received requesting payment of our share of the subsidy for year ending 31st March, 1900. This letter was followed by another to the effect that, if the Association was not prepared to renew the agreement, Government would ask the British authorities to discontinue the Peermaad line. After corresponding with the Dewan, the British Resident and Director-General of Telegraphs with a view to obtaining (*a*) a reduction in the cost and maintenance, and (*b*) fuller details of revenue and expenditure, but without result, you will be asked to-day to decide whether the agreement is to be renewed for a further period of five years. During the next five years our liability may possibly be less, as it has been proposed to open a combined Post and Telegraph Office at Kanjerapalli, the net proceeds of which will be credited to the Travancore Durbar.

Membership.—Twenty estates have been borne on the rolls of the Association with a total cultivated area of 6,661 acres, of which 6,439 acres are under tea and 222 acres under coffee cultivation.

Finances.—The accounts have been audited by Mr. E. Latter and are laid on the table. The expenditure for the year amounted to **Rs.2,116-4-0** inclusive of the subsidy paid to the Government Medical Officer and leaves a balance of **Rs.91-6-9** to be carried forward.

In accordance with the resolution passed at the General Meeting held on 12th May, 1900, **Rs.250** standing at credit of the Cheroot Fund was paid to the Travancore Branch of the Indian Famine Charitable Relief Fund through Mr. H. D. Deane.

In conclusion, I wish to tender my best thanks to the Committee, more especially to the Chairman, for the valuable help they have always so willingly given me, and to you, gentlemen, for the honour you have done me in intrusting to me the duties of Honorary Secretary during the past two years.

(Signed) A. E. VEALE,
Honorary Secretary.

The Hon'ble Mr. G. L. Acworth proposed that the report be adopted and the accounts passed. Seconded by Mr. H. D. Deane. Carried *nem. con.*

Rifle Clubs.—Read and recorded correspondence on the subject.

The Honorary Secretary was requested to circulate Madras G. O., No. 1137, dated 3rd November, 1900, for information of members.

Cardamoms.—The Honorary Secretary informed the meeting that the Cardamom Hills and Kanan Devan Planters' Association had declined the invitation sent them after the last meeting asking them to come to Peermaad and discuss the Cardamom policy of Government with a view to a satisfactory settlement of the points at issue.

Telegraph Subsidy.—Read and recorded correspondence with the British Resident, the Dewan, and Directer-General of Telegraphs.

The meeting having gone into Committee, after some discussion, the following resolution was proposed by Mr. R. S. Imray and seconded by Mr. G. N. Thomson:—"That this Association regrets, owing to the serious depression in the Tea industry, its inability to guarantee the present very heavy telegraph subsidy, and would, at the same time, point out that the general public, apart from the planting community, is benefited by the line without being called upon to contribute thereto."

The resolution on being put to the vote in general meeting was carried unanimously.

Tea Pests and Blights.—Read and recorded with satisfaction letter from Dr. Watt addressed to Hon'ble Mr. Acworth to the effect that he would visit this district either in March or April, provided he could obtain the sanction of the Government of India to his doing so.

London Dock Charges.—Read and recorded letter from the Chairman, U. P. A. S. I., giving cover to copy of a letter from Mr. H. M. Knight. Read and approved Honorary Secretary's letter, No. 19, dated 25th December in reply. The Hon'ble Mr. Acworth pointed out that Mr. Sanderson was the accredited representative of the U. P. A. S. I. on the London Chamber of Commerce. Such being the case, he was at a loss to understand Mr. Sanderson's refusal to give evidence before the Royal Commission now sitting.

Tea Cess.—Read and recorded correspondence.

Proposed Tea Establishment in Paris.—Read and recorded correspondence.

Proposed by Hon'ble Mr. Acworth and seconded by Mr. Veale:—"That this Association, whilst sympathizing with the coffee-planters, considers that the U. P. A. S. I. should not allow its name to be used as a guarantee for funds, other than those accruing from the Paris Exhibition, for the purpose of pushing tea, coffee, cinchona, or any other product in foreign markets. Carried *nem. con.*

Cart Rates and Cart Loads.—After considerable discussion, the following resolutions were proposed by Mr. G. N. Thomson and seconded by Hon'ble Mr. Acworth and carried unanimously:—"That the Honorary Secretary do instruct all Cottayam agents that the rates for carts plying between Cottayam and Peermaad will be 1½ annas per mile for full and ¾ annas per mile for half hire from November 1st to May 31st, and from June 1st to October 31st at 2 annas and 1 anna per mile for full and half hire, respectively."

"That loads be fixed at 5 full chests down and not less than 800 lbs. up."

The above resolutions to take effect from 15th February, 1901.

Land Tax.—Proposed by Mr. Leahy and seconded by Mr. Laurie: "That owing to the extreme depression in our staple industry, and to the falling off in consumption of the product, H. H. Government be respectfully approached with a view to a reduction in the tax of uncultivated lands." Carried *nem. con.*

Rule 4.—The amendment, as suggested by the Committee not meeting with general approval, was withdrawn.

Association Subscription.—Resolved "That the subscription for the current year be fixed at 2 annas per cultivated acre for the Association and at 3 annas for the Medical Fund."

Mr. Thomson proposed and Mr. Veale seconded "That a hearty vote of congratulation be sent to Mr. G. T. Mackenzie on his appointment as Britsh Resident in Travancore and Cochin.

Election of Officers.—The ballot resulted as under:—

Hon'ble Mr. G. L. Acworth, *Chairman.*
Mr. R. S. Imray, *Vice-Chairman.*
Mr. W. H. G. Leahy, *Honorary Secretary.*
Mr. H. M. Knight, Mr. B. Laurie, } *Committee.*

Votes of Thanks.—The Hon'ble Mr. G. L. Acworth, in proposing a vote of thanks to the retiring Honorary Secretary, said:—"I have the permission of your Chairman to carry out a duty, and I am sure you will all agree with me that it is a very pleasant duty. It is to propose a very cordial vote of thanks to our retiring Honorary Secretary. Mr. Veale. You all know how hard Mr. Veale has worked in our interest, but nobody who has not carried out the duties of an Association Honorary Secretary knows how very hard a tax the work is, if it is to be carried out efficiently. Mr. Veale has carried out his work most efficiently; he has spared himself neither time nor trouble, whilst his letters have been models of courtesy and lucid argument. I think you must all have been struck with them, as also with the businesslike manner in which he has transacted his business: in fact, Mr. Veale has brought up this Association to a point of perfection which is, I think, attained by very few District Associations in South India. I am sure I may say for you all that we thank him most heartily for what he has done for us; that we wish him a pleasant time at home, and a safe return to this country."

Seconded by Mr. Leahy and carried with acclamation.

Mr. Veale briefly replied thanking Mr. Acworth for the complimentary terms in which he had proposed the vote of thanks and the Association for the cordial manner in which they had carried it.

Mr. Veale proposed a hearty vote of thanks to Mr. Leahy for the efficient manner in which he had conducted their meetings. Carried with acclamation.

The meeting then terminated.

The following papers were laid on the table:—

Late Honorary Secretary.

MARKET REPORT.

[*Per Mail advices of 4th January* 1901.]

COFFEE.

The London Commercial Record says:—The public market continues closed and auctions will not be resumed till the 8th instant. There has been scarcely any demand privately and no sales have been reported, so that quotations are nominally unaltered. In the market for "futures" there has been slight fluctuations, but the general tendency has been to rather higher prices. No auctions to-day. We quote:—

London ...	Santos ...	March delivery	... 32s 3d.
New York	... No. 7 Rio...	„	... 5·85 cents.
Hamburg...	... Santos	„	... 32 pf.
Havre	... Santos ...	„	... 39¼ francs.

Imports, Deliveries and Stock of Coffee in London, are as follows:—

	Stock.		Imports.	
	1900.	1899.	1900.	1899.
Tons ...	14,988	14,641	35,534	46,307
	Home Consumption.		Export.	
	1900.	1899.	1900.	1899.
Tons ...	16,566	16,787	18,627	29,270

	Tons.
The preceding figures exhibit—	
In the Imports a decrease this year of	10,773
Home Consumption a decrease of	221
Export a decrease of	10,643
Stock a decrease of	347

Rio Exchange 9 3/32d, previous day —d.

HAVRE, *Jan.* 3.—Good average Santos January opened steady at 38¾f. and closed quiet at 39¼f.; March opened at 39f. and closed at 39¼f., May opened at 39¼f. and closed at 39½f., September opened at 40f. and closed at 40¼f., December opened at 40¼f. and closed at 40½f.

HAMBURG, *Jan.* 3.—Good average Santos January opened steady at 31½pf. and closed quiet at 31pf., March opened at 32pf. and closed at 32pf., May opened at 32½pf. and closed at 39½pf., September opened at 33¼pf. and closed at 33pf, December opened at 33¾pf., and closed at 33½pf.

NEW YORK, *Jan.* 3.—Closing prices of No. 7 Rio were as follow:—

	Jan.	Feb.	Mar.	April.	May.
January 3...	5·65	5·75	5·85	5·90	5·95
January 2...	5·70	5·80	5·90	5·95	6·00

TEA.

INDIAN.—Business was resumed after the holidays on the 2nd instant when 24,500 packages were brought forward against 37,900 packages in the first week of 1900.

There was a fair all-round inquiry for useful descriptions on the basis of rates current at the closing sale of last year but the easier tendency on common. Quality generally was of an ordinary character, and at present fewer autumn flavoured parcels than usual have come forward, though several now catalogued.

For 22,100 packages on Estate Account 7⅛d per lb. was obtained, compared with 8d per lb. for 33,600 packages, and 8⅝d per lb. for 27,400 packages in the two preceding seasons.

It is satisfactory to note that deliveries are going on well, those for December being 12,345,000 lbs. versus 11,311,000 lbs. in 1899. Also that although for the six months ending 31st ultimo they were disappointing, owing to the heavy Customs payments prior to the advance on the duty in March, taken from 1st January to 31st December they totalled 144,704,000 lbs. whereas for the whole of 1899 they only reached 140,481,000 lbs.

CEYLON.—The market reopened on Tuesday with an auction comprising 21,700 packages opposed to 24,700 packages for the corresponding period in the twelve months before.

A good deal of irregularity in quotations was apparent, and on the whole inferior kinds passed in favour of buyers. Medium grades for the most part met a steady demand, but finest, though sparsely represented, occasionally received less attention.

The average is slightly over 7d per lb. On the 20th December, it was 7⅛d per lb. and 7¾d per lb. in 1899.

Clearances from the London Bonded Warehouses seem to have been favourably affected by the depressed prices existing for some time past, the amount withdrawn from 1st to 31st ultimo being 7,932,000 lbs making for the year just concluded 105,931,000 lbs. in contradistinction to 94,226,000 lbs. in 1899.

JAVA.—Rather more than 900 packages of direct import were submitted. The upper lines went without material alteration but there was a weaker feeling for the lower ones. For next Thursday 2,100 packages are advertised.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns are, *viz.*:—

From 1st to 31st December,	1900	16,302,079 lbs.
Do. do.	1899	15,615,813 ,,

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	22,367	2,114	24,481
Ceylon	19,783	1,926	21,709
Java ...	643	295	938
Total ...	42,793	4,335	47,128

Also 27 packages from second hands.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon and Java Tea Report, dated January 4th, 1901, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1900-1901	931,505	739,562	30,528
1899-1900	1,002,651	710,767	33,875

25,138 *pkgs.* INDIAN
22,034 ,, CEYLON
938 ,, JAVA
} Total 48,110 packages were offered in public auction this week.

Duty last month was paid upon 16,302,079 lbs. of Tea, against 15,615,802 lbs. during December, 1899. This is the first instance since the declaration of the Budget in March last that the *duty payments* have shown an increase over the corresponding period of the previous year. It is therefore possible that the large quantity of Tea cleared in anticipation of the Budget may now be nearly worked off, and that figures may shortly assume their normal condition.

There is a strong feeling amongst some of the larger Indian and Ceylon Tea producers, that in view of the over-supplied condition of the market, it would be advantageous to resort to finer plucking during the coming season, with the double object of reducing the supply and improving the quality of the crop.

INDIAN.—The market re-opened with a small sale, comprising 25,138 packages; prices, except for commonest descriptions, showed little change from those ruling before Christmas. The Official wire gives exports to U. K for second half of December as 7,260,000 lbs., against 6,200,000 lbs., making the total from the commencement of the season to the 31st December, 144,690,000 lbs, against 135,992,000 lbs. same period 1899.

Week's average of Tea sold on Garden Account 1901, 21,718 pkgs., av. 6·89d. 1900, 33,972 pkgs., av. 8·07d.

Total Tea sold on Garden Account 1st June 1900 to date, 757,770 pkgs., av. 7 58d. 1900, 761,858 pkgs., av. 8·47d.

CEYLON.—The opening sale passed with slightly easier prices for poor liquoring Teas, other grades remaining at about previous quotations, except that there was rather more enquiry for Teas of really good quality. The Official telegram gives exports to U.K. for December as 11,250,000 lbs., against 11,000,000 lbs. in December, 1899, and estimates quantity for January as 10 to 10½ millions, making the exports from 1st January to 31st December 114,500,000 lbs., against 103,500,000 lbs. in 1899. Average for week 7·07d, against 7·76d in 1899.

Ceylon Tea sold on Garden Account 1st January to date, 18,387 pkgs., av. 7·07d. 1900, 25,413 pkgs., av. 7·76d.

JAVA.—938 packages were brought to auction representing Invoices from six Estates. The sale passed somewhat slowly at rather easier prices, several parcels being withdrawn.

COCOA.

The market is quiet, operators generally awaiting the auctions of Tuesday next. Private transactions include greyish red Trinidad at 68s, fair to good Grenada at 68s to 70s, fermented Dominica at 66s to 69s and Ceylon at 80s to 82s per cwt.

PEPPER.

BLACK is dearer. About 100 bags fair Singapore sold on the spot at 6¼d for fair, also some Tellicherry at 6¼d. For arrival about 100 tons sold—January-March and March-May (s.) at 6$\frac{7}{16}$d to 6$\frac{9}{16}$d per lb.

WHITE is also rather higher. Singapore on the spot selling at 9¼d, Penang at 8½d to 8$\frac{9}{16}$d, and to arrive at 9$\frac{9}{16}$d and 8$\frac{13}{16}$d per lb. respectively for February-April shipment.

CINCHONA.

To the Amsterdam auctions to be held on January 10, 1,170 bales and 27 cases have been added, so that the total amount to be offered on that date is now 7,275 bales and 212 cases, weighing 657,316 kilos. The shipments from Java during December amounted to 1,091,000 Amsterdam lbs.

The exports from British India for *six* months ended September were:—

	1900.	1899.	1898.
Lbs....	1,525,617	1,379,508	818,283

The exports from Holland for the ten months ended October were:—

	1900.	1899.	1898.
Kilos.	4,002,000	4,712,000	4,050,000

QUININE.

QUININE has been a dead letter on this market, and not a single transaction has been reported; prices are, therefore, nominal. The nearest spot price is 1s 1¼d, with sellers of March at 1s 1d and May at 1s 1½d. At the auction of quinine held in Batavia on December 28, 3,900 kilos. Ed. II. were sold at the equivalent of 19fl. per kilo. (against 22fl. paid at the November auctions), while Ed. III. was bought in. The next auction will be held on January 16.

PLANTING OPINION.

A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VI.] MADRAS, SATURDAY, FEBRUARY 2, 1901. [No. 5.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 8th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

Munzerabad. *January* 22*nd*, 1901.—*Crop*—Progressing very slowly from there being so much white fruit. *Blossom*—On most estates a small blossom of about ½ a cwt. an acre has been out since Monday : some estates have had much more. We shall have to be prepared to pulp in September, or by the 1st of October this coming season. *Labour*—Abundant. *Health*—Good.

THE POSITION OF THE TEA INDUSTRY.

SINCE writing last week on "Tea—Supply and Demand," we have received a copy of a circular issued by the Indian Tea Association dealing with the subject of the Position of the Tea Industry. This circular is reprinted in our U. P. A. S. I. section, and copies have been circulated by the Secretary, U. P. A. S. I., to the various District Planting Associations in Southern India. From one point of view, it seems a pity that the members of the Committee of the I. T. A. should not have expressed their own opinions more definitely. Possibly, however, they wished to avoid any appearance of a desire to dictate to planters, or even bias their opinions, and as they have to deal with a few planters in the South, with whom they are not in touch, as well as a good many in the North, whose feelings they may be in a position to gauge ; this cautious procedure may be wise. Their statement of the position and of the main remedies suggested is not quite the same as that which we gave last week, though, as far as it goes, it is sufficiently near to our statement to call for little special comment. The suggestions they put forward for consideration are, in addition to that of Mr. Rosling (Ceylon) :—

(*a*) The temporary abandonment of 10 per cent. of the area in full bearing.
(*b*) The fixing of a date for the closing of manufacture in each district.
(*c*) Generally finer plucking.
(*d*) That a percentage of the crop, consisting of low grade teas, should be placed at the disposal of the Indian Tea Association to be utilised for encouraging the consumption of tea among the Natives of India.

Though slightly different in detail from the proposals alluded to in our last, they have the same general characteristic, in that the successful application of any one of them would involve a practically unanimous agreement among Indian and Ceylon tea-planters. To our mind, they would involve even more, for we should have no faith in such an agreement unshared by tea cultivators in China and Japan.

On two points, at least, we are in full accord with the General Committee of the I. T. A. : "(1) It seems clear that any action, to be effective, must be adopted, and carried out simultaneously, by Indian and Ceylon growers. Diminution of production by India alone, or by Ceylon alone, would merely mean the transference of a portion of the trade from one to the other without any rise in prices ; (2) But the circumstances and conditions of the industry, not only as between India and Ceylon, but even as between the different tea-producing districts of India itself, are so diverse as to render effective combination peculiarly difficult." To our eyes this extreme difficulty amounts to an impossibility, but it will be interesting to note what opinions are expressed by the Planting Associations concerned and by any individual planters who may express their personal opinions without reference to those of Associations. We would also lay stress on the fact that Proprietors and Agents are invited not merely to state what they think of the suggestions put forward, but also to make any other proposals and to offer any remarks they may think appropriate. A wide field of discussion is thus opened. Practically, a *plébiscite* of planters' opinions is opened, and while the I. T. A. does not promise to commit itself to the opinion of the majority or of any section or individual, it obviously intends to

give deep consideration to a matter that is felt to be of vital moment to the Tea industry.

As often occurs in such cases, a point not touched upon by the circular is perhaps as important as any with which it deals. The absence of reference to China and Japan is remarkable. It appears to be assumed that India and Ceylon can fix the prices of their own teas without reference to the competition of China and Japan. That we differ from this view, has been shown in our previous remarks on the subject. Whether we deal with fine teas or coarse, with black or green leaf, we have to take Far Eastern rivalry into consideration. Not more than a few weeks ago, the London *Daily Mail*, which had, but a short time earlier, staunchly advocated the claims of British-grown teas, alluded to a certain blend of China leaf (consumed by her late Majesty Queen Victoria) as the finest in the world. It is clear from this that India and Ceylon have not yet convinced the world that the finest teas are to be had alone from them, or one of them. As for coarse sorts,—well, we do not suppose that any planter will deny that the competition of China should not be lost sight of, or that if Indian and Ceylon prices are raised a considerable demand for inferior leaf will be diverted from British teas to those of the Celestial Empire. If, then, coarse and fine teas would probably be affected by an enhancement of price such as is now under discussion, what about mediums? It can scarcely be urged that a different law applies to them, or that the circumstances affecting consumption are so entirely different as to preclude mediums from feeling the effect of prices that would influence both fine and coarse sorts. If our view be right, any scheme of reducing production must fail so long as India and Ceylon act without the co-operation of China and Japan. We doubt if a sufficient approach to unanimity can ever be attained on the part of British growers; we are sure that no such unanimity would be of permanent benefit to them if these competitors pushed ahead with production, at the same time pushing demand.

U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

The Demise of Queen Victoria.

The Chairman of the United Planters' Association of Southern India (Incorporated) has despatched the following telegram to H. E. the Viceroy :—

"This Association desires to convey through Your Excellency its heartfelt sorrow for irreparable loss sustained by the death of our beloved Queen and respectfully to express deepest sympathy with the Royal Family in its bereavement."

* * *

A Circular of the Indian Tea Association, Calcutta, under date 17th January 1901, issues the subjoined papers upon this subject for information.

No. 36-1901, dated Calcutta, 9th January 1901.

From—THE SECRETARY, Bengal Chamber of Commerce,

To—THE SECRETARY, Indian Tea Association.

Prospects of Indian Tea in Russia.

I am directed by the Committee of the Bengal Chamber of Commerce to forward, for the information of the General Committee of the Indian Tea Association, copy of an interesting letter, dated 29th November, which they have received from Major G. Chenevix Trench, Her Britannic Majesty's Consul in Seistan, communicating the purport of an interesting conversation which Major Chenevix Trench has had with the Russian Vice-Consul in Seistan on the subject of Indian tea.

It will be seen from the letter that the Russian Vice-Consul having tasted some Indian tea which Major Chenevix-Trench had received, and which had been bought in Calcutta at 14 annas per pound, remarked that if such flavoured tea could be sent to St. Petersburgh by the Seistan route, and not by sea, he was sure it would fetch a good price and very soon oust Chinese tea in Moscow and St. Petersburgh. The price of tea in Russia is apparently governed by the mode of its transit to that country, as there appears to be a prejudice against teas transmitted by sea, the idea being that the flavour was spoilt by the sea route. The information given appears to be of importance to the tea trade, and your Committee will, no doubt, see their way to make use of it. I shall have much pleasure in passing on any further communications I may receive from Major Chenevix-Trench as the result of the reference which the Russian Vice-Consul has made to St. Petersburgh and Moscow.

No. 202, dated Seistan, 29th November, 1900.

From

MAJOR G. CHENEVIX-TRENCH,
Her Britannic Majesty's Consul,

To

THE BENGAL CHAMBER OF COMMERCE,
Calcutta.

I had an interesting conversation with the Russian Vice-Consul here on the subject of Indian tea. As he is a man well versed in Russian trade and taste, I send you the purport of the conversation in order that you may circulate it among the tea growers connected with your Chamber.

The Russian Consul said he would like me to taste some Chinese tea, which he had bought in Petersburgh for 4 roubles a lb., which he said was considered good tea there. though by no means tea of the highest price obtainable. The speciality he said of this tea was that it had never crossed the sea. Russians, he said, always thought that the sea ruined the flavour of tea and consequently those that could afford to pay a good price, asked always for tea which had come from China by the land route. I tasted the tea and found that it was not nearly as good as some I had recently received from a friend in Calcutta. This opinion was equally shared by the Russian Consul, who was amazed at my telling him that the tea I gave him to drink was bought in Calcutta at 14 annas a lb. He at once remarked that if such flavoured tea could be sent to Petersburgh by the Seistan route, and not by sea, he was sure it would fetch a good price, and very soon oust Chinese tea in Moscow and Petersburgh. He said that the price of tea in Russia was almost entirely governed by, whether it had come by land or sea, quite independent of the obvious extra cost of land-borne tea. The Russian's desire for land-borne tea amounted to a prejudice. He at once agreed to send samples of my tea to Petersburgh, Moscow, and his Customs Officials, who always had expert tea tasters in their employ. I shall naturally inform you of their opinion. In the meanwhile I have thought that this information might be made use of independently of the Russian Vice-Consul's action by Indian tea growers.

* * *

Indian Tea Exports.

The General Committee of the Indian Tea Association Calcutta, have issued under date 17th instant, their Monthly Return of Sailings and Daily Customs Entries of Tea from

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nicholson's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf people unable to procure the Ear Drums, may have them free.

Address—No. 989 D, THE NICHOLSON INSTITUTE,

* It is understood that the bulk of this tea consists of transhipments for the United States and Canada.

* * *

At the request of the Indian Tea Association, Calcutta, copies of the following circular, dated 19th ultimo, and addressed to all Proprietors and Agents of tea estates, have been forwarded to the various District Planting Associations in Southern India :—

Position of the Tea Industry.

I am directed by the General Committee of the Indian Tea Association to draw your attention to the following telegram, which they have received from the Committee of the Association in London :—

"Movement initiated to curtail output 10 per cent. India and Ceylon. Would a proposal be entertained? Urge the matter forward all you can."

2. The Committee think all Proprietors and Agents will agree with them that, in view of the present position of the industry, action designed to curtail the output of tea, and consequently to enhance prices, is most desirable.

The Committee, consequently, are not at present prepared to submit to the Indian industry any particular scheme, the adoption of which would, in their opinion, bring about the desired end. They rather feel the subject to be of such great importance as to make it necessary for them, in the first instance, to consult Proprietors and Agents generally respecting it. In doing so they would draw attention to the annexed copy of a letter which has been lately addressed by the Chairman of the Ceylon Planters' Association to a Ceylon newspaper. Mr. Rosling has there put forward certain proposals, the adoption of one of which might, he thinks, reduce the output of tea by the required amount. Somewhat similar suggestions have reached the Committee from other sources; and upon these they would be glad to receive the opinions of all Proprietors and Agents. The suggestions are :—

3. I am therefore now to ask you to favour the General Committee by an early date with your opinion as to whether any one of the foregoing proposals, or any combination of them, is practicable. And, further, whether you consider any one of them to be such as is likely to meet with the support of a large majority of Tea growers. I am also to suggest that, should you have other proposals to make, you should communicate them to the General Committee, together with any remarks on the subject generally that you may think well to offer.

Copy of a letter, dated 29th December 1900, *from the Chairman, Ceylon Planters' Association, to the Editor of the* Times of Ceylon.

It is generally admitted that the present position of the Tea Planting Industry is, owing to over-production, very unsatisfactory; and unless some action is taken to curtail supplies, we must see the painful and prolonged process, "the survival of the fittest," gradually force some of the poorer properties out of cultivation.

This process must necessarily be a prolonged one, as there are many estates which can just pay their way, and which will continue to produce so long as there is no actual loss.

It has been suggested by certain gentlemen, amongst others, Mr. A. Thomson, of Messrs. Whittall & Co., that, in view of the enormous quantities of tea being produced, we should endeavour to form a combination by which the requirements of the various markets may be met without making any one of them the dumping ground for our surplus crops.

It is necessary that any steps taken by Ceylon should receive the full support of India, otherwise curtailment of shipments from here would merely allow of increased exports from Calcutta.

The three possible methods suggested for reducing our crops are—

(1) Finer plucking, which would tend to reduce the output whilst giving a better quality of tea.

(2) Making a certain percentage into green teas.

(3) Resting a certain percentage of the acreage in bearing.

The objection to No. 1 is that we should probably have too much fine tea produced, with a corresponding fall in its value, and

directly the better and poorer classes of tea approximated in value there would be a tendency to pluck coarse again.

The objections to No. 2 are (*a*) the green tea market is not as yet sufficiently developed to afford material relief; and (*b*) the difficulty of making both black and green teas in the same factory.

The advantages of No. 3 are that, if you do not pluck a field for a certain number of months, you rest your bushes, and you can hardly bring them into plucking again without pruning, thus doing away to a certain extent with a possible temptation to break out of the combination. The net result would be a reduced yield and improved bushes.

I propose that all estate proprietors or their agents in Ceylon and India be asked to rest 10 per cent. of their acreage in bearing for two years from the 1st April 1901 to 31st March 1903 This arrangement to be subject to *at least* 80 per cent. of the acreage in both countries agreeing to it in writing.

An arrangement such as this should ensure a reduction of from 15 to 20 million lbs., and I feel convinced that with this quantity taken off the market, the rise in price would more than compensate for the amount of leaf lost.

At the end of two years, the green tea market should be largely developed, and in the black tea market consumption may have once more overtaken production.

Yours, etc.,
EDWARD ROSLING.

NOTES

Coffee. Reuter states that Stocks in London amount to 14,891 tons. Fortnight's landings, 900 tons ; deliveries, 1,300 tons.

Cheap Coffee. Coffee begins to look very cheap, says the *American Grocer*, adding, "It is always safe to buy ahead of requirements when prices are abnormally low."

Cocoa in Ceylon. Mr. P. D. Young writes to the *Times of Ceylon* :—"Cocoa has done very well on this place (Woodthorpe, Katugastota): 125 acres gave me 336 cwts., and I hope to get 350 this year besides tea and cocoanuts."

Calcutta Tea Sales. On the 24th ultimo there was a small sale, only 10,000 packages being offered. There was brisk competition, prices all round showing a slight advance ; 5½ per cent. more tea was shipped to Great Britain ; 17¼ per cent. more to Australia ; while the shipments to America show a decrease of 9½ per cent. to date.

Artificial Manures poisoning Vegetables. Dr. F. W. Koeler writes to a Colombo paper :—"I beg to inform you that Cabbages and Turnips, manured with superphosphates, are surely poisonous ; and I estimate the quantity of cabbages or turnips which should empoison a man to be at least *one ton* daily." It seems fairly safe, after all !!

Retirements. A Ceylon paper announces that Mr. F. G. A. Lane, Proprietor of Blair Athol, and ex-Chairman of the P. A., is not returning to Ceylon, and that Mr. A. Melville White, another ex-Chairman, is also shortly leaving for good. Both these gentlemen were high up on the list for nomination as Planting Member of the Legislative Council.

London Tea Sales. On 24th ultimo, according to Messrs. Gow, Wilson & Stanton's report to Colombo, 26,000 packages Ceylon Tea were sold out of 28,000 offered. The average price realised was 7% which shows advance of ½d. Fine teas were firm, and, in some cases, dearer, and generally full rates were realised. Of Indian Teas 52,000 packages were offered, and 47,000 sold average price 7d.

The Over-production Question. The London correspondent of the *Times of Ceylon* cabled on the 24th ultimo :—The resolution passed at the meeting of Indian and Ceylon tea producers on Wednesday was expressed in general terms ; but the meeting favoured the reduction of output on the basis of acreage, and left Ceylon to say whether it wishes the intervention of Government or a voluntary scheme

Colombo Tea Sales. On the 23rd ultimo the market generally was firm, but very irregular common leaf teas being if anything somewhat firmer. Quality continues to improve, says the *Times of Ceylon*. After 1-30 p.m. the sale was postponed until 10-30 a.m. next day Messrs. Forbes & Walker's large lots only were dealt with The feeling in the room was gloomy, owing to the death of our beloved Sovereign, so keenly and individually felt.

Ceylon Tea in the United States. *Apropos* of the desire to push Ceylon and Indian tea in foreign markets, and especially in the United States, it may interest our readers to learn that Mr. R. V Webster lately made an extensive tour through the States When in Ceylon recently, he remarked, "unless there is some change in the methods of the present tea campaign in that country I would strongly recommend all Ceylon firms to leave that market alone."

Research Work in Ceylon. "At Hakgala, we have just learnt," a Nuwara Eliya correspondent writes to the *Ceylon Observer*, "that a laboratory is being built at the Gardens with a special view to Research Work being carried on *there*, as well as at Peradeniya, by Professors who come out to Ceylon for that purpose. Rooms are also to be put up adjoining the laboratory for the scientists to stay in. So far only the timber is being felled ready for the building but they hope to have the work in hand shortly."

Pepper in 1900. The price of pepper, says the *Chemist and Druggist*, has varied within narrow limits throughout the year, but the tendency has been upwards owing to the continual diminution of stocks throughout the world, caused by the shipments from the countries of production still falling short. Singapore black, which at the beginning of the year was worth $5\frac{3}{4}d.$, is now quoted $6\frac{5}{16}d.$ White pepper is only fractionally dearer Penang being $8\frac{9}{16}d.$ against $8\frac{3}{8}d.$ this time last year.

Seeing other Districts. Mr. Robert L. Proudlock, Curator of the Government Botanic Gardens Nilgiris, has been visiting Ceylon lately. Mr. John Cameron Superintendent of Mysore Government Gardens, lately proceeded to Calcutta *en route* to some of the Government Gardens in Bengal and the North. May both gentlemen return primed with fresh knowledge in regard to planting products and other matters. Both are fully competent to take advantage of opportunities such as their travels will certainly have afforded them.

Sericulture in Brazil. The Brazilian Government offer the following prizes for sericulture :—

One of 20 contos, one of 10, and three of 5 contos de reis each, o silk worm breeders resident in this State, who, within the pace of two successive years, shall present to the Secretary f Agriculture, and prove the production of the best and argest quantity of spun silk from the worm. One of the onditions is that no one is qualified to compete, who cannot prove to have invested an amount at least equal to the prize competed for, in plant and stock.

The Twentieth Century.

Thus the *American Agriculturist:* —Let your face be to the future. The old century is gasping its last. Wonderful as it has been, every thoughtful man and woman believes that the twentieth century will be still better and grander. Preparation for the present and for the future should now concern us. Let the dead century bury its dead—it is the living, the new century with which we now have to deal. It will offer better opportunities for every man, woman and child now living than was the case with our ancestors 100 years ago. Our duty is not to mourn "for the old days," but to adapt ourselves to the onward march of civilization and the steady advance of progress.

The Planters' Association of Ceylon.

The Annual General Meeting will be held at Kandy, on Saturday, the 16th instant. The following are the contents of the agenda paper :—(1) To receive the annual report; (2) to elect a Chairman, Secretary, and Committee for the ensuing year ; (3) to receive the report of the "Thirty Committee," (4) to appoint 24 members of the Planters' Association of Ceylon to serve on the "Thirty Committee" for 1901 ; (5) to appoint a Committee to manage the affairs of the Labour Federation of Ceylon for the year 1901 ; (6) to appoint a Cacao Committee of the Planters' Association of Ceylon ; (7) to receive abstract of accounts of the Planters' Benevolent Fund for the year 1900 ; (8) to consider the question of a reduction of railway rates.

Amsterdam Bark Sales.

At the auction of cinchona held at Amsterdam on the 10th ultimo, 7,275 bales and 212 cases were offered containing 30,935 kilos. quinine sulphate, or an average percentage for the manufacturing-bark of 5·13 per cent., against 5·29 per cent. for the December auctions, and an average of 5·26 per cent. for the ten Dutch auctions held in 1900. Of the above 7,487 packages, 6,876 packages sold at an average unit of 7·25c. per half-kilo., against 8c. per half-kilo., paid at the December auctions. The following were the approximate quantities of quinine sulphate purchased by the principal buyers :—English and American factories, who purchased the equivalent of 9,515 kilos. ; the Brunswick factory, 6,147 kilos. ; the Mannheim and Amsterdam factories, 5,101 kilos. ; the Frankfort-on-Main and Stuttgart factories, 4,999 kilos. ; and various buyers, 2,553 kilos. The prices paid for the manufacturing-bark ranged from 4¼c. to 89c. per half-kilo, and for druggists' bark from 10c. to 103c. per half-kilo.

Tea Rooms in London.

The London correspondent of a Colombo paper writes :—"It is quite the fashion now for ladies to preside over luncheon and tea rooms. I counted no less than six afternoon tea rooms in Bond-street last week, and all those elegant and charming establishments are kept by ladies—real ladies, gentlewomen. A few years ago the only place you could possibly get a cup of tea or coffee to refresh you after a tiring afternoon of picture galleries, shopping, or having your hair shampooed, was a confectioner's shop. Now Bond-street, bristles with spacious and artistically furnished tea-rooms, where you are waited on by graceful and gracious ladies, supplied with the most dainty and delicious fare, served upon the most delicate china, and where sweet stringed music is discoursed while you sip your chocolate, or tea, as the case may be, and nibble your Neapolitan sandwiches on tiny hot crisp scones. The particularly delightful tea-house in which I was regaled last week is called "The Old Oak House." I think this afternoon-tea business most suitable for educated women, all the lady waitresses so demure and soft-footed in their pretty grey gowns, with white sleeves and aprons, are well-bred and well educated young women, and I am told are also well-paid when they prove themselves intelligent and capable."

Indian Tea.

Capital remarks :—The Indian Tea Association have addressed two lengthy letters to Government on the distressful condition of the tea industry and the need it has for assistance. In the one, it is asked that efforts may be made to reduce the duty at home from sixpence to fourpence ; in the other, that a small export duty may be levied on tea here, as is done in Ceylon, the proceeds of which may be applied in pushing the sale of Indian tea in foreign countries. What has really brought the tea industry to its present position is "Over-production" spelt large. The Currency Legislation of 1893 and the increase in duty in 1899 brought matters more speedily to a climax ; but that climax was only a question of time. A reduction in the duty will, no doubt, help things temporarily, and the creation of new markets is most desirable, but if tea-growers will deliberately ignore the laws of supply and demand, they can only blame themselves for the consequence. Mr. Wilkins Micawber summed up the situation when he submitted that an income of £1 and in expenditure of 19s. 11½d. meant happiness, inversely it is the same with supply and demand. If the former is in excess of the latter, there is trouble for the producer. No Currency Laws or Import Duties will alter this ; and we see that the Association recognizes the fact.

Coffee in London.

The *Produce Markets' Review*, of 5th ultimo, says :—Although the deliveries, stocks, etc., of the principal European and American ports on the 1st instant will not be known for a few days, the London figures are available. It will be seen that the home consumption for the year shows a reduction compared with 1899 to the extent of 286 tons. Though, not a large amount, it is unsatisfactory that there should be a falling off at all, and especially so when it is remembered that many hundreds of tons were taken during the year by the War Office for the troops in South Africa, and, therefore, the falling off in the actual home consumption is increased by the same amount. On the other hand, it should be borne in mind that the deliveries in the last two months of 1899 were increased very considerably, owing to the exceptionally low prices ruling, and that during the last four months trade has been abnormally quiet, and it is reasonable to expect that the interior stocks are correspondingly lower, and that a decidedly improved demand may be looked for during the next month or two. So far this year only a very small trade has been done, but with the recommencement of auctions on Tuesday next an

improvement may be looked for. In the terminal market only small transactions have been recorded, and quotations are practically unchanged.

Disease among Cardamoms.

Mr. J. W. Mollison, Deputy Director of Agriculture, Poona, states in a report on Cardamoms in India that in most of the Kanara gardens a so-called disease has appeared in the cardamom crops and is restricting cultivation. The affected plants do not present any particular indications of disease, but simply do not thrive. The leaves in parts become yellow and wither. The effect is that the plants have no vigor of growth. It may be taken as certain that the cardamom, like any other cultivated plant, degenerates when grown for long periods under precisely the same conditions of soil and climate and without any change in methods of propagation or reproduction. The vigour of any cultivated plant may be renewed from time to time by change of soil, change of seed, by rotation of crops and by other regenerating influences. The Kanara cardamom crops have for a long period been grown without any changes in the system of manuring, propagation, and general cultivation, and Mr. Mollison is of opinion that the diseased conditions referred to have been induced by these causes. However, within recent years, borers and grubs have caused considerable damage to the cardamom crops, and the cultivators assert as a reason, that they have been prevented by forest conservation from using for leaf-mould the leaves and twigs of certain trees containing astringent properties and incapable of harbouring insect life. To make matters worse, snakes and rats are particularly fond of the fruit of the cardamom plant."

Coffee Poisoning.

The *American Grocer* says:—The subject of poisoning from an excessive use of coffee was discussed at the last gathering of the New York State Medical Association. "Coffee," said Dr. Feszynsky, "is a cardiac stimulant. It quickens the imagination and the memory, dispels all tendency to sleepiness, and enables the user to do work of a high quality and for a longer continuous period than is possible under other conditions. In moderation, it is good. In excess, it produces all the characteristic symptoms of alcohol poisoning—namely, tremor, rapid pulse, disturbed digestion, and the depression of neurasthenia. This condition is often mistaken for a case of alcoholic poisoning. It closely resembles that, as well as the condition of the morphia fiend. Great care is necessary to avoid overlooking it, because the universal use of coffee makes it unlikely to be considered as the source of these complicated nervous symptoms." In the discussion at the State Medical Association meeting which followed the reading of Dr. Feszynsky's paper, a physician, who has devoted several years to the investigation of coffee poisoning, told of an amusing case in his own practice. It seems that he was called to attend a prominent member of the Women's Christian Temperance Union, who was very ill and supposed to be at the point of death from nervous troubles. "I found her in very bad condition," said the Doctor. "And then I found in her room a coffee-pot which supplied her with some dozen cups a day. She was drinking coffee in place of rational food and drink, and was fairly poisoned." It was the general opinion of the physicians present that two cups of coffee a day were good—and more than that a source of danger.

LETTERS TO THE EDITOR.

COFFEE.

NEW YORK, *December 31st*, 1900.

Our last circular was issued July 6th, 1900, and as regards market probabilities, we refer our readers to that circular for the reason that conditions outlined at that time have proved to be entirely correct, with the exception that the current crops in Brazil will far exceed our expectations of that time. According to the receipts in Rio and Santos up to date, and also the estimates recently received from different Brazil houses, the probability exists of the current Rio and Santos crops turning out 1,000,000 bags larger, *i.e*, instead of 8¾ to 9 millions, as we last July promised, they will reach 9,750,000 to 10,000,000 bags.

As far as *supplies* are concerned there can be no doubt that in the year 1901 they will exceed the largest figures ever known. Three years ago, when we were in the *record* crop of 10,500,000 bags—in Rio and Santos—the visible supply for the world, January 1st, 1898, was 6,357,000 bags, and allowing for some decrease during the current month of December.

The visible supply for the world, January 1st, 1901, will be fully 7,500,000 bags.

With such a difference as this we compare the prices of options in those years:—

March, 1898, Spot month in Havre sold at Frcs. 33·½.

March, 1898, Spot month in Hamburg sold at 27·½ Pf.

March, 1898, Spot month in New York sold at 4·85,

while to-day the same option is selling at fully *Twenty Per Cent. Higher.*

During the lowest prices of 1899, from July 1st, when Coffee began to run down to the lowest prices on record the visible supply for the world July 1st, 1899, was 6,200,000 Bags, and in all probability the visible supply for the world July 1st, 1901, will be much larger than it was then—so on the basis of *Supplies*, values now are far above the level of the market of the past three years, and what is most significant, the prospects of the growing crops in Brazil, without contradiction, so far, from any quarter, are the best on record, promising figures as high as 11,000,000 bags and above.

As far as *Consumption* is concerned, the ideas we expressed in our July circular have turned out quite correct. Large transfers from the seaports to the interior do not mean consumption, and cannot be taken as a sufficient guide, and all ideas such as were put forward last year, to convince people that consumption had overtaken production, must be totally dismissed. *Production* continues to exceed consumption.

Now as regards the influence of the *rate of exchange* in Brazil, the course of the market since July has given the strongest evidence in support of the arguments we then advanced. Events have proven the correctness of our contention that supply and demand are the only controlling factors, and not the question as to the division of the price in Brazil between the paper currency value and the cost and freight or gold price at the seaports in Brazil. The world will only pay a price for a staple article in keeping with its requirements, and as Brazil has produced coffee season after season, such as from 1882 to 1886, at one-half of the currency figure now prevailing, there is no reason why Brazil cannot continue to do so in the future.

Necessity and experience are the best teachers. Free labour has been shown to be more advantageous to the cotton farmers of the Southern States here than slave labour, and the old Portuguese stock in Brazil is fully as capable and economical in running their plantations as any set of farmers in the world, and just as well able to meet the exigencies of labour as were the Southern farmers after abolition of slavery in the United States.

There is no doubt that the cost of production is constantly changing in all countries. What the real cost of production is, and what will check increase of production of Coffee, nobody has so far been able to determine in a satisfactory way, and as production is still increasing, not decreasing, all talk from Coffee-growing countries everywhere in reference to the hardships of present prices may be dismissed from the minds of Coffee people. It is apparent that the Coffee world at large continues very nervous, and at the slightest improvement, due to any cause, no matter how slight, Speculators are for ever climbing or clamouring for higher values under the misconception that minor causes can materially alter conditions.

We hear to-day from some of the best merchants in the trade in Europe expressions that are in line with our views, and they do not place any reliance in the present improvement, and any permanent rise under existing conditions is not at all probable.

The real cause for low prices, or lower prices is to be found in the fact of *over-production*. On the other hand, speculation for a long time past has been almost entirely in favour of higher prices, and the course of events has shown that no matter how great the aggregation of capital or influence to raise values, it has in the end proved futile to control the market legitimately.

As far as trade conditions in this country are concerned, it is probable that an advance may be made in the price of Roasted Coffee, which simply means an increase in the difference between the value of the Green Coffee and the price of the manufactured article. Such question is simply a regulation of matters entirely apart from legitimate market influences on Green Coffee and should not be considered as forming any part of the argument as to values in the light of present supplies.

W. H. Crossman & Bro.

GENERAL ARTICLES.

INDIAN TEA IN 1900.

Messrs. Stenning, Inskipp & Co.'s Indian & Ceylon Tea Market Review for 1900, dated London, January, 1901, says:—

Course of the Market.—The market opened in January at firm rates for leafy grades up to 7d. to 8d. per lb., pekoe souchongs selling at 6½d. with a strong enquiry, while fine and finest were in small demand; by the end of the month enquiry began to slacken and pekoe souchongs fell to 6d. per lb. During February prices remained fairly steady, and the demand for good and fine improved. The Budget statement was made on the 5th March and sales for that day were suspended in consequence of the heavy clearances in anticipation of an increase in the Duty. When business was resumed an easier tone prevailed for common grades, and withdrawals of such from sale were numerous, but good liquoring kinds were unchanged. During the remainder of the Season, 1899-1900, prices shewed but little alteration. The New Season's teas began to arrive in June: any parcels with flavour went well, but those of ordinary quality sold at easy rates, Sylhet and Cachar pekoe souchongs going at 5¼. and 5d. per lb. By July, all good teas, especially Assams, were bringing full rates, while common grades were steady. During August many of the arrivals were of very unattractive character and some low quotations were made; good qualities, on the other hand, maintained their position. In September large quantities of indifferent liquoring teas were offered and numerous parcels of pekoe souchongs went at 4¾d. per lb. October witnessed a further weakening in the value of common grades, pekoe souchongs selling as low as 4½d. per lb. By November, still lower quotations were marked for common and all poor-liquoring descriptions, owing to the heavy preponderance of such. The market closed in December with a better feeling for all good liquoring teas, but with a weak tone for common.

Quality.—Assam growth, as a whole, have not been up to their usual good standard, and some very moderate, and occasionally very low, prices have resulted; but parcels of sterling character have met good competition and realized satisfactory rates. Cachar and Sylhet: quality from the former district has been poor almost throughout the season and some very low quotations have been touched; from Sylhet also arrivals have in most cases left much to be desired, but a few gardens have fairly maintained their standard, and in these cases good prices have been reached. Dooars and Terai: The produce of these districts, with a few exceptions, has been most disappointing and has led to lower quotations than ever before recorded; the liquors have not only been devoid of flavour, but too thin to encourage their being freely taken by blenders who are usually very large buyers of Dooars growths.

Darjeelings.—Parcels having the full characteristic flavour have met ready buyers and at prices that will have been very encouraging to the producers. The proportion of such teas has unfortunately been small; flavour has been mostly wanting, and thus the market for some time past has been a very slow and unsatisfactory one, tea of poor quality having fallen much in price in common with that from other districts. Kangra Valley sorts have been in limited supply and of similar quality to those of recent years. Travancore is steadily increasing its out-put, but the bulk of the offerings this season has so far been of poorish character. Neilgherry growths are only occasionally offered, and call for no special comment.

The Season's Results to producers will, we fear, prove discouraging when accounts come to be made up; and the extremely low value to which common tea has fallen will be a source of anxiety to those who are compelled to depend mainly on quantity. The cheapness of tea generally is undoubtedly due to the rapid increase in production, especially in Ceylon. India will probably send to the United Kingdom 8,000,000 lbs. more than in the previous season, and Ceylon 11,000,000 lbs. more; and what renders the market out-look somewhat unpromising is the circumstance that in neither country has production yet reached its maximum. Speaking of India, considerable extensions made from two to four years ago will soon be coming into full bearing; in Ceylon also additions to the cultivated area have yet to render their quota, and no effort is being spared by careful cultivation to stimulate the productiveness of gardens To meet this increasing supply great exertions are being made to find new markets, and the annexed figures under this head are encouraging. Producers should endeavour to maintain and widen the taste for British-grown teas by giving due care to the important question of quality. It seems to us that a note of warning under this head is necessary, for the current season's crops from both India and Ceylon have been represented by an unusually large proportion of teas of a poor type, resulting, as already stated, in lower quotations than ever before known. Owing to the very abundant supply in the present day, mere quantity without quality is not likely to pay. The leaf should be plucked carefully and at the proper time, that is before it has become coarse, and every care bestowed on its manufacture, to ensure the best results both in strength and flavour.

Position and prospects.—Notwithstanding that the delivery of Indian tea for the year 1900 shews an increase of 4,223.000 lbs. over that of 1899, the new year commences with an increase in stock of 8,439,000 lbs., which is far too heavy. It is not surprising that stocks should have accumulated, seeing that the total Import from India and Ceylon together during the past twelve months has exceeded that of two years ago by 32,250,000 lbs. The raising of the duty from 4d. to 6d. per lb., morever, has not come to help

matters. It is difficult to gauge what effect this is having; it may possibly tend to depress the value of the lower classes, but is not, we think, telling appreciably on consumption. Altogether the position can hardly be regarded as encouraging, and no real improvement can be looked for until supply and demand are once again more on a level. Production has come along too fast in the last two years, resulting in excessive supplies, and this, together with poor quality, is the explanation of the low prices. In place therefore of aiming so much at large crops, Indian and Ceylon planters would be well advised to pay more regard to the quality of their teas. There can be no doubt that the very large quantity of inferior tea manufactured this season must in great measure be ascribed to coarse plucking in the too eager desire to obtain large out-turns. A continuance of this policy would tend to a further lowering of prices and, indeed, might lead to disaster to many gardens.

Packages.—It is of the utmost importance that the packages used should be such as will thoroughly protect the tea, and ensure its coming to market in perfect condition.

Other markets.—The past year has witnessed still further progress in the quantity of both Indian and Ceylon sent to markets other than those of the United Kingdom: the totals so diverted were

	1900.	1899.	1898.

THE "PIONEER" ON THE TEA CRISIS.

The Indian Tea Association is certainly doing its duty thoroughly in the matter of seeking to raise the industry over whose interests it watches from the slough of despond into which it has fallen. Within the last two months it has issued several important letters and of these, three may be noticed as commanding most attention. On December 5th the Association addressed the Bengal Government on the subject of a small export tax upon tea, the proceeds to be devoted to the work of pushing the sale of the Indian article in foreign markets. The example of Ceylon was quoted, where such a tax has been levied since 1892, the amount collected being about 2½ lakhs. The aid of Government is invoked on the score that although the majority of tea proprietors are in favour of devoting a large sum annually on the lines laid down in Ceylon, unanimity in the matter of subscriptions cannot be secured. As 12 pies go to a anna, which is now equal in value to a penny, a tax of half-a-pie per pound would be something so small that it could not affect profits seriously. Even a tax of a quarter-of-a-pie would yield 2¼ lakhs. Though the principle of the Government undertaking to act as sub

cription-collector, on behalf of a particular industry, from its own members is a novelty, that need not neccessarily be a bar to its adoption if the advantages of the course are clear. The machinery for collecting the tax is at hand in the existing Customs House and no difficulty would be experienced in dealing with the exports of tea from whatever port they might be sent. In Ceylon no charge is made for collection, the money being handed over to a Joint Committee of the Local Chamber of Commerce and the Planters' Association; but the Government retain the right of seeing that the funds are not distributed otherwise than in a manner likely to be beneficial to the industry.

The second letter to which reference may be made was addressed by the Tea Association to the Government of India in the Revenue Department on January 9th. It is an earnest appeal to the supreme authorities in this country to address the Home Government with a view to the cancelling of the recent enhancement of duties upon tea imported into England. The tax is now 7d. per lb., and the request is made that the duty may be reduced to its former level of 4d. . . . . We can sympathise with planters and proprietors of estates, but there is one weak point in the argument of the Association. In their letter it is said: "Production during the past five years has increased by as much as thirty per cent; and this has been mainly due to large extensions of the cultivated area which were planned and undertaken when the rate of exchange with Europe was at a low level and in the expectation that it would so remain." Now, no one in his sober senses could have expected that the Government of India would be content to go on financing the Empire with the rupee only just above one shilling in value and liable to fall indefinitely lower; they were compelled to take action in self-defence and in the interests of the general tax-payer. Had tea planters gone more cautiously to work, they would not have had to complain of over-production and low prices. The third letter of the Association is one addressed to all planters and agents of tea estates, and it contains simple suggestions which, if adopted, may curtail the output, put a better grade leaf upon the market, and thus cause prices to rise again. It remains to be seen whether the opinions of the majority will be in favour of temporarily abandoning 10 per cent. of the area under cultivation, or of having a close season for picking, or of finer plucking. One or all of these suggestions may be adopted, and there is another to use cheap teas for distribution in India so as to encourage their use among the population generally. Looking at the question from a broad economical point of view, we should say that these proposals ought to be adopted *en bloc*.

PRODUCE AND PLANTING.

Cheap Tea, the Duty, and Over-Production.—The "Daily Express" of Monday published the following cable:—"Colombo, Sunday.—With a view to reducing the excessive production of tea, Mr. H. R. Rosling, chairman of the Ceylon Planters' Association, suggests that all Ceylon and Indian tea planters shall leave one-tenth of their tea unplucked for two years." The "Express" has since interviewed the leading lights of the Mazawattee Tea Company, and makes the following comment thereon:—"Cheap tea," said a Mazawattee director to an "Express" representative, "is on all fours with arsenical beer. If Sir Michael Hicks-Beach puts twopence more duty on tea he will poison half the working-classes of the country." Mr John Lane Densham, chairman of the Mazawattee Company, took a serious view of the situation. He had just come from the presence of two tea-planters, who are leaving for Ceylon within a week, and said, with reference to the cable message from Colombo, "That statement goes right to the root of the matter. One of these tea-planters intends adopting this very course. The bad effect the rise in the tea duty has had upon the tea trade is due chiefly to the total disorganisation which has come about through the changes of the canisters that the grocers sell. Excepting with regard to good teas, from 1s. 10d. upwards, the public have been slow to rise to the occasion. For instance, people who had been drinking before the rise in the duty common tea at 1s. 4d. per lb. have continued to drink it at 1s. 4d. and not gone up to 1s. 6d. Those who were drinking 1s. 6d. tea continued to drink 1s. 6d. tea, instead of going up to 1s. 8d. But as this rise in the tea duty falls much more heavily on common tea than it does on good and fine tea, there is every reason to hope the better canisters of the grocers will not suffer. The percentage of the duty of 6d. on 1s. 4d. tea is very heavy, whereas the precentage of 6d. on 2s. tea is not felt so much. In other words, it is not the working man but the payer of income-tax who is bearing the cost of the war As a matter of fact, the rise in the duty has been felt by the tea growers more than any other branch of the trade, prices of common tea in the wholesale market having now dropped to a point that is unremunerative. I can see no hope for tea-growers unless they seriously consider the curtailment of the output of tea; and this can very easily be done if one and all agree, as mentioned in your message from Colombo, to pluck finer and send better tea to this market." Mr. Densham showed four samples of the cheapest tea that is largely consumed in Great Britain. It is the practice of the firm to obtain specimens of all imported teas. Coarser stuff could hardly be imagined passing as tea. The samples suggested a chopped-up crow's nest, leaves and sticks being in about equal proportion. Then he placed alongside these "sweepings of the tea garden" a quantity of the pure leaf, plucked from the topmost young blooms of the bush. Taking some in his palm, he fondled the curly, fragrant leaves with more than business enthusiasm, and said: "That is tea; the sort of tea all respectable growers want human beings to drink. Last January the Mazawattee Company anticipated the Budget by taking out of bond so large a quantity of tea that they earned the distinction of paying into the Treasury duty to the amount of £85,862 8s. 8d.—the largest cheque ever paid for the duty. The original cheque is framed as an office souvenir This year they are hopeful the Chancellor of the Exchequer will leave tea alone, if only to arrest the increased sale of cheap tea, for the sake of the public health."

The Duty Question.—The chairman of the Mazawattee Tea Co., has since written to "Express" to say that on March 10 last year—*i.e.*, five days after the additional impost to the tea duty—his company so clearly foresaw the disartrous effects that the rise in the duty would have upon the tea growing industry, and upon grocers throughout the country, that they sent a letter on the subject to every grocer and tea dealer in the United Kingdom to the number of 160,000, to impress upon grocers the importance of further educating the public into drinking high-class tea as opposed to common tea, the argument, of course, being that as common tea is charged with Customs' duty at the same rate as fine tea, it follows that, apart from the bad effects of common tea, which are too well known, the use of low grade teas is distinctly expensive and wasteful to the British matron Here is a copy of the circular letter to which Mr. Densham refers: "49 and 51, Eastcheap, London, E.C., March 10, 1900. Dear Sir,—In the excitement which has been caused in the tea trade, both wholesale and retail, during the past few days, consequent upon the action of the Chancellor of the Exchequer in increasing the duty on tea by twopence per pound, a certain section of the trade may have lost sight of the intention of the Chancellor of the Exchequer with regard to this extra impost. He, in so many words, expressed his wish that this increase should be borne by the consumer only, and we wish to urgently impress upon you that the only manner in which this wish can be carried out is by every grocer using his influence to induce his customers to drink precisely the same quality tea as heretofore, and to pay the twopence per pound advance. This action on the part of the trade generally would be immensely to the benefit both of the grocer and of the tea-drinking public, as we are sure that no good can accrue to anyone by stimulating the consumption of inferior teas.

We are, Dear Sir,
Yours faithfully,
THE MAZAWATTEE TEA CO., LD.,
(Signed) J. LANE DENSHAM,
Managing Director.

"Ditto" to Mr. Densham.—A correspondent of the *Express*, signing himself "Theine," gives his view of the situation as follows:—"Mr. Densham strikes a keynote that will reverberate throughout the whole of the Tea Land, and will meet with the approbation of all interested in the production of tea. It is somewhat difficult to understand the apathy of the tea producer and his associates, and what is still worse, is the want of unanimity amongst the community. Let the associations that represent the industry combine and use every influence in their power to improve matters. As over-production is responsible for the present slump, let the first step, by all means, be to carry out the excellent suggestion of abandoning temporarily 10 per cent. of their producing area, which would, of course, increase the selling-price and recompense the producer

for the reduced out-turns. We are constantly having our attention drawn to the production of such an inferior class of so-called tea which should be properly styled 'muck.' Could not the aforesaid associations, for the benefit of all concerned, combine their influence to prevent such rubbish being landed on our shores and put into consumption? London seems to be the dumping ground for all teas refused by other ports as unfit for consumption. Why is this? All such so-called teas should be destroyed or denatured. It surely would not be difficult for such a proceeding to receive the sanction of authority. I do not at all anticipate such an injustice will be perpetrated as to enhance the present duty on tea. The present tax of 100 per cent. on the market value is a monstrous shame, as tea is no longer a luxury, but a popular necessary beverage of the people. But no time should be lost in making a representation to the Chancellor of the Exchequer that tea is at present ruinously over-taxed, and at the very earliest opportunity the extra 2d. per lb. should be remitted. It only requires a little combination and business acumen to put the tea industry on its legs again. The short-sighted public should lay to heart Mr. Densham's remark that 'the use of low-grade teas is distinctly expensive and wasteful.'"

Last Week's Tea Sales.—"The public sales of Indian tea were resumed on Wednesday," says the *Produce Markets Review*, "when the moderate quantity of 25,138 packages was offered and prices generally show little change. Common teas continue to form a very considerable portion of the offerings and, excepting those from a few gardens where the quality shows improvement, and for which better prices were obtained, values on the whole were less firm. The quantity sold at 7d. and under has increased, and from present appearances there is not likely to be any diminution in these grades, which will probably remain at the low prices now ruling. The more desirable medium descriptions met with a good demand, and prices were well maintained, and unless a larger proportion of the future supply is forthcoming, it is quite probable a stronger market will prevail later on. The finer teas, in consequence of the comparatively limited quantity brought forward, were well competed for and fetched better prices. The over-production, particularly of the common kinds, has had the effect of establishing the lowest record prices, and satisfactory as the increase in the exports is, it will be necessary to considerably develop this outlet to absorb the surplus stock. The coarser plucking may have been due to climatic causes, but if, on the other hand, those interested in the production were influenced by the higher prices ruling last season to sacrifice quality for quantity, the result will prove the reverse of satisfactory. The market for Ceylon teas opened on Tuesday last, when a fair quantity was brought forward, and met with a quiet demand at about the rates current before the holidays. Common grades, however, barely maintained recent values, and occasionally sold in favour of buyers. In the medium kinds, Broken Pekoes were slightly irregular, while in whole leaf descriptions the tone was much as before."—*H. and C. Mail.*

TEA TRADE PROSPECTS IN THE U. S.

After a period of depression, dating since last August, the tea trade has lately developed symptoms of improvement.

In reviewing the market since the opening of the season, last May and June, it will be recalled that a large business was transacted during June and July. The political complications in China, coupled with advices received from Japan that the crop of that country would show a shortage, induced free buying by the consuming trade. The extent of this buying is shown by the withdrawals from bond during the three Summer months, which in June amounted to 8,790,681 pounds, in July to 14,644,945 pounds, and in August to 9,373,256 pounds, a total of 32,808,882.

As a result of these large withdrawals the distributing trade found itself carrying heavy stocks, and during August a decided slump was experienced in the demand, from which there has yet been no improvement. A more favourable turn to the political outlook in China was also an important factor in checking the demand.

As the fall season advanced the consuming trade gradually worked off its surplus holdings; and, although prices had reacted to a lower basis than those ruling at the close of the Summer, there was little disposition to purchase supplies in advance of immediate requirements. The reason for the continued apathy shown by buyers was found principally in the agitation for the reduction of the war revenue taxes. This, many of the trade believed, would result in the 10 cents per pound duty on tea being repealed. With such a possibility hanging over the market a policy of extreme conservatism was quite generally shown by buyers, who, in withdrawing teas from bond, limited their takings to only such supplies as they needed to meet their most positive requirements. The information received from well informed sources and published in these columns were at no time of a character to indicate that a change in the import duty on tea would be made; and now that it is practically certain that the duty will remain the trade finds itself practically bare of surplus stocks. Importers' holdings, exclusive of Congous, are understood to be only moderate, and the general impression seems to be that after the holiday season is past an improvement in business can be reasonably expected and that a recovery will probably follow from the present low basis of values.

As showing the course of values the past six months the following prices paid at auction on the dates mentioned are of interest. Those paid on June 6 represent the market before the rise started, those of July 25 when top values were reached and those of December 12 and 19 present ruling quotations:

	In Bond.		
	June 6.	July 25.	Dec. 12 & 19
Moyune—	Cents.	Cents.	Cents.
Hyson	7¼a 7½	9½a10	7 a 8½
Young Hyson	8 a22½	13½a...	9½a23½
Imperial	11 a17	11½a17½	9 a17
Pingsuey—			
Imperial	9¼a13	12 a13½	10½a14
Gunpowder	8 a20½	10¾a11	8½a18
Congou	10½a12½	13 a15½	7¾a16½
India and Ceylon	11¾a17	11¼a17	9½a19
Formosa	11½a18½	13 a23½	11¼a20

Importers of tea have experienced a sad lesson the past six months. The active trade demand experienced early in the Summer enabled them to market their holdings of old crop teas at good values. To replace their spot holdings, however, they entered the Eastern markets as heavy buyers; they too being stimulated by the threatening political outlook in China. The result was that the shipments of tea from Chinese ports during July-August were unusually heavy, and when they reached their destination in September, October, and November they found dull, listless markets, with the basis of values ruling generally unsatisfactory for sellers.

The following figures show the supply of the China and Japan teas that has come into sight to December 15 and the probable total supply for the season of 1900-1901, with comparisons:

These statistics indicate that the estimated supply for the season is about 3,500,000 pounds in excess of last year. The amount of tea that has come into sight to December 15, however, exceeds that of last season to the same date by 13,097,585 lbs., the result of the unusually heavy shipments from the East early in the season. Statistically, therefore, the outlook can be considered an encourag-

ng one. It is generally conceded that the supplies in the hands of ne consuming trade are small. According to the last figures of the ea Association the stock of tea in the United States warehouses n October 31, 1900, was 47,183,653 pounds. and the stock of tea in ew York bonded warehouses on November 30, 1900, was 31,507,021 ounds. The supply of tea estimated to come into sight for the emainder of the season is 11,801,235 pounds against 21,305,997 ounds, thus showing that there is no excessive supplies to be aken care of.

As to the individual crops, greens show a slight shortage, which s exclusively in country greens; Pingsueys if anything being somehat larger. Japans are expected to fall short of last year's supply y about 2,500,000 pounds. Formosas show no decided change. oochows are about 500,000 pounds short. The increase, therefore, s wholly in Congous, the supply of which estimated to show an inrease of about 7,100,000 pounds over last season and practically ouble the supplies of the seasons of 1898-99 and 1897-98.—*Journal f Commerce, N. Y.*

COCOA AND CHOCOLATE.

Mr. James M. Bugbee, of Messrs. Walter Baker & Co. Limited), Boston, writes in the *International Confectioner* :—

The extraordinary increase in the consumption of cocoa and hocolate in the United States, Great Britain, and Germany during he last decade is due largely to the constantly increasing demands f the confectionery trade. The use of chocolate by manufacturing onfectioners in this country was begun in a tentative way about orty years ago. It had probably been used, to some, extent in rance before that date. The demand for it grew slowly at first; ut as the knowledge of its highly nutritious and wholesome proerties became known the consumption increased very rapidly, and t is now used more largely in the preparation of confections than ny other article, except sugar. About half of all the crude cocoa rought into this country goes to the manufacturing confectioners n the form of chocolate liquor, plain or sweet, for covering sugar nd sweetmeats in various forms.

The development of the confectionery business has probably been greater during the last ten years than in any preceding decade n its history; and the returns from this year's census are awaited vith much interest. In 1850 the whole number of establishments vas 383; in 1890 the number was 2,921. The value of the products n 1850 was only $3,040,671; in 1890 it had risen to $55,997,101. It vould not be surprising to find that the value in 1900 had reached nearly a hundred millions.

In 1860, about the time chocolate was first called for by manufacturing confectioners, the importations of crude cocoa for home consumption amounted to 1,181,054 pounds. Twenty-five years later 1885) the importations amounted to 8,426,787 pounds—an increase of 614 per cent. The increase of population during that period was ess than 60 per cent.; the consumption of tea increased 153 per cent., and coffee 196 per cent.

The imports of crude cocoa for home consumption during the year ending June 30, 1900, amounted to 38,619,187 pounds—about 13,000,000 pounds more than the average for the preceding ten years.

The importations of crude cocoa into Great Britain, Germany, and France during the last year have fallen below the importations nto this country. During the first eight months of this year the mportations into Great Britain amounted to 26,544,000 pounds; nto Germany, 27,395,200 pounds; into France, 22,288,000 pounds; nd into the United States, 34,199,484 pounds. France has not made ny gain apparently in the last few years. Great Britain and Germany have made large gains, but this country has made still arger. This, taken in connection with other industries in which he older countries are losing their lead, is highly significant.

As a consequence of this rapid increase in the consumption of the various products from crude cocoa, the price has advanced about 33 per cent. within the last four years, and the advance is likely to hold for some time, as new trees cannot be brought into full bearing under eight or ten years.

Harold Hamel Smith, of London, who has an intimate and peculiar knowledge of the cocoa trade, says the consumption is tending to exceed the supply; and he recommends the enterprising young men—American and English—who will probably soon be discharged from military service in the Philippines and South Africa, to go into the cocoa planting business, which he represents to be an ideal investment for men willing to live on their estates and oversee the work themselves. On the plantations in the island of Trinidad, at the end of ten years after the trees had been set out, they yield an average of one and one-half pounds of dried beans, which, with scientific cultivation, can be increased to from two to three pounds. With 300 trees to the acre, the yield would be about four and one-half hundredweight. This would give a handsome profit.

On the plantations in Surinam the average yield of dried beans to a tree is about 5 pounds.

The American Consul at Guayaquil, in a recent report on "Cacao Culture in Ecuador," says the profits of a plantation depend chiefly on the quality of the land, management, and nearness to market. Taking as a fair average, one pound per tree, which is a certain minimum, a hacienda of 100,000 trees will produce 1,000 quintals, worth at the present market price $22,500; the expenses (maximum) would be about $7,000; and the nett results per year would be $15,000 or more—a profit of from 40 to 50 per cent. per annum on the capital invested, which will continue for an indefinite period, cacao trees lasting for several generations.

Commenting on the present condition of the market, as viewed from the London standpoint, Mr. Smith says, in a recent letter, that this year has undoubtedly been a very trying one with makers in more ways than one, as not only has the raw cocoa been high, but sugar, arrowroot, the paper for wrappers, and tinfoil have advanced in price; and the confectioners and retailers of eating-chocolate complain that, being unable to put up the retail price, their profits are much reduced.

EARLY COFFEE IN CEYLON.

The *Times of Ceylon* gives extracts from papers by the late John Capper, being the opening chapters of a contemplated volume of reminiscences of an historical character, concerning the first half of the century, written about 1890. From these we take the following extracts:—

THE GOVERNOR'S PLANTING PERSISTENCE.

Shortly after the Governor had planted coffee on the Peradeniya land and erected buildings upon it, the home authorities raised objections to the proceeding, and the property was disposed of by orders, and eventually converted into a sugar estate. But Sir Edward Barnes, resolving not to abandon his original plan of coffee-growing, purchased in the name of one of his Aides-de-Camp, a long stretch of alluvial land, then under paddy cultivation, bordering the Mahavili Ganga and facing the Botanical Garden. This he had planted with coffee, which, under his personal supervision, was brought into a high state of productiveness, and was known as the Gangaroowa estate The coffee has long since disappeared from it, though a few of the original bushes still remain, and it is now a most successful cacao plantation.

A HEADMAN BROUGHT TO BOOK.

One of the impediments in the way of this pioneer of coffee-planting was the absence of roads: there was only a bullock track or bridle path from Peradeniya to Gampola, a distance of eight miles. This being represented to the Governor, with characteristic promptitude he declared that the first planter who opened an estate in the island was entitled to have a road to the capital made at the public expense. A tender for its construction was called for and eventually taken by the person directly interested in its completion, Mr. Bird. Nor was this the only assistance rendered by Sir Edward Barnes to the new enterprise. Some months after the completion of the road, a few of the principal rice-growers of the locality, jealous of the intrusion of a European into their village, and apprehensive of what might eventually be the result of the innovation, induced the neighbouring goiyas or cultivators, to run their ploughs through the newly-made road, which had the effect of rendering it useless for cart traffic. On his next visit to Kandy, Mr. Bird represented the matter to the Governor, who declared that his grievance should be at once attended to. Sending for the Gampola Korala or Headman in Government charge of the district, Sir Edward Barnes informed him of his intention to visit Mr. Bird's plantation at an early hour on the following morning, intimating at the same time that the Korala should be present on the occasion. The headman, knowing well what had taken place, rushed home in a state of great excitement and alarm, and collecting a force of four or five hundred villagers, kept them at work

by moonlight repairing the damage to the road throughout the entire night, so that on the arrival of the Governor in the village at an early hour on the following morning, he found the road in good order and the entire Gampola population awaiting him.

ILL-PREPARED FOR SPORT.

It has been said, with perfect truth, that in the pioneering days of coffee-planting and road-making Ceylon was a sportsman's paradise, as well it might be, for the vast forest regions of the interior down to the verge of civilisation swarmed with wild beasts who were then masters of the situation. The chief of these were the elephants, who by force of numbers, weight, and audacity might well claim to be monarchs of the forest. The ill-armed natives of Kandyan villages, bad sportsmen at all times and chiefly accustomed to take "pot shots" at the mildest and most diminutive game, were never able to face a charge by an elephant, whose massive form and shrill trumpeting filled the Kandyan with abject terror. Village cultivators were frequently heavy sufferers by the nocturnal maraudings of these wandering beasts in search of garden produce. Yet they rarely attempted any reprisals beyond the firing of a village fowling-piece. Mr. Bird being the possessor of a tolerably good battery for small game had inspired the villagers in his vicinity with a deep respect for his prowess as a sportsman, though since his arrival at Gampola he had never bagged anything larger than hog and deer.

THE EARLY SUCCESS OF COFFEE.

That some of the early selections of locality for coffee-planting were unfortunate, must not be regarded as indicating any want of judgment on the part of investors. So little was then known of the requirements of the plant, or of the conditions requisite for its successful cultivation, that we should rather feel surprised that so many of the early ventures were successful. The vast expanse of virgin forest land extending from Matale on the north to the Ouvah principality on the east, and the lower ranges of Saffragan on the south-west, presented a magnificent field for the operations of British investors, but nothing was known of the capabilities of the various soils.

VIRGIN LANDS.

Save where the Kandyan hunter had tracked the elk or the panther, or where the wild Veddahs had made their miserable homes in rocky caves or hollow trees, the solitude of that vast area, extending to the great wilds of the north, had not been broken by the sound of the human voice since the early ages when invading hordes of Hindu warriors swept over the country, deposing the native sovereign and installing rulers of their own race in the palaces of the now buried cities. The axe of the planter had not yet awoke echoes in the great wilderness of the central province, where before many years the thorny bramble was replaced by the rose, and the trumpet of the elephant yielded to the voice of women and the laughter of little children.

FRENCH DUTIES ON COLONIAL PRODUCE.

A correspondent writes to the *Times*:—

During the last few months the Paris correspondent of the *Times* has made several references to the increased duties which the French Legislature has imposed upon colonial produce, including coffee, chocolate, tea, and spices. These new duties have been sharply criticised by the British Chambers of Commerce, but they have scarcely received in this country the attention which they deserve as an important illustration of the commercial policy of our neighbours. The enhanced taxation, although its enforcement is postponed, is intended to come into effect in a few months, so that the present time is opportune for a recital of the facts. No indictment can be so eloquent as a bare history of these extraordinary imposts.

Until February last a uniform duty was, under a law of 1892, levied in France on colonial products, irrespective of their origin. The duty on coffee was 156f. per 100 kilos, estimated to be equivalent to 121 per cent. of the value of the coffee itself. Brazil, in the course of commercial negotiations, is said to have demanded a reduction of this heavy tax, but France refused to comply; and when Brazil threatened reprisals in the shape of discriminating duties on French goods, France retaliated by increasing the duties on coffee and on colonial produce generally. By a law passed on February 24 last a minimum tariff, fixed at the old rates of duty was applied to colonial produce from countries enjoying most favoured-nation treatment, while a general or maximum tariff at roughly, double the old rates was applied to imports of such produce from countries having no commercial agreement with France. Brazil, be it observed, is almost exclusively concerned with coffee, so that the enhanced duties on the remaining commodities fell mainly on other countries. India, and many British colonies, produce one or more of the products subjected to the new taxes, and as, in the absence of a commercial arrangement, they do not enjoy most-favoured-nation treatment in France, their products are liable to the new maximum tariff.

The story up to this point is sufficiently curious, for we see that nations having no quarrel with France are condemned to fiscal penalties merely as an incident in a contest with Brazil. But the sequel is still more striking. Brazil, by making a courageous stand, forced her adversary to grant concessions. By a law of July 17, 1900, Brazil, secured most-favoured-nation treatment, and her coffee, which was menaced with a duty of 300f. per 100 kilos, was admitted at 136f per 100 kilos, or 20f. less than the old rate. Under a decree of August 29 last many other countries, including British colonies, possessions, and protectorates, received the benefit of this reduced rate until the end of last year, the French Government, if it thinks fit, being empowered to apply the minimum tariff for any period not exceed- ing two years from the promulgation of the law of February 24, 1900. A further extension until June 30, 1901, has been granted by a decree of December 22, 1900, to British colonies, possessions, and protectorates, and to other countries duly enumerated. Whether the French Government will again extend indulgence remains to be seen; but, in any case, it is important to note that the full limit of time allowed by law will be reached on February 24, 1902. After that date the general tariff must come into operation. In about six months, as at present arranged, or in about thirteen months at the utmost, Brazil, which defied France, will be in a position of vantage, as compared with India and other British possessions, which have given no cause of offence at all.

The severity of the new duties and the extent of the enhancement can be best appreciated by reference to the following table:—

Per 100 kilos. (=nearly 2 cwt.)

		General Tariff.	Minimum Tariff.
		Francs.	Francs.
Coffee	Beans	300	136
	Roasted or ground ...	400	156
Chocolate	Over 55 per cent. of cocoa	300	150
	Less than ditto ...	200	102¼
Tea ...	.. ..	400	208

Coffee, therefore, will under the higher tariff be charged duty at a rate equivalent to more than 13d. per lb., or nearly nine times the rate levied by the British Customs authorities.

The hardships which this drastic legislation will entail on British possessions were forcibly depicted in the monthly circular issued by the British Chamber of Commerce in Paris. They were also dwelt upon at the fourth Congress of Chambers of Commerce of the Empire, held in June last, and at the meeting of the Association of Chambers of Commerce of the United Kingdom held in Paris in September. The Congress and the Association passed resolutions urging Her Majesty's Government, in conjunction with the Governments of the colonies and of India, to take immediate steps to obtain most-favoured-nation treatment for our possessions from those countries which have granted most-favoured-nation treatment to the United Kingdom, and against which the colonies are not discriminating in the application of their Customs tariffs. The justice of this demand cannot be questioned.

It is stated, and probably with reason, that the new duties are intended to serve as a lever for securing special concessions from the countries affected. But let us consider how far such a policy can succeed—for example, in British India, which sends to France large quantities of coffee and pepper, besides tea, cinnamon, and other colonial produce. Indian coffee planters have already complained loudly of the new duties. Their industry, in recent years, has suffered severely from disease and from unfavourable seasons,

d it is perpetually endangered by the keen competition of Brazil, ıose vast out-turn of coffee has sent down prices to a low level. ıe exports of Indian coffee to France in the last five years have en as follows :—

1895-96.	1896-97.	1897-98.	1898-99.	1899-1900.
cwt.	cwt.	cwt.	cwt.	cwt.
101,769	71,871	76,856	83,543	98,853

The enhanced French duties, it is asserted, will entirely exclude dian coffee from France, and this crowning disability will severely jure the industry. Indian tea, also, which has been sent to ance in increasing quantities, will probably be driven out; and e same is true of pepper, of which France has taken large supplies. France, indeed, threatens to deal a serious blow at India, which just recovering from the severest famine of the nineteenth century. et goods of French origin have received the same treatment as ose of English origin from the Government of India, and the ench settlements in India have always been treated with the reatest consideration.

But, even if India should desire to make concessions to France, ould it be possible for her to do so? The existing Indian tariff not protective or differential. The Customs duties, being imosed purely for revenue purposes on a liberal basis, are levied unirmly on goods from the United Kingdom and all foreign countries, ith the sole exception that countervailing duties are placed on ounty-fed sugars. France, however, has never sent much sugar to ndia; and the abolition of bounties, which now seems imminent, ill once more put all countries in the same position in Indian ports.

The chief imports from France into India in the four latest fiscal ears have been as follows: Spirits (chiefly brandy), wines, silk anufactures, apparel, clocks and watches, cotton goods.

Now, the tariff on silk manufactures, apparel, and clocks and atches, is only 5 per cent. *ad valorem*, while on cotton goods, hich France sends in rapidly increasing quantities, only 3½ per ent. is charged. On wines and spirits, of course, higher rates of uty are levied; for India, like other countries, imposes on coholic liquors, whether produced at home or imported, tolerably igh duties But rates such as 1s. 4d. per gallon on still wines and s. 4d. per gallon on sparkling wines cannot be considered excesve. French brandy is taxed on the same scale as British whisky. an France expect that India will give her a preference over the nited Kingdom and over various countries with which India has ommercial treaties? And can she expect that a fiscal manœuvre hich places India at a commercial disadvantage will be as fruitful s a policy of justice and reciprocity? France does not say do *ut es;* but rather, I will endeavour to destroy a branch of your trade. nless you give me preferential rights which will prejudice all ther countries, including England herself. Let it also be borne n mind that France can reap no direct gain from the enhanced uties. They are so high that Indian coffee will be excluded; ence no revenue will accrue. French consumers, very heavily axed already, will not pay 7d. a lb. more for Indian than for Brazilan coffee. Brazil, then, will alone profit, for those Frenchmen ho formerly drank Indian coffee will, in future, be compelled to rink inferior Brazilian coffee.

The action of France, in short, is illogical, inequitable, and ngenerous. It is worthy of M. Méline, but not of the present Ministry. In commercial England this policy must engender uspicion and resentment. The growing sense of Imperial unity nakes the centre and each part of the Empire more alive to the njuries which any other part suffers; and the strength and reality f this Imperial sentiment have been decisively proved in the recent lections which have returned Her Majesty's Ministers to power.

In welcoming to Paris the delegates of the Association of Chamers of Commerce of the United Kingdom last Autumn, M. Millerand spoke of the strong ties which bind together England and France; nd he declared that French merchants, manufacturers, and agriculturists are convinced of the necessity of maintaining and strengthening the friendly relations between the two countries. His exclusive policy with regard to British colonial produce is ardly in accord with these fair words. If M. Millerand and his colleagues are genuinely anxious to reciprocate the friendly fee ings which England bears towards France, they cannot do better than adopt the suggestion of the British Chambers of Commerce by definitively granting most-favoured-nation treatment for all commodities to those of our possessions which have no discriminating tariffs. Such a concession would be acceptable to this country as it would be honourable to France.

IMPORTANT IMPROVEMENTS IN TEA LEAF WITHERING.

The results recently obtained in Ceylon from the artificial withering of tea leaf are of so much importance to the whole tea industry that they deserve some special reference in our columns. Messrs. Davidson & Co., Limited, of Belfast, whose "Sirocco" Tea Mechinery for every other process in the manufacture of the leaf is so widely known and highly appreciated, claim the credit of having solved the difficult subject of tea leaf withering. The experiments made by them in this connection extend over a period of fourteen years, during which, and more particularly within the last four years, we believe, that they expended well on to £10,000 in apparatus, plus cost of conducting large scale trials in different factories in India and Ceylon before attaining the present satisfactory results.

These experiments were carried out by Mr. F. G. MaGuire, under Mr. S. C. Davidson's guidance and directions, and the resulting outcome is that now, at a small outlay to the tea garden proprietor, thorough control of the wither is, it is claimed, so perfectly obtainable that the quality of the tea produced is equal to that from leaf withered naturally under the most favourable circumstances of temperature and weather; and the time required for producing the wither is greatly reduced, so that the output capacity of the existing withering space is thereby increased to such an extent that in many instances large extensions to withering houses have been obviated.

A cold wither, it is stated, can now be obtained of such satisfactory quality that if a small quantity of the leaf be pressed between the hands it will stick together, showing that the leaf has attained that desirable soft and clammy condition which is so conducive towards the production of best results during subsequent manufacture.

A large number of factories in Ceylon, ranging from sea level to over 5,000 ft elevation, have, we understand, been equipped with the necessary apparatus during the past season, and in actual practice, perfect withers have been obtained in twelve to fifteen hours, from leaf plucked on wet days during the rainy season, and which on arrival at the factory was saturated with rain water.

The opinions expressed by the proprietors and managers of the tea factories in which the new system (the principal item in which is the special adaptation of the new Sirocco fans in existing withering lofts) refer, we understand, in the highest terms to the results obtained.

Mr. F. G. MaGuire is now in this country, and will, we are informed, shortly visit London in the interest of Messrs. Davidson and Co., so that their numerous clients representative of the important tea industry will be enabled to gather further particulars from him as to this new system of withering. The data and details of numerous trials which have been reported on various estates, where the entire crop of leaf is now being withered on this system, can, we learn, also be inspected.—*H. & C. Mail*

THE MELBOURNE TEA MARKET IN 1900.

AN EXPERT ON THE YEAR'S TRADING.

The *Melbourne Age*, of 3rd January, says :—

As usual, from January to June, 1900, there was put little to note of exceptional interest. Indian and Ceylon teas arrived in rather increased quantities, and good medium teas were obtainable at low prices, benefiting the public at the expense of the importers, as prices were unremunerative. In July, however, the political troubles in China and the armed intervention of the Powers opened up the possibility of the China tea export being interfered with, and accordingly the opening sales of new season's China teas were well attended, and buyers were keen operators.

Time, however, proved that the tea districts are undisturbed by the political position and the export, partly due, no doubt, to the keen demand for early shipments, from China this season is not only larger than last year, but in excess of normal requirements, and in consequence prices at this moment are about the lowest on record. Common Congous are a drug in the market, at inside 4d. per lb., whilst good low medium Panyong is slow sale at 4¾d. to 5d. per lb., whilst good low medium Panyong is slow sale at 4¾d. to 5d. per lb. in bond, fine Panyong not fetching more than 5½d. to 6d.,

these prices being, undoubtedly, well below the cost of production. Ceylon and Indian teas have shared in the good and bad fortune of Chinas. The early arrivals doing well, induced larger supplies, which have arrived to a glutted market, and prices are almost, though not quite, the lowest on record.

The general statistical position has also had a great effect and has helped to bring about the present state of affairs, as will be seen at a glance from the following short summary of the position to-day :—

1. Last year's large Indian crop is being again exceeded, and no less than 182,000,000 lbs. of tea is expected to be produced by the Indian tea gardens this year, or, say, 7,500,000 lbs. more than last year.

2. Last year's large Ceylon crop is being again exceeded, and over 140,000,000 lbs. of tea is expected to be produced by the Ceylon tea gardens this year, say, 10,000,000 lbs. to 15,000,000 lbs. ahead of last year.

3. An increased duty in England, the main market for Indian and Ceylon teas, has disorganised trade there and checked consumption, especially on lower grades.

4. Poor crops and a larger proportion than usual of common and undesirable teas.

5. The difficulty of finding new markets for the yearly increased supplies has caused over-supply in all possible markets.

The result of all these factors is tea is now selling everywhere well bellow the cost of production, and it has become a question of the survival of the fittest, and, no doubt, some of the older and less fertile gardens will be forced out of cultivation, or fresh outlets will have to be found. The latest quotations are, in bond, per lb. :—4½d. for common Indian and Ceylon, 5d. to 6½d. for fair to medium Pekoe Souchongs, 7d. to 8½d. for good liquoring Pekoe Souchongs and Pekoe, up to 1/ for fine to finest.

Stocks in Victoria are excessive, consisting on the 19th December, 1900, of 3,022,751 lbs. China, against last year 1,613,807 lbs.; 657,446 lbs. Ceylon, against last year 433,181 lbs.; 1,450,510 lbs. Indian, against last year 888,446 lbs.; or over 2,000,000 lbs. excess. Such figures fully account for unremunerative prices to importers. Still, the public get the benefit, or should do so, in exceptionally good blends, and, no doubt, sooner or later, supply and demand will be better adjusted.

TEA GRADES IN THE UNITED STATES.

The Board of Managers of the Coffee Exchange have approved the report of the Committee fixing the differences in value between grades of tea in accordance with the rules and regulations previously adopted for listing tea on the Exchange. The differences follow:

Green Tea—
- 1—Pingsuey Gunpowder, plus 3½c.
- 2—Pingsuey Imperial or pea leaf, plus 1c.
- 3—Country Young Hyson, plus 1c.
- 4—Pingsuey Gunpowder, minus ½c.
- 5—Country Young Hyson, minus 3½c.
- 6—Pingsuey Gunpowder, minus 4c.
- 7—Pingsuey Imperial or pea leaf, minus 4c.
- 8—County Hyson, minus 6c.

Black Tea—
- 1—Formosa Oolong, plus 1½c.
- 2—Formosa Oolong, even,
- 3—India or Ceylon, minus 1c.
- 4—Foochow Oolong, minus 1½c.
- 5—Congou, minus 1½c.
- 6—Formosa Oolong, minus 2c.
- 7—Foochow Oolong, minus 3½c.
- 8—India or Ceylon, minus 4½c.
- 9—Congou, minus 5½c.

Japan Tea—
- 1—Pan fired, plus 4c.
- 2—Basket fired, plus 3c.
- 3—Pan fired, plus 2c.
- 4—Pan fired, even.
- 5—Basket fired, even.
- 6—Pan fired, minus 1½c.
- 7—Basket fired, minus 1½c.
- 8—Sun dried, minus 1½c.

The Board also authorized the purchase of trading samples, and it is expected that everything will be in readiness to begin active trading in tea on the Exchange soon after the first of the year.

The classes and grades deliverable on contract are :

Japan Tea—
- 1—Pan fired.
- 2—Basket fired.
- 3—Pan fired.
- 4—Pan fired.
- 5—Basket fired.
- 6—Pan fired.
- 7—Basket fired.
- 8—Sun dried.

Green Tea—
- 1—Pingsuey first Gunpowder.
- 2—Country second Gunpowder.
- 3—Country first Young Hyson.
- 4—Pingsuey off second Gunpowder.
- 5—Pingsuey second Imperial.
- 6—Country Hyson.
- 7—Pingsuey fourth Gunpowder.
- 8—Country fourth Young Hyson.

Black Tea—
- 1—Superior to fair Formosa.
- 2—Foochow Oolong.
- 3—India or Ceylon.
- 4—Congou.
- 5—Good to superior Formosa.
- 6—India or Ceylon.
- 7—Congou.
- 8—Foochow Oolong.
- 9—Fair cargo Formosa.

THE INDIAN TEA INDUSTRY.

Mr. J. B. Leslie Rogers writes to the *Pioneer* :—

It is not *cacoethes scribendi*, but the sense of public duty which all planters owe the tea industry, that once more induces me to take up my pen and enter the lists against those who refuse to wheel into line with the progressive tendencies of the new century. In this direction I feel I have an able coadjutor in your well informed correspondent, "Camellia," whose trenchant article in your issue of the 5th instant, has done much in clearing the way towards sorely needed reforms. That his pen may never dry till victory is achieved is the fervent wish of all who are on the side of continual improvement and practical commonsense. What we sadly want at the present juncture is plain speaking, and plenty of it, but the pity is that there are so few in the planting community who are able to have the courage of their opinions, or must it be reluctantly admitted, have any opinions at all. The reason for this is not far to seek. The industry has hitherto been carried on in a mechanical automatic way by methods based on conditions that prevailed a quarter of a century or more ago. All the conditions have irrevocably changed, but a fossilised brainless system remains as a drag on all attempts at improvements. Managers are chosen not so much for the fitness, but for their subserviency to antiquated rules and customs. To think independently is to lose their appointments, while to slavishly adhere to orders often issued by the ignorant and incompetent, is still a sure road to tolerance and permanency. When men are thus reduced to passive thoughtless automata, can it be wondered that there is no initiative left, and that there are comparatively so few capable of rational and logical opinions on subjects appertaining to their profession. Planters themselves are much to blame for the unenviable position in which they now find themselves. They have allowed their minds to sleep the sleep of inert torpidity, while their industry has steadily drifted into the hands of the self-interested trader, and often the unscrupulous company-promoting exploiter. Now that the awakening has come, and it has been a rude and pitiless one, many will go to the wall, without a thought from those they too faithfully served in their days of blindness,—while those who happen to be left for the time being, can only hope to avert prospective destruction by prompt and unselfish combinations, and a vigorous assertion of their independence in thought and action as trained professional men. In this matter of combination, it is

satisfactory to find that a suggestion I made in a former article, has been energetically acted on by the planters of the Luskerpore Valley in Assam, where a society has just been formed for the interchange of professional opinions on scientific subjects bearing on the advancement of the tea industry generally. It is the first organised attempt towards that unity of purpose which alone can bring about salvation to the community, and all honour is due to the men of Luskerpore for forming the pioneer society in this laudable direction. It is to be hoped other tea districts will now follow the praiseworthy example here set before them. The more unity, enlightenment and breadth of view there is, the better will be the prospects of a successful issue to the present deplorable state of affairs.

With reference to a previous proposal of mine regarding the exploitation of the local native market, it is a matter for congratulation to see that the Indian Tea Association has at last moved in this direction, and that arrangements have been made with a Calcutta firm for the distribution of cheap teas through the indigenous *buniah*. But with all due deference to those who have come forward in this public manner, I cannot help thinking that the Association has laid down for its guidance a rather defective line of policy, firstly, by limiting the period of experiment to only one year, or rather, one winter,—as it is only during the cold weather months any appreciable sales can be hoped for; and, secondly, in confining the sphere of their operations merely to Bengal. To give the scheme a fair trial, it must be energetically carried on for two or three seasons at least. Time must be allowed for the acquisition of a new taste, and familiarity with a new commodity, before the demand can be expected to become a natural and lasting one. One year's trial cannot possibly ensure this. Further, I cannot help feeling it is an error not to have also invited the active co-operation of the planters themselves in such a scheme, more especially those in the north-west of India, who have already some little experience in this trade. Again, Bengal is not the most feasible place in which to start such experiments, as in that province there are practically no tea-drinkers at present. A taste will have to be cultivated first, and this is a comparatively slow process, and time is what we have most to contend against at this juncture. The above are regrettable oversights, which should be remedied at the earliest opportunity. In the opinion of those who have studied the subject, the places where such an experiment should first be initiated, are the North-West Provinces, Rajputana, Kashmir, the Punjab, British Baluchistan, and along the North-West Frontier; all of which have already a fairly large tea drinking population, who would gladly welcome the introduction of cheap teas among them. This leads to another thought. Here are natural markets in what might be called the very vicinity of the plantations of Kangra, Dehra Dun, and Kumaon, and yet no combined or sustained efforts have been made to absorb them by these favourably situated tea districts, while far away and go-ahead Ceylon is now actually arranging to flood Baluchistan and the Lower Punjab with its production, and thus capture these local markets from under our very noses. Verily, it is a case of *quem deus vult perdere prius dementat*, with us Indian planters. When we are mad enough to neglect such golden opportunities of salvation at our very doors, we richly deserve to suffer and be destroyed. All this comes about from absence of combination, ignorant and inept direction, and what last your correspondent aptly designates as "cheap and empty-headed management."

The causes that have led up to the present crisis in tea, can be mainly traced to three prominent factors. These are in the order mentioned,—the culpable apathy and negligence of shareholders and proprietors to their own interests, the intolerable demands of transit companies, agents, and dock and warehouse men—and lastly, antiquated and incompetent management. Under these three baneful influences no industry in the world could possibly flourish in these changing and progressive times. The whole remedy lies entirely in the hands of the shareholders and proprietors. They have only to rouse themselves to the exigencies of the situation, and insist on rational reforms, and the regeneration of the industry must naturally follow. Let them combine and demand reasonable reductions of the charges now made on their dividends. Let them weed out unqualified and out-of-date managers and directors. And when really sound and competent men have been secured for their highly responsible duties, tell them what is wanted in unmistakable terms, and let them have a free hand to use their acumen, and professional knowledge and experience. I have often been asked to explain the advantages of plantation management through distant agents. I will not answer this question as the little boy did, when asked what the advantage was of getting one's time from Madras? He promptly replied that there was no advantage in getting *anything* from Madras. A reply couched in the same spirit would betoken prejudice, and be unfair to agents generally who, as a body, have undoubtedly done yeomen's service to the tea industry in its early struggling days; and to a certain extent, agencies are and always will be useful factors. But a growing complaint against such bodies is that their methods of management have become hidebound and unpractical, and are at the same time not in touch with the advancing spirit of the age; and further, that they have usurped a great deal too much power and authority that should rightly be exercised only by owners, shareholders and managers, and this excessive power, it is also argued, has been often grossly abused to the detriment of the industry generally. Both systems—that is, management through agents and management by Boards and managers are desirable according to circumstances. But the mistake that has hitherto to be made, lies in the fact, that there has been far too much of the former method, and a great deal too little of the latter, hence the present universal lamentations on the fall of tea. Given an able manager and a well-chosen Board of Directors, and there is really no valid reason why so many valuable tea estates should be run exclusively by Calcutta or London agents. On the contrary, it could easily be shown that there are many tangible advantages in the direct system of control by shareholders through a Board *plus* manager. The wonder is the idea has not caught on more extensively before this. The procedure is no new one, as many gardens can be pointed out which worked on this latter system with the very best results to all concerned. But before any such change can be adopted in the present agent-appropriated estates, it would be well for shareholders and proprietors to realise that it is necessary that they should unreservedly make up their minds to take a more personal and sustained interest in their properties, and above all, that they must have none but the best men as their managers. If these two essential conditions are not to be fulfilled, it would be wiser to sell out at once and let the much-muddled industry drift to its inevitable conclusions, ruin and effacement in the near future. The whole tea industry is now-a-days in a condition of unstable equilibrium, tending, as I said before, towards self-destruction; and whether it survives and flourishes or becomes moribund and ruined, depends entirely on the course adopted at the present time by those who have any stake in it. Any patchwork stop-gap arrangements will not only be futile, but absolutely fatal. The changes that are necessary must be drastic, and of the root-and-branch order. The old régime, after a trial of many decades, has proved to be hopelessly defective and behind the times; and, therefore, to effect a regeneration, new blood must be introduced, and newer and more up-to-date methods inaugurated. The necessities of the movement require that the first step in this direction should be a demand on the part of all shareholders and owners for a thorough and searching inspection and report on their properties by independent exports. It goes without saying that it would be a useless waste of time to expect a wholly unbiased and unprejudiced report of this comprehensive kind from any one cradled and nurtured in the old existing system: vested interests, and age-encrusted ideas and customs would all militate against the report of any such individual being of much practical value. But there are a fair number of competent men of independent and progressive views in India, who might easily be engaged for this purpose, whose opinions and suggestions would be of the greatest utility in enlightening the interested as to what changes are needed. The new season will be commencing shortly, and therefore no time should be lost in calling for these reports. Any suggestions they embodied regarding the executive management, could be adopted immediately, while outside questions, affecting agencies, transit companies, dock and warehouse imposts, customs duties, etc., could be dealt with more leisurely at the hands of a strong representative Tea Association, composed of a combination of all classes intimately connected with tea. This Association, it is strongly urged, should be formed not merely of Calcutta agents, but also of proprietors, shareholders and representatives, professional planters; and there should be a selected paid secretary to publish and carry out the views of the said Association.

Thorough enlightenment of shareholders and proprietors, by means of exhaustive and unvarnished reports from independent experts, together with the formation on the lines suggested of a represen-

tative Tea Association in Calcutta, with affiliated branches in every tea district in India, are, I maintain, the soundest and perhaps now the only means of resuscitating tea and placing it on a safe commercial and progressive basis for the future. Failing a general reform movement, I cannot see any other destiny, but the rapid deterioration of this popular and economic industry in this country, and the transfer of the bulk of our tea trade in our more energetic rivals of Ceylon, and perhaps also to much-abused China, a region which will undoubtedly attract a good deal of European capital and enterprise in the very near future. It is an industrial axiom that trade, once transferred, seldom or never returns to the country of its inception; and this serious consequence should ever be borne in mind when dealing with the present dangerous crisis in tea.

DISTRICT ASSOCIATIONS.

INDIAN TEA ASSOCIATION (LONDON).

The following is an abstract of the proceedings of a meeting of the committee held on 1st January, 1901, when the following members were present:—Mr. D. Cruickshank (in the chair) and Messrs. A. Bryans, J. S. Hulbert, C. C. McLeod, J. N. Stuart, A. G. Stanton, and C. W. Wallace.

1. The minutes of the last meeting, held on 27th November, were read and confirmed. Correspondence with Calcutta, copies of which had been circulated, was laid on the table.

2. It was noted that the subscriptions to the Indian Tea Fund to 13th December amounted to Rs. 78,000.

3. The question of restricting the production of undesirable common tea was discussed, and it was proposed by Mr. Wallace and seconded by Mr. Stuart, that Messrs. Bryans, McLeod and Hulbert be appointed a sub-committee to consider the question of the adoption of a fine system of plucking, with a view to obtaining next season a smaller crop of tea of better quality and the steps to be taken for this purpose, and also to communicate with the Ceylon Association on the subject.

4. *Tea Samples by Post.*—It was resolved that a letter be addressed to the Postmaster-General to suggest that when a new convention is being entered into a change should be made so as to allow of hermetically-sealed samples of tea being sent through the post, and that, in the meantime, the other parties to the convention might be approached by him with a view to obtaining their consent, if possible, to the desired concession being granted at once.

5. *Ullaged Packages.*—A letter from Her Majesty's Customs having been read, it was resolved that further application should be made, asking that the filling up of slack-packed packages may be permitted in the case of London bulked teas.

6. *Tea and "Gunny Bags."*—A letter from Messrs. George Williamson & Co. on this subject was read, and it was resolved that a representation should be made to the Conference Liners on the subject of the damage done by placing gunny bags and tea in the same hold, and urging the discontinuance of the practice on account of the injury done to the tea thereby. Application in the first instance was to be made to the Brokers' Association for a letter expressing their opinion as to the damage done to teas by being placed in the neighbourhood of gunny bags.

7. *Sale of Tea in India.*—Consideration of this question was deferred for the present to admit of correspondence received by late mail being circulated.

8. *Green Tea.*—It was resolved to ask Calcutta what is being done in this matter, and to suggest that arrangements should be made in good time so as to obtain a full supply of green tea next season.

9. *Enhanced Duty on Tea.*—It was resolved that Messrs. J. S. Hulbert and J. Alston be appointed a sub-committee to formulate and carry out a scheme for agitating the question of a reduction of the duty on tea and that a sum of money be placed at their disposal to meet expenses.

10. *Proposed Imperial Fiscal Federation for the Protection of British Interests.*—A letter from the United Planters' Association of Southern India having been read, it was resolved to circulate the same for consideration.—Ernest Tye, *Secretary*.

WHO SAMUEL BYRNES IS.

The writer is glad to take the hand of Mr. Samuel Byrnes and give it a hearty squeeze. That we are parted for the moment by ten thousand miles of seawater doesn't count. May you live right along and prosper, Mr. Byrnes.

In this grumbling old world, more full of aches and pains than an American water-melon is of black seeds, it is jolly to hear a man sing out, "*I am first-class every way; and as for my health it couldn't be better.*"

This is great, especially when we understand what went before. For several years Mr. Byrnes was in bad form. Dyspepsia it was, and a very nasty variety of that abominable complaint. He got but little sleep—so he writes—and was in pain most of the time. He called in the doctors, one after another, and asked them what he was to do.

They agreed on the main point, and they were right. Indigestion, liver disorder, and the nerve troubles which are thrown in as make weights—the doctors said these things once got rid of, our friend would be all right.

And they did their best to bring it to pass—these worthy men. They gave him drugs—the same, no doubt, that have been so often and so vainly given.

"After the doctors gave me up," says Mr. Byrnes, "I tried everything I could think of, or others recommended to me. At first I felt sure I would come upon something helpful, but I never did, until somebody told me about Mother Seigel's Syrup. Even after reading what was printed in books and papers, as to the merits of this preparation, I still shook my head.

"'Not likely to be any better than the rest,' I said; 'the chances are all against it.' For, you see, my heart was, as you may say, down in my shoes, and I was not in a mood to take hope from any testimony that could be produced.

"All the same, I began taking the Syrup; I don't know why. The good effect was almost immediate. I stopped wasting up my food, and commenced to feel stronger and better. Without troubling you with the story of how I got on step by step, I will merely say that the medicine seemed to build me up, and put me together bit by bit, until I was sound and well as any man wants to be.

"I have lived here sixty-one years, and many people in this neighbourhood know what I have said to be true, and were as much astonished at my recovery as I was myself. I am now seventy-one years of age, and hale and hearty. For this wonderful blessing I thank God and Mother Seigel's Syrup.

"As the reader looks at my signature and says, 'What is Samuel Byrnes?' I present him my compliments, and reply that if we ever meet I shall be glad to tell him, by word of mouth, much more than I have written, and to-day all day long for the remedy that made me the man I am." Samuel Byrnes, Lemon Grove, Penrith, N.S.W., September 1st, 1899.

MARKET REPORT.

COFFEE.

Messrs. H. J. Howe & Co's Weekly Coffee Report, dated London, E. C., 12th January, 1901, says:—

Public sales were resumed last Tuesday; at present, however, the market shows no signs of improvement, the demand being very dull.

[illegible] bags new crop East India were catalogued, but met little or no competition, only a few lots selling at less than valuations.

New crop, Costa Rica, attracted little attention and low prices only were realised, while other kinds had to be bought in.

Futures advanced 1/6 during the first part of the week on smaller receipts, but the market has eased off again, and closes at about last week's rates.

EAST INDIA SOLD IN PUBLIC SALE SINCE 4TH JANUARY, 1901.

January.	Mark.	District.	Sold.	Sold.	Sold.	Sold.	P.

TEA.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon and Java Tea Report, dated January 11th, 1901, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
00-1901	983,167	767,763	32,630
99-1900	1,057,627	734,939	34,382

,662 *pkgs.* INDIAN
,201 „ CEYLON
,102 „ JAVA
} Total 81,971 packages were offered in public auction this week.

Although it is difficult to say whether duty payments in 1900 tually represent home consumption, it is satisfactory that figures ow an increase of some 7 million pounds over those of last year, dia contributing about 4 millions and Ceylon 7 millions, while e quantity of China Tea upon which duty was paid fell 3½ million ounds.

The most satisfactory feature is the large increase in the re-port of British grown Tea, lbs. 24,047,679 being sent abroad gainst lbs. 19,868,295 in 1899.

According to the duty payments, the home consumption per head population was 6·10 lbs. in 1900, against 5 98 lbs. in 1899 and 85 lbs. in 1898.

The supply from India and Ceylon is greatly in excess of the resent demand, and prices have in consequence fallen to such an nprecedentedly low figure that many estates must be doing very adly. It would be much to the advantage of the industry if roprietors would come to some understanding, in order to remedy condition of affairs which is rapidly becoming extremely serious, nd can only be effectually alleviated by reducing the output of ne whole crop.

INDIAN.—Useful liquoring kinds continue to attract the chief ttention and sell at steady rates; common descriptions of both hole and broken leaf have again fallen in value, there being a rther drop this week of about ¼d. per lb.

Week's average of Tea sold on Garden Account 1901, 45,621 pkgs., v. 7·00d. 1900, 46,340 pkgs., av. 8·34d.

Total Tea sold on Garden Account 1st June 1900 to date, 803,391 pkgs., av. 7·55d. 1900, 808,198 pkgs., av. 8·46d.

CEYLON.—The market again fell away for low grade Teas, both whole leaf and broken kinds registering a further drop amounting to ¼d., and in some instances even ½d per lb. On the other hand medium and good Teas continue to sell steadily with good competition.

Average for week 6·56d., against 7·96d in 1900.

Ceylon Tea sold on Garden Account 1st January to date, 43,852 pkgs., av. 6·77d. 1900, 47,752 pkgs., av. 7·86d.

JAVA.—The conditions referred to above were reflected in the Java market, and as a consequence several Teas with poor liquor were withdrawn from sale.

CINCHONA.

The N.V. Ned. Veem cinchona-bark department at Amsterdam report the shipment from Java to Europe during December, 1900, at 1,100,000 Amst. lbs., against 626,000 in 1899, 1,018,000 in 1898, 731,000 in 1897, and 890,000 in 1896. The total shipments from January to December have been (Amst. lbs.):—

1900	...	10,780,000	1896	...	10,079,000
1899	...	11,409,800	1895	...	8,827,700
1898	...	11,150,000	1894	...	8,917,700
1897	...	8,437,000	1893	...	7,342,000

The shipments from December 4, 1900, to January 7, 1901, amounted to 1,279,000 Amst. lbs.; and the total from January 1, 1900, to January 7, 1901, was 10,827,408 Amst. lbs. The exports from Ceylon from January 1 to December 17 have been:—

	1900.	1899.	1898.	1897.
Lbs. ...	499,039	592,492	872,836	64,600

QUININE.

The feature of this market is that "shilling quinine" is again an actual fact, that figure having been paid for one or two small parcels held by weak holders in second hands. Prices this week, however, have been more or less nominal, and operators are awaiting the result of the bark-sales at Amsterdam to-day. For March delivery 1s 0⅜d has been paid.

(AVERAGE FOR ALL INDIA 7·00d., JANUARY 11TH).

Please post your next reports to reach Madras on Friday, the 15th instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

Coorg.

POLLI BETTA, 30*th January*.—*Weather*—Has been keeping fine and chill accompanied afternoons by high East wind. *Crops*—have turned out much above estimates and are about the handsomest that have been got for the past 6 years. Stripping is now going on nearly everywhere and pruning is following it up, but it will be some time in March before work is completed. *Labour*—is sufficient ; but general health remains unsatisfactory.

Coorg.

POLLI BETTA, 5*th Feb.*, 1901.—*Weather*—Bright, clear and cold till this morning when it was cloudy. East wind very strong. *Crop*—Stripping going on, followed up by pruning. Crops have turned out much above expectations. *Health*—fair.

Munzerabad.

February 5*th*, 1901.—*Crop*—Most of the estates have the end of a very satisfactory crop in view now. *Weather*—heavy east winds. *Health*—good. *Labour*—abundant. *Interesting*—the Census enumerators are now very busy numbering all the houses ; a notice was sent round asking to have all the dogs tied up, the average Brahman enumerator being of a nervous disposition.

COFFEE IN QUEENSLAND.

IN our "Coffee in Distant Lands" section we give lengthy extracts from the report of the Instructor in Coffee Culture to the Government of Queensland on Coffee Culture in that Colony. Indian coffee planters may, we think, regard with equanimity any progress that Queensland may make in the cultivation of coffee. We are certainly of opinion that, properly pushed, Indian coffees might have found a better market in Australasia than they have yet done. The chief aim of the Queenslander's however, is to grow coffee for consumption in their own Colony, and there are no present indications that they are likely to supply more, at most, than their own and other Australasian markets. According to Mr. NEWPORT, there is in Queensland a zone of country, having a somewhat heavy rainfall, eminently suitable for the cultivation of coffee. It possesses, however, a climate that will necessitate artificial methods of drying by means of kilns or drying machinery, except in a few places. The gardens are mostly small, and as labour is dear this facilitates proper supervision and care. "The oldest inhabitant" in the way of coffee-plants still thrives, but Mr. NEWPORT'S remark on this point have a quiet humour that invites us to quote them verbatim. "The first coffee tree ever imported has been pointed out to me, and it is healthy and flourishing, but, as this has occurred in several different localities, its exact age is somewhat vague." The chief varieties to be found in Queensland are *Arabica* and *Liberica*, and Mr. NEWPORT'S remarks about the former will be read with special interest. They show that in Queensland as well as in India a diversity of seeds has been tried, also that Hybridisation is not being neglected.

Like Indian coffee-planters in earlier day growers in Queensland appear to be working their way onwards from almost complete ignorance of the requirements of the plant towards what may be termed a scientific system of cultivation. Mr. NEWPORT comments on the generally unsatisfactory condition of the gardens, but some of his remarks are less precise than we could have wished them to be. For instance, of some gardens he says that they show promise of a 5 to 6 cwt. crop for trees not more than two-and-a-half years old, but he omits to state how many trees are planted to the acre. Again, while local readers may fully comprehend his remarks as to the area specially adapted to coffee culture, the reader in

India can form no idea of the acreage probably referred to. As matters stand, there appear to be some 200 growers aggregating 700 acres or more. Some 100 acres more appear to have been allowed to lapse during the last year. The largest holding appears to be about 80 acres, the smallest must be small indeed. There is very little coffee in cultivation of more than five or six years of age; the majority is either in its second year or bearing its maiden crop. There is an inclination manifested to open further, and the reduction alluded to is likely soon to be made up. According to Mr. NEWPORT, the area under coffee in the colony at present is capable of yielding easily, with ordinary cultivation and no manuring, on a average of 10 cwt. to the acre, "a crop worth some £20,000 and possibly giving a crop worth at the same valuation £25,000 to £30,000 annually." In quality, the coffee is thought to be improving. Practically all of it is bought up and manufactured in the colony, prices remaining fairly steady at from £56 in the parchment to £112 per ton, clean, according to sample. Certainly, encouraging prices.

As to the future Mr. NEWPORT appears to be sanguine. He notes improvement in quality, alludes to sales at from 1s. 6d. to 1s. 9d. per lb. in tins, but he deprecates too much decentralisation in regard to manufacture, fearing that the placing on the market of a large number of brands would depreciate prices. In support of his assertion that prospects are good, he states that high-grade quality is obtainable and that, in spite of labour competition in other countries the colony's natural advantages can compete with them. He even states that from the grower's point of view, coffee has become the most paying of products, giving a return of 10 cwt., and possibly a 15 to 20 cwt. crop, which even at 6d. per lb. in the parchment would mean £28 gross, or a net return of £15—20 at least per acre. It should be especially noted, however, that at present coffee in Queensland is mostly regarded as a bye-product. It may be that it will yet "pay" as a staple. Mr. NEWPORT thinks it will. At any rate, his figures will make some of our readers regret that the large acreage in India out of which they can make little or no profit cannot be at once exchanged for even a smaller acreage under coffee in Queensland, where, unless Mr. NEWPORT errs greatly, land is to be had that will prove responsive to care and knowledge, and yield coffee enough and of a sufficient quality to make good profits a certainty. We shall await with interest his future reports, commenting on the development of the Coffee industry in Queensland. It is good to know that there is at least one country where profits are derivable from the cultivation of high-grade coffee.

THE TEA CRISIS.

In the course of a letter to the *Ceylon Observer*, Mr. R. V. Webster makes certain remarks that should be pondered by planters of tea. He says:—"Protect 'Ceylon Tea,' the two words that have been established at very considerable cost in some three-fourths of the countries of the world, and estate proprietors need have no fear from 'over-production.'" In the past twelve years Mr. Webster has not only circled the globe twelve times, but have, with the exception of China, Japan, and South America, visited the principal cities in every country in the world, during which time "Ceylon Tea" has been his first thought, and having discussed with the principal importers the merits of Ceylon, India, China, Japan, Formosa, Java, and Natal teas, and the future pro pects of the estates in California, and the Caucasus, he fee justified in coming forward with a scheme that he is confide will remove all fear from 'over-production.' The propose scheme is as follows:—

First.—The Ceylon Government should issue a guarantee stam All exporters of tea from Ceylon should have the option of affixi the said stamp to packet teas above certain standards. It migl be found advisable to extend this privilege to packers of Ceylo tea in countries other than Ceylon, but then the said stamp shou be under Government control, and affixed only to teas packed Bond, and that had passed the standard established by the Ceylo Government.

Secondly.—Standards should be established for bulk as well packet teas, both for leaf-teas and tea-dust. No teas below the standards should be allowed to leave the island bearing the nam "Ceylon," either on the packets or on the cases

Thirdly.—The Planters' Association should advise Governmer what woods are suitable for tea chests; no tea should leave th island bearing the name "Ceylon" except packed in cases made these woods.

Fourthly.—Firms should receive assistance in advertising Pur Ceylon Tea, but not blends. In some countries it may be necessar for the Committee of Thirty to contribute a third; but that shoul only be for a time, later it should be reduced to a fourth, then fifth, and so on, from time to time, as firms come forward prepare to work on a smaller percentage from the Committee of Thirty.

In explanatory remarks Mr. Webster states that his reaso for bringing forward the suggestion of Guarantee stamps more apparent each day as he visits cities in different parts the world, and sees packets labelled "Ceylon Tea," "Pur Ceylon Tea," "Ceylon Tea packed on the Estate," etc., th contents of which are often a blend of Ceylon and Indian Ceylon, Indian and China; Ceylon and China; and Ceylo and Java. Without a Government stamp there would be n use in establishing standards, as unscrupulous firms would con tinue to purchase cheap teas from China, Java, India an Formosa, and blend them with their Ceylons so as to brin down the cost. Ceylon would then foster a demand fo cheap teas which its neighbours can produce in unlimite quantities so long as there is a ready market. He furthe explains that there are many estates in Ceylon that mak their chests from certain native woods that are full of germ that eat through the packages often before they reach th importer. And as to advertising Mr. Webster's remarks:— "If I am not much mistaken our Commissioner in Americ continues to subsidise his chosen few with a third of th amount they spend, while there are many firms who woul be glad to come forward and advertise 'Pure Ceylon Tea were they to receive some assistance, a fifth, sixth, or eve tenth; but so long as they have to stand aside and see thei competitors receiving a third of their advertising refunded it is hardly to be expected they will take up the advertisin of Ceylon tea. In February, 1900, a certain firm applied t the Commissioner in America to know what assistance h would give towards advertising Pure Ceylon Tea in th States? Too late; all funds appropriated,—the result bein the said firm cancelled all advertising contracts in the State of America for Pure Ceylon Tea." Mr. Webster remarks, i conclusion, that were the Committee of Thirty to give a allowance in tea to the importers of Ceylon tea (percentag to be worked out from funds at disposal and approximat amount of Ceylon tea imported into the States of America the allowance to be supplied by the firms from whom the te was imported, it would be an inducement for firms to plac orders for Ceylon tea.

BOARD OF TRADE RETURNS.

DECEMBER, 1900.

The figures for 1900 are now complete and the following show Imports, Consumption and Exports of certain commodities during the twelve months ending 31st December in the last and two previous years.

Coffee.—The reduction in Imports accompanied by an increase in Home Consumption is encouraging, but coffee crops have been heavy and stocks have become heavier in the United Kingdom as well as in other markets.

—		1898.	1899.	1900.
Import	cwts.	922,252	974,991	764.823
Home Consumption	,,	250,818	268,371	283,880
Export	,,	558,910	686,632	462,728
Stock	,,	307,000	318,000	329,000

Cocoa (Raw).—Larger figures all round except in respect to export :

—		1898.	1899.	1900.
Imported ...	lbs.	43,833,993	43,473,241	53,153,228
Home Consumption	,,	32,087,084	34,013,812	37,829,326
Export	,,	9,666,345	11,075,685	9,199,104
Stock	,,	16,514,000	13,343,000	17,546,000

Cocoa (Prepared).—An increase in every branch as compared with 1899. Stocks continue light.

—		1898.	1899.	1900.
Imported ...	lbs.	8,127,191	5,262,394	7,868,592
Home Consumption	,,	6,492,634	5,525,749	6,890,684
Export	,,	721,083	731,525	923,895
Stock	,,	1,249,000	268,000	328,000

Tea.—The growth of Imports has been rapid, and though Home Consumption and Exports have both improved stocks get larger and larger. An advance of 9,000,000 lbs. upon the stocks held at the end of 1899 gives some way to explain present depression in prices.

—		1898	1899.	1900.
Import	lbs.	271,593,683	288,922,251	303,867,140
Home Consumption	,,	235,414,104	242,560,813	249,792,086
Export	,,	36,334,902	32,234,205	43,157,197
Stock	,,	99,476,000	113,086,000	122,613,000

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nicholson's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf people, unable to procure the Ear Drums, may have them free.

Address—No. 989 D, THE NICHOLSON INSTITUTE,
Longcott, Gunnersbury,
London.

U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

The Paris Exhibition.

The Indian Tea Association (London) has issued the following report, dated London, December 29th, 1900, on the work done at the Paris Exhibition, 1900 :—

I am directed by the Committee to hand you a copy of Mr. Langdale's Report on the work done in Paris since the opening of the Exhibition.

It was mentioned in the Report of the General Committee for the year 1899-1900, presented at the Annual Meeting held on the 26th July last, that advantage had been taken of the Exhibition to call the attention of visitors to the merits of Indian Tea and to promote its sale throughout France. With these objects a Tea Room was opened in the Indian Imperial Court, where Tea was sold in cup throughout the whole period of the Exhibition. The service gave great satisfaction to the numerous visitors who daily resorted to the Court in the afternoon, and the superior quality of the Tea supplied was frequently commented on. Numerous small samples of Tea, put up in neat lacquered tin boxes, with copies of a booklet in three languages, descriptive of Indian Tea and containing directions for making it, were given away gratis to people from all countries visiting the Exhibition, and were greatly appreciated. Tea in packets was also sold in the Tea Room and at a stall adjoining in the Imperial Court, and considerable quantities were disposed of in this way. In order further to attract the attention of visitors a display was made of samples illustrating the many different varieties and growths of Indian Tea which are still so little known to the greater portion of the inhabitants of Europe. An excellent collection of well-made Teas, chiefly of the higher grades of Pekoe and Broken Pekoe classes, from well-known Estates in the districts of Assam, Cachar, and Sylhet, the Dooars, Kangra, and Travancore, were got together, the latter by the help of our friends in Southern India. Photographs illustrating the different processes of manufacture and affording views of the districts in which Tea is cultivated, notably of Darjeeling, with the snowy range of the Himalayas, were supplied and attracted much attention. Handsome show cases were provided to allow of the easy inspection of the samples, which were placed in large glass globes so as to be readily seen.

The arrangements at the Exhibition were intrusted to Mr. Edward F. Langdale, who was assisted by Mr. J. Kerrett Rogers, a gentleman who has been long a resident in Paris, and connected with the Tea trade in that city. In the Tea Room a well-dressed staff of girls, who could speak French, attended on visitors, and to give a more marked Oriental character to the Court an Afghan, named Gholab Shah, was employed to distribute samples of Tea.

Several important receptions were given during the Exhibition at the Indian Court, among which may be mentioned that of the English and Foreign Grocers and that of the Associated Chambers of Commerce, when Indian Tea was served to the visitors, and also on the occasion of the visit of the President of the Republic, to which Mr. Langdale refers in his Report.

The arrangements made in 1899 by your Committee contemplated a somewhat larger space than was actually allotted by the Royal Commissioners, and the want of additional room

for visitors was at times felt to be a drawback. Your Committee, however, are satisfied that the work done has been productive of good, and, with the view of maintaining the ground that has been gained, arrangements have been made for carrying on the work at No. 48, Rue Faubourg St. Honoré, where Tea will continue to be sold in the cup and in packets. The depôt at No. 3, Rue d'Alger, which has been used as a centre for the sale and distribution of Indian tea throughout France, will also be maintained, the work at both places being under the joint supervision of Messrs. Langdale and Rogers.

Mr. Langdale estimates that there is room for 80 guests at a time in the new premises at No. 48, Rue Faubourg St. Honoré.

The charge made for Tea in packets was and will continue to be 3f. 50c. per French pound, a price which the French themselves consider to be remarkably cheap, including as it does the heavy duty levied in France.

The following Press notice gives as fair an account as could be wished of the work done in Paris :—

"Nothing of this kind has ever been done before in Paris, or has succeeded so well. The attempt to sell Tea to the public at previous Exhibitions has usually ended in disappointment. The object of the Association to popularise Tea is evidently being attained, the Tea has become popular, and a nucleus has now been formed for a business, which should be continued after the Exhibition is at an end."

Yours faithfully,

Ernest Tye,

Secretary.

Annexed is a list of the Awards made by the Jurors to the Association and to various Exhibitors.

INDIAN TEA ASSOCIATION (LONDON).

Paris Exhibition.

The following is an extract taken from the Official list of awards :—

Great Britain.—Juror: W. T. Wilson (Messrs. Gow, Wilson, & Stanton).

Grand Prix.

Collectivité des Planteurs du thé Indien (Indian Tea Association, London and Calcutta).

Medailles d'Or (Gold Medals).

The Amalgamated Tea Estates Company, Limited.
The Consolidated Tea and Lands Company, Limited.
The Imperial Tea Company, Limited.

Medailles d'Argent (Silver Medals).

The Anglo-American Direct Trading Company, Limited.
The British Darjeeling Tea Company, Limited.
The Jokai Assam Tea Company, Limited.
The Gielle Tea Company, Limited.
The Hope Tea Company. Limited.
The Moabund Tea Company, Limited.
The Century Tea Company, Limited, Exposition Universelle. (3, Rue d'Alger, Paris; Mr. Langdale.)

Medailles de Bronze (Bronze Medals).

The Bengal United Tea Company, Limited.
The Borbaree Tea Estate, Assam.
The Cachar and Dooars Tea Company, Limited.
The Chalouni Tea Company, Limited.
The Darjeeling Consolidated Tea Company, Limited.
The Doodputlee Tea Company, Limited.
The Greenwood Tea Company, Limited.
The Majuli Tea Company, Limited.
The Okayti Estate, Darjeeling.
The Poobong Tea Estate, Darjeeling.

Mentions Honorables.

The Attaree Khat Tea Company, Limited.
The East India Tea Company, Limited.
The Ethelwold Tea Estate.
The Jaipur Tea Company, Limited.
The Assam and Dooars Tea Company, Limited.
The Turzum Tea Estate.
The Jaipur Tea Company, Limited.
United Planters' Association, Central Travancore.
United Planters' Association, Nilgiri Hills.
The Tukvar Tea Company, Limited
The Western Cachar Tea Company, Limited.
The Jhanzie Tea Association, Limited.
The Soom Tea Company, Limited.
The Teesta Valley Tea Company, Limited.
The Thora Jan Tea Company, Limited.
The Woodbine Tea Company, Limited.
The Nagaisuree Tea Company, Limited.

[Inclosure].

48, Rue Faubourg St. Honoré,
Paris, *November 29th,* 1900

I am in great hopes that this my final Report of work done at the Exhibition will satisfactorily show the Committee that the prospects of Indian Tea in France are brighter now even than they were when I wrote on the subject in September last, and that the Association will feel how justified they were in deciding to continue a business which has commenced so well.

As the sale of Tea in the cup was chiefly intended to serve as a means to popularise Indian Tea in France, the Association will be pleased to note what progress was made in the sale of packet Tea.

At their stall in the Exhibition which was opened on 13th June, the sales increased, *pari passu*, in a manner which I think the Committee will consider highly satisfactory. A tabular statement will be given at end of this Report. It will show that to date over 8,000 lbs. Tea have been sold.

The liking for Indian Tea had undeniably increased during the run of the Exhibition, but the increase of sales for the last few days is partly to be accounted for by the fact that purchasers had formed the idea that when the Exhibition closed the price of Tea would be raised.

This opinion was held by the trade, but that such will not be the case is now fast becoming evident to all, and our hopes therefore, are that we shall not lose much ground by reason of the Exhibition now being closed.

That the low price can and will be maintained is, of course, in consequence of the support we have received, and are to continue to receive, from the Association, and which I venture to say is of far better form than that of subsidising grocers, with whom, however, we shall have to reckon later on when Indian Tea is more generally enquired for in France.

Up to the present we have not been able to do very much with the trade itself, for the reason that our price does not permit us to give a discount anything approaching the customary one in France—*viz.:* 25 per cent.—but our hopes are that the present trade price may be modified if we can buy our Tea through more direct channels than we do now.

Infusion.—Owing, as I have already said, to their somewhat unexpected secluded situation, the "Indian Tea Courts" were not easily found by many chance visitors, or by those who came especially to visit them, but once they were found they became the resort of the best society, members of which have been known to say that the Indian Tea Courts were the most *chic* of any in the Exhibition.

Although in such "rushes" of business as occurred in the Tea Courts it was utterly impossible to give entire satisfaction to everyone, the complaints were very few indeed, and then of rather a hypercritical kind. On the other hand, I am happy and content to mention that unstinted and warm praise was given by habitués of the Courts, notably the Princess Malakoff (who, for nine days, took her seat regularly at four o'clock), the Duchess of Mecklenburgh, Baron and Baroness Alphonse Rothschild, and the French Commissary General.

The Baron and Baroness were pleased to say that the Grand Prix should have been awarded the Association for the manner in which the Tea was served as well as for the goodness of the Tea itself.

The prettey boxes of samples were much appreciated by all visitors, and happily by the French in particular. About 30,000 sample boxes were given away during the Exhibition, and the balance of our stock will be distributed in connection with the work to be continued at the Faubourg St. Honoré and 3, Rue d'Alger.

Coffee.—There is a demand for good Indian coffee, and I feel sure a business will be done in it. The quality of that served in the Indian Tea Courts was pronounced by connoisseurs to be very good indeed, and no objection has been raised to the price charged—3 francs a pound (French) roasted—but the great difficulty to contend with has been how to get the roasting process done. We could not do it in large quantities ourselves because of the Tea in store, and we have been unable yet to find anyone whom we can trust not to exchange our coffee for other of an inferior quality.

At the Exhibition the sale of our coffee was comparatively small, because, as in the case of tea, not only were the Courts not easily discoverable, but the various Sections around were closed to the public usually at 7 o'clock every evening, and no inducement was offered by the authorities to anyone to come in that direction. Our "After Dinner Coffee" suffered accordingly. The price in London of the coffee (mark Hosully) was 88s. per cwt. and the French duty is 75 cents per lb., so that for roasted Coffee 3 francs per lb. retail is moderate.

The Coffee itself compared most favourably with any other sold in the Exhibition, so, at least, was the general opinion expressed. At the Exhibition there was no difficulty in roasting the requisite 4 lbs. a day, nor will there be any at No. 48, Rue Faubourg St. Honoré.

I have already, in a letter to the Secretary of the Association, mentioned that a gentleman interested in the Army Commissariat Department has tasted the Coffee, and expressed himself so pleased with it that he took away with him small samples of it to submit to higher quarters.

Any Coffee, however, supplied to the Commissariat would necessarily have to be priced low—say 2 francs a French pound delivered. Tenders for the contract would have, of course, to be made in the usual course. The United Planters' Association may feel inclined to take up this matter and arange to deliver Coffee *viâ* Havre—the cheaper route. I will obtain all particulars possible.

Reckoning that about 4 lbs. of Coffee were used a day for 50 cups *café noir* and *café au lait*, 10,500 cups, or 7½ cwt., was the result. This seems small spread over the whole period the Exhibition was open, but the demand depended chiefly upon early customers, there being little inducement, as I have attempted to explain, offered to anyone to visit "India and the Colonies" after dinner merely for the sake of having Coffee in the India Tea Courts, though these were rarely closed before half-past nine.

For the reason already given in letters to the Secretary, the sale of Coffee in berry was not so easy as I first hoped it would be, as, in consequence of a protest made by many grocers in Paris against the sale of packet Tea at the Exhibition, the authorities took steps to have the stalls, both of Ceylon and India, closed. They, however, were not closed, but we deemed it prudent not to give publicity to the fact that we also sold Coffee.

To revert to Tea.—By a calculation of mine that on an average no one person ordered less than 75 centimes' worth of Tea in the cup, the 69,500 francs receipts represent 96,400 pots of Tea (two cups in each), but that number is considerably under-estimated because so many people often ordered pots of Tea for a smaller number than their party consisted of, and also extra cups for the rest.

Tea for two and cups for three, four, and five was an order frequently executed. As also hot water in addition was served, sufficient for other two cups, the quantity of Tea drunk by each person was, of course, much increased. I have not taken that into my calculations, but only the number of pots of Tea served. Putting it, however, at a reasonably low figure, I believe that not less than fifty to sixty people were every day served with extra cups without having to pay anything, except a penny, for the accommodation. At this rate, in the 210 days of the Exhibition, 10,000 cups of Tea can be added to the 96,400 pots accounted for.

The French do not always take their Tea as the English do, but they persevere in their attempt and evidently wish to like the beverage.

Some more often than not dip their bread and butter and even cake into the cup of Tea they are drinking, and some novices seemed to consider the Tea was a kind of grog to be mixed with the hot water, which they poured into the cup first. Others poured the Tea into the sugar basin, half the contents of which they had previously eaten, and then into the hot water jug, and from that into the cup. Or, for another change, they would partially empty the milk jug and then pour Tea into that. Our American visitors liked a glass of iced water to drink either with their Tea or after it. I do not mention these little peculiarities for the purposes of ridicule, but rather to show that Tea drinking in France is yet very much in its infancy.

The expert was, of course, sometimes present in the Tea Courts, judging from the procedure of some of the visitors, who, to the great wonderment of the foreign waitresses, would turn the leaves out into the saucer or a plate examine them closely, and then put them back into the teapot, and, having added more water, drink another cup of tea.

I am aware that I am now about to tread upon delicate ground, but as comparisons, sometimes unfortunately of an invidious nature, have been drawn between India and Ceylon, I venture to do so, as I cannot help thinking a totally wrong impression may have been given to some garden proprietors and planters in India who did not visit Paris this year, that their interests were not always in the best keeping.

The circumstances under which the interests of India and Ceylon (not necessarily conflicting, but rather in friendly rivalry) were worked were very different. The Ceylon Commissioner, Mr. Renton, came over prepared to spend money lavishly in the interests of Ceylon tea. He did so, more particularly in the matter of advertisement—whether wisely or

not, it does not become me to say—but I do know that the Press were, so to speak, "nobbled" to the extent that, in their judgment, India was of secondary importance. I venture, however, to say that India with a less expenditure has, in comparison, done as well as Ceylon. An extensive free list, and money paid for notices in the newspapers, of course, will always draw—for a time—as also do subsidies of another kind, and neither method adopted by Ceylon has injured India, but, on the contrary, has helped it. At this Exhibition, Ceylon had in their tea pavilion more than three times the accommodation India had in theirs—700 chairs against 200—and they worked under the direct auspices of the Ceylon Government. Between all the officials of the Ceylon section, notably in that part relating to tea, and myself there has always existed the greatest friendliness, even to the extent of borrowing supplies of each other, and I do not impute to them any wish not to share some of their glory with India. Both have done good in France in the interests of Tea.

Still, I cannot help thinking there were occasions when errors made by the Press might have been corrected by our friends, and wrong impressions thus prevented. To give only one instance: When the President of the Republic visited India and Ceylon he was received in the former, at the entrance to which stood the Indian Tea Court girls dressed in costume, from one of whom the President accepted in a most gracious manner one of the pretty little sample boxes of tea. So also did his retinue and many members of the Press, who at the same time made their notes concerning the Court. I was, as the Indian Tea Association's representative, personally introduced to many of the Press, notably the *Siécle*, which paper is particularly Anglophile. The President spent some time in the Indian Section, and then passed rapidly through Ceylon to Japan, so rapidly that there was no opportunity for the Ceylon Government delegate to present him, as he had intended to do, with a beautifully illustrated official catalogue of the Ceylon Court. The next day the Press gave all the honours to Ceylon, and the *Siécle*, to my particular surprise, reported, amongst other details, that the President visited the *Ceylon* Court, and that a charmingly-costumed girl belonging to the Tea Court there had presented him with a pretty little box containing a specimen of the island's tea! The other papers gave similar accounts, and in other ways misrepresented what had occurred. The representatives of two papers offered to give me small notices at the rate of about three or four hundred francs. I was unable to accept the offers, and their reports next day made no allusion at all to India!

Ceylon did not offer any explanation of the mistake I have mentioned, and which perhaps would not have been an unnatural one for the public to make, for at that period there was nothing except the exhibits to indicate which was the India Section.

The Exhibit of Tea in the Commercial Court attracted much attention, more particularly so as the Tea sales stall was close to two of the show cases. The light, however, was not good, and although, with the object of showing up the Tea better, I did not fill the globes more than three-quarters full, the Exhibit at certain hours of the day was not so effective as could be desired. I may mention that the Exhibit of very fine tip from some of the gardens, apart from all other merit, was most useful, in that many of the purchasers of our packets became disabused of the idea that Tea with tip in it was not good, but contained some foreign matter.

I do not know if it is within my province to allude to th "judging," for, of course, the reputation of the gentlema appointed by British Commissioners for Juror is undisputed but I may, I hope without presumption, ask to be permitte to say that no one could have taken more pains than M Wilson did to have the Tea properly judged and the award fairly given.

All the samples, more than 400, which were in the sho cases were carefully examined in the leaf by all the Juro of Class 59, who, however, not being experts in Tea, ofte deferred their opinion to Mr. Wilson and that of Mr. Derod the latter the only French expert on the Jury, and I woul particularly mention how hard Mr. Wilson fought to hav awards given to individual gardens independently of th Grand Prix which was to be awarded to the Indian Te Association for the collective Exhibit, and how, too, he wo his point in spite of very great opposition offered seemingl only on technical grounds.

The Gold Medal for Coffee was, by a clerical error, first o all awarded to Ceylon, but was ultimately given to the Unite Planters' Association of Southern India, after repeated an strenuous representations on my part.

SUMMARY OF QUANTITY OF TEA IN PACKETS SOLD AT THE EXHIBITION AND AT DEPÔT, 3, RUE D'ALGER, PARIS.

EDWD. F. LANGDALE.

* * *

The Indian Tea Association (London) and the Ceylo Association in London have jointly issued the following cir cular, dated London, 18th January, 1901:—

Restriction in Output of Tea.

The Select Joint Committee of the Indian Tea Associatio and the Ceylon Association in London, appointed to conside the proposal for a reduction of output of British-grown Te has carefully considered the subject from the standpoi of both of the producing countries, and begs to report a follows:—

1*st*.—That they are of opinion that no scheme has bee propounded that is sufficiently comprehensive and would ac as efficiently and be so likely to effect the required results a that of a diminution of output by a restriction of the pluckin area of mature Tea.

2*nd*.—That this can only be brought into operation by joint agreement between producers in both countries.

3*rd*.—That as it would be impossible from the widespre nature of the proprietorship and control of Tea Estates obtain the adherence of all producers within a reasonab time, they, therefore, suggest that if a reduction in the acrea to be plucked equivalent to a minimum output of 10,000,0 lbs. of Tea from India and 8,000,000 lbs. from Ceylon can

ssured by the adherence of producers to the scheme, then he object in view would, in all probability, be attained.

4*th*.—That with regard to the compulsory scheme proposed in Mr. H. K. Rutherford's letter, of 4th instant, with pecial reference to Ceylon, the Joint Committee desire to say hat if there is adequate support from Indian producers to he general scheme, it might be found the best and simplest lan in Ceylon, where there are a very large number of ndividual proprietors, that an unanimous representation hould be made to the Ceylon Government to pass a compulsory ordinance.

5*th*.—Annexed is a proposed form to enable proprietors o signify their adherence to the scheme, but prior to their eing requested to do so it has been decided to hold a joint Meeting of the Members of the two Associations to consider his Report.

For Ceylon Association.

Annexure.

I / WE hereby undertake for one year from 31st March, 1901, to reduce the plucking area of mature tea on the / on Co.'s Estates / or Estate by 10 per cent., provided producers in India / Ceylon agree to reduce their output by not less a quantity than 10,000,000 lbs. for India and 8,000,000 lbs. for Ceylon during the twelve months ending 31st March, 1892.

Name of Company or Estate.	Mature Acres of Tea.	10 per cent. of Area.	Estimated yield of 10 per cent.

(Signed)_____

COFFEE IN DISTANT LANDS.

XXIII.

Queensland.—Many of our readers will be interested in the following extracts from the report of the Instructor in Coffee culture to the Government of Queensland.

I have made tours into the surrounding coffee districts, giving advice and demonstration to those who applied for it. . . . In detail the places visited, and where coffee is grown, include Cooktown, Daintree, Port Douglas, Cairns, Atherton, Myola, Oaklands, Mantaka, Kuranda, Mulgrave, Lower Russel, Clump Point, Mackay, Mount Jukes, Hampden, Rockhampton, Byfield, Yeppoon, Maryborough, Pialba, Bundaberg, Blackall, Coolum, and Buderim. Space would not admit of even short notes regarding each individual district and place where coffee is being more or less cultivated. In general, however, I found from Cooktown southward to near Townsville a zone of country having a somewhat heavy rainfall—eminently suitable for the cultivation of coffee, but possessing a climate that will necessitate artificial methods of drying by means of kilns or drying machinery. At Cooktown and Townsville, and as far south as Rockhampton, the climate is such that there is every probability of growers being able to dispense with kilns and to dry in the open air, which, when possible, is always the more satisfactory method. South of this, again. the absorptive power of the sun is less strong, but, the atmospheric moisture not being great, it is probable that open-air curing may be possible. There is at present scarcely sufficient fully-grown coffee in these parts to thoroughly test this. The majority of gardens are small, though I found several of fair size, the largest being Messrs. Cutten Bros.' estate at Clump Point, of 80 acres ; Messrs. De Moleyns Bros., of the Lower Russel, running them very closely with 75 acres. There is very little coffee in cultivation of more than five or six years of age, the majority being either now in its second year or bearing its maiden crop this season. Some few acres in each of the three districts of Cairns, Mackay, and Buderim may be called old coffee, but their exact age is in nearly every case, doubtful. The first coffee-tree ever imported has been pointed out to me, and it is healthy and flourishing ; but, as this has occurred in several different localities, its exact age is somewhat vague.

The varieties of coffee to be found are *Coffee Arabica* and *Coffee Liberica*. The former is the principal species, and is the usual coffee of commerce, and the most valuable, growing and cropping readily. It is comparatively easily cured, and, though delicate as a seedling, is hardy enough once it has reached maturity. The latter is the larger and harder shrub, but is more difficult to pulp and cure, and is only worth about one-third the price of *Coffee Arabica*.

Of *Coffee Arabica* several varieties are noticed :—*C. Arab.* var. *Mocha*, a small stunted-looking and small-leaved tree, slow-growing bearing freely, but having a very small bean ; *C. Arab.* var. *Maragogipe*, almost the opposite of the former, being a loosely-knit tree, with large leaves and berries, but somewhat delicate, and a sparse bearer ; *C. Arab.* var. *Nalknad*, which would seem to be identical with the varieties known as "Ceylon" and "Java"—a strong, heavily-bearing tree ; *C. Arab.* var. *Coorg* a variety having very few points of difference from the previous variety, and being also a hardy tree and good bearer ; *C. Arab.* var. *Chick*, I have come across in one place only, and this is essentially the worst variety of *Coffee Arabica*, recognisable readily by its primary branches pointing invariably upwards.

Of these, several hybrids are to be seen especially between the *Nalknad* and *Coorg* or *Ceylon*. These prove somewhat delicate but good-bearing trees. *Chick-Nalknad* or *Chick-Ceylon* hybrids are extant, and in every case seem to have been raised from seed obtained from the estate on which some healthy specimens of "Chick" are still to be found. Several young plants are to be seen that look uncommonly like *Maragogipe-Ceylon* hybrids, but which are not yet old enough to identify as such. Such hybrids would probably prove valuable trees, if the bearing capabilities of the *Ceylon* can be combined with the size and quality of the *Maragogipe*. *Arabica-Liberica* hybrids I have not seen in this colony as yet, though experiments are being conducted at the State Nursery, Kamerunga, with a view of obtaining this valuable hybrid.

On the whole, the condition of the estates as I found them

was not encouraging—in some cases the weeds were over the coffee. Where the coffee had been kept clean, the growth and bearing were remarkable. For amount of crop the Buderim mountain is noticeable, the quality being also specially good here. On the Daintree River one or two estates that had been kept assiduously free from extraneous growth showed remarkable development, trees of thirteen and fifteen months being topped at 4 feet, having a good spread of secondary growth, and spiking heavily, showing promise of a 5 to 6 cwt. crop that would ripen when the trees were not more than two-and-a-half years old. For all-round good qualities some of the properties in the vicinity of Cairns, especially on the range about Kuranda are pre-eminent.

To summarise the area especially adapted to coffee culture may be said to extend from Rockhampton northward to to Cooktown, and the principal centres to be at, or in the vicinity of, Mackay, Geraldton, Cairns, and Port Douglas. The places that I have yet been unable to visit are Bowen, Cardwell, Geraldton, Johnstone River, the Bloomfield, St. Lawrence, and Percy Island. . . . Figures regarding the extent of the industry, . . . are still necessarily approximate rather than exact, statistics later on.

There would appear to be some 200 growers, aggregating 700 acres or more. I have not included in this the areas that have been allowed to lapse during the past year, and which amount to over 100 acres alone. The industry is now on a much firmer and better footing than last year. I found in some instances that areas had been opened by growers (perhaps in an excess of enthusiasm) without experience, knowledge of coffee culture, or consideration of the natural conditions governing the growth of coffee-tree, which they were in consequence subsequently utterly unable to cultivate or properly attend to. In such cases I have advised the concentration of attention upon some lesser part of the estate, and the selected portion. The result of such work on the part of the grower has been to reduce the extent of the industry, but to put their estates on an infinitely better footing, financially and otherwise. The increase of area under cultivation is steady, though not rapid, for the same reason. Under my advice, those intending to open up are clearing perhaps 4 or 5 acres to begin with, in the place of 20 or 30, but with the obvious result that what is opened is well cultivated, satisfactory, and in a condition to pay the cost of subsequent openings in due course, instead of large and unsatisfactory estates, which, being difficult to keep clean from the commencement, are ever after a source of extra expense in weeding alone.

The number of applications for seed and advice *re* opening up is increasing, and the areas reduced will, it is to be expected, be more than made up during the coming year by these new clearings. The value of the industry cannot be gauged by the mere acreage, coffee being considerably more valuable than most farm staples. The area under coffee in the colony at present is capable of giving easily—with ordinary cultivation and no manuring—an average of 10 cwt. to the acre, a crop worth some £20,000, and possibly giving a crop worth at the same valuation £25,000 to £30,000 annually.

The improved methods of work started last year are showing good results, the samples of coffee at the various shows improving vastly, both in size, shape, and colour, and showing better and more satisfactory returns both to the grower and buyer. At present, practically all the Queensland grown coffee is bought up and manufactured in the colony, the prices remaining fairly steady at from £56 in the parchment to £1 per ton clean according to sample. Last season some buye complained of the quality of coffees received, owing to t loss they sustained in both weight and bulk on manufactur This I found to be due, to a great extent, to the insufficie drying of the crop before hulling. In hulling insufficient dried coffee the quality of the manufactured article is serious impaired, and loss in weight of from 30 to 35 per cen sustained. It is not always easy for growers to dry thorough in bulk, but it was possible to very greatly improve, in th matter alone, on last year's work, and this has been ver generally done. Growers see the advantage of drying th roughly, and having buyers ask again for consignments, an buyers appreciate the absence of heavy losses in weight an possible loss by mould, etc , on storing an advantage that satisfactory to both parties, and one that has resulted in a apparently newly-discovered improvement in the quality colonial coffees generally. The improvement is very notice able in the manufactured articles now being put on the loca retail market.

Coffee is being put on the local market in tins, well go up, and of very good quality, at from 1s. 6d. to 1s. 9d. pe lb., and the local sales of such would tend to show an increas and increasing consumption of the commodity. Local manu facturers are finding, as was to be expected, that they hav to purchase from smaller growers to supply the demand—a healthy state of affairs that will, it is to be hoped, continue enabling small estate owners to dispose at once and for cas of the raw article. Seeing the apparently large price obtained for coffee per lb. manufactured compared with the price i the raw, there seems to be an inclination among some of th growers to attempt the manufacture individually, which is t be deprecated. The putting on the market of an unlimited number of brands would result, in course of time, in lowering of prices, adulteration, and reduction of quality The grower will find it pay better to sell in the parchmen than to spend the time in manufacturing small quantities and *vice versâ* the manufacturer will find that the work en tailed and time occupied in manufacturing will not admit o the proper working of an estate of cultivation of the coffe also.

The prospects of the industry are decidedly good. Tha the sample, when properly treated, is of high-grade quality has been amply demonstrated this season, and, in spite o labour competition in other countries, it has also been de monstrated that the colony's natural advantages can compet with them, by the fact of a high-grade coffee being put o the retail market at the same or a lower figure, with a fai margin of profit to both grower and manufacturer. The re moval of intercolonial tariffs will also open up the Austra lasian markets to this staple of Queensland, and in the hom markets the prices are slowly but surely rising.

From the grower's point of view it is one of the most pay ing of products, giving a return of 10 cwt. and, possibly, 15 to 20 cwt. crop, which, at even 6d. per lb. in the parch ment, or £56 per ton, would mean £28 gross, or a net retur of from £15 to £20, at least per acre. In the present state o the industry it seems to be inadvisable to open up large area for various reasons, and smaller gardens are more readil managed. Most of the growers have, at present, also smal areas, and, in consequence, coffee is looked upon, to some extent as a by-product. It will, undoubtedly, prove a very valuabl by-product for any farmer, though with due attention t

ltivation it will be found, as it is already in several in-ances, a profitable crop to grow as a sole staple, the returns ving a good living And as the colony becomes more pulated, large areas will be possible where, at present, labour fficulties practically prohibit the opening up of, say, a 0-acre estate.

Want of experience and carelessness in opening up coffee ardens can account for considerable loss and disappointment the colony ; ignorance and inexperience of coffee culture, many instances, only showing in the second and third year. he necessity for ordinary attention at the area planted up in rder to ensure satisfactory results cannot be too strongly welt on.

The initial three years or so of waiting before any return an be obtained has, unfortunately, been the cause of the eglect of even the fundamental laws of agriculture, occasion-lly, with the result that the field has either taken four or five ears to come into bearing, or that the trees have been so etarded and hampered in their growth that when the strain f the maiden crop was felt they were found to have no tamina to carry it.

Coffee is perhaps one of the most responsive of any fruit-ree to cultivation, and it is certainly one of the most pro-itable, but at the same time, not being indigenous, is very usceptible to neglect, and easily damaged and stunted by veed growth, etc.

NOTES

Ceylon Green Teas. Payments made up to 31st ultimo under the Ceylon Green Teas Grant, 1900-1901, scheme totalled Rs. 36,760·43.

Colombo Tea Sale. At the public sale of tea at Colombo, on the 30th ultimo, about 11,566 packages = 942,011 lbs. were offered, of which about 7,920 packages = 640,763 lbs. were sold.

The Indian Economic Products Department. The Government of India has sanctioned the appointment of Mr. Isaac H. Burkill, M.A., F.L.S., to a post in the Economic Products Department, under Dr. George Watt.

Vanillin—The Estimation of. Burse estimates the amount of Vanillin in vanilla by triturating the vanilla with washed sand, and then exhausting with ether. This is then shaken in a solution of sodium bisulphite. The vanillin is then extracted with dilute sulphuric acid, from which it is taken up by ether and evaporated.

Mexican Vanilla. According to Zemcke, six different varieties of vanilla are found in Mexico, known locally as *Vanilla mansa*, *cimarrona*, *mestiza*, *pompona*, *puerco*, and *mono*. Of these the only ones cultivated are *mansa* and *pompona*. These appear from a careful examination to be identical with *Vanilla planifolia* and *V. rotundifolia* respectively.

London Tea Market. In their weekly cable, dated 1st instant, to Colombo, Messrs. Gow, Wilson & Stanton stated that buyers were operating very cautiously. The average of Ceylon Tea for the week was 6⅜d., a drop of ⅛d. per lb. Of 40,000 packages offered 37,000 were sold. Out of 60,000 packages Indians offered 52,000 were sold. Average 7⅛d. or a drop of ⅞d. !

A Phosphate Combination. A movement is on foot in Florida to amalgamate the phosphate-producers of that State, and at least twelve important concerns out of fifteen engaged in the business are likely to be combined. The industry has reached a high stage of development in Florida, the figures showing that in 1899 776,000 tons of phosphate was shipped from that State.

Calcutta Tea Shipments. The following figures of Tea exports, taken from the Calcutta Customs daily entries, are issued by the Indian Tea Association :—Quantity of tea entered for export to the United Kingdom for the second half of January, 1901, 5,099,379 lbs. ; quantity entered during the corresponding period of last year 4,626,960 lbs. Total from 1st April, 1900 to 31st January, 1901, 156,064,213 lbs. against 145,571,117 lbs. in the preceding year.

Ramie. During his visit to the Peradeniya Gardens, Ceylon, Mr. Bluntschli, the Sumatra ramie-planter, was shown a species that was new to him, *viz.*, *Bœhmeria pulchra*. This seems to contain as good a fibre as any of the family, and is easily grown. *B. nivea* Mr. Bluntschli considers the best, and he confirms local experience (in the Gardens) by condemning the variety *tenacissima*, which is often said to be the best variety for high elevations.

Coffee in England. A Mincing-lane Broker, writing to the *Daily Mail* recently, delivered himself thus :—The root of the evil lies in the fact that in England people will drink "plantation" coffee. In France they drink sun-dried coffee. On East Indian and Ceylon plantations the coffee-berry, directly it is picked, is freed from all saccharine matter by a process of fermentation. But with sun-dried coffee this sweet substance is absorbed by the bean. This is the true reason why English coffee is so bitter.

Irrigated Tobacco. An American tobacco-grower is trying the effects of irrigation on his tobacco land. He expects to insure a future yield of upward of a ton to the acre annually and that without excessive manuring. Timely water will take the place of much of the manures now required. The irrigation of tobacco, however, is a new thing, in the experiment stage, and the results upon the leaf and cure are yet to be learned. Irrigation of tobacco is also likely to add new problems to the successful growing of the cigar leaf crop.

Cattle-ticks. The Queensland Chief Inspector of Stock reports that he finds Christian's dip the most trustworthy for the treatment of cattle for ticks. The formula is arsenic, 10 lbs. ; soap, 5 lbs. ; soda-ash, 28 lbs. ; Stockholm tar, 7½ gals. ; water, 400 gals. Cattle dipped twice at an interval of ten days between the dippings were found to be completely freed from ticks. The inspector mentions that dipping-tanks are as a rule too short. Cattle ought to remain in the bath from 40 to 50 seconds, and the tank should be from 36 to 80 feet long.

Fiji Products. Sugar appears to be the chief product. Coffee grows well, so does Vanilla, which has realised good prices in the open market. Tobacco, ramie fibre, cocoa, cinchona, tea, and India rubber are all to be found in Fiji. Tea does exceedingly well, and has a delicious flavour, says Mr. Finucane. There were, when I went to the Colony, two flourishing estates with a perfect soil and altitude for the growth of this beverage : at present the local consumption of the product is entirely drawn from the group, and it is also exported to New Zealand and Australia.

Gutta-Cultivation in Java. The subject of gutta-percha cultivation in Java has been brought before the States General. The Minister for the Colonies explained that the Government intend to start gutta-percha plantations in Java only. There the soil and climate favour the undertaking, and labour is cheaper than in Sumatra and Borneo. A beginning will be made with planting on a large scale the *palaquium* variety, which has been found to thrive very well. Within the next five or ten years, it is intended to plant large areas with three kinds of this variety. The Director of the Government Botanical Gardens at Buitenzorg will be charged with the supervision work at the outset.

Japan Teas in America. A. U. S. contemporary writes :— The demand for Japan tea which was noticeable last week from the country has continued to the present time, and we now hear that the inquiry is being passed on to the jobbing houses. This indicates that stocks in second hands are extremely light and that goods will be urgently needed after Christmas. There are some houses in the city who have not as yet bought any new Japan tea, fearing to buy at the high prices and managing to get along on old goods. These will be cleared out within a few weeks, and then will ensue a scramble for new crop teas. Where the desired commodity will come from is a puzzle, for jobbing houses have very few goods on hand, and the Japan market is closed. Many anticipate a post-holiday squeeze. Wholesalers are asking 17 to 20c. for new Japans.

Hemp as a Money Crop. This from the *American Agriculturist* may interest some of our readers:— "The Department of Agriculture at Washington has conducted the past season, under the supervision of the division of botany, experiments in hemp cultivation on its trial grounds at Washington and in several localities in the Carolinas. No official statements have been published relative to these experiments, but it is understood there is the possibility of widely extending this industry. In Ky, a considerable area of hemp has been grown annually for many years. This hemp differs quite distinctly from the product of the Philippines, which comes from a tree resembling the banana in its chara cteristics ; Ky hemp is in the nature of a plant and the experiments conducted by the Department of Agriculture show in some instances a growth of 10 to 12 ft. The imports for the fiscal year 1900 of all coarse fibers for manufacturing bagging, rope, twine, etc., amount to $24,000,000."

The Brazil Coffee Market. Messrs. C. J. Leach & Co., in their weekly report on the coffee market, state that receipts at the Brazilian ports continue to diminish, and with the exception of last year the comparison with previous seasons is becoming much more favourable. But even compared with last season it is worthy of note that to da when we have entered the last half of the crop year, the to in the two ports of Rio and Santos only exceeds that of l year by 334,000 bags, and that crop did not quite reach ni million bags. Messrs. G. Duuring and Zoon's month figures show a decrease of 1,200 tons in European stoc against an increase of 6,850 tons in December, 1899. T world's visible supply decreased 14,100 tons in Decemb against a decrease of 10,710 tons in December, 1899. Mess Leach give the deliveries for twelve months in Europe a United States, also the arrivals in both countries, and it satisfactory to notice that the deliveries exceed the arrivals both cases, which is quite an exception.

Development in Bolivia. The wealth of the rubber resourc of Bolivia has been demonstrate fully, but they remain close to the world in large part becau (1) of the sparse population and (2) lack of capital in th republic, but still more so because (3) of the lack of conv nient means of transportation. The only means of transport tion supplied by nature is the outlet through the riv Madeira into the Amazon, and this is rendered almost in passable by numerous cataracts. From a Bolivian sour comes news of a French undertaking to build a railway co necting the headwaters of the river Acre with those of th Madre de Dios, the advantage of which will be that the whol navigable river system of Bolivia can then be connected to th Acre, which discharges into the Purus, and that into th Amazon—thus giving Bolivia access to the Atlantic seaboar without reference to the Madeira. The Acre district no exports about 2,000 tons of rubber yearly. It is estimate that the opening of the region which the proposed railwa would make possible would soon increase this amount t 20,000 tons yearly.

The American Tea Duty. Mr. Mackenzie has sent to th Thirty Committee a newspaper cutting confirmatory of the view that there is little, if any prospect of a change in the duty on tea during this session o Congress. The following extract from a letter written b one of the leading members of the "Committee on Ways an Means," dated Washington, December 10, but is of particula interest : "We were asked when our Committee first assem bled to decide the question whether we would make an reduction in the tariff on tea. The Committee who had ful information on this subject at various times during the pas ten years, and especially since the tax was imposed, unani mously decided that they would not make any reduction i the tariff on tea or any other tariff duty. The parties wh asked to have this matter decided were engaged in the te trade, and said they desired this decision made and published in order to do away with uncertainty, etc., as the uncertainty was damaging the business. Now, of course, the questio could not be opened. I will say for myself if the questio was an open one to-day, I should be very much opposed t any reduction in the tariff on tea. It is what the tea trad has been clamoring for, for years, and now before they hav had sufficient opportunity to judge of results, and while many of them wish to have it continued, others ask us to remove it For one, I prefer to let the experiment be tried. I writ you thus explicitly because I think it is due to the tea trad to know that there is no chance for any reduction of thi duty during this session of Congress even to take effect a year hence."

LETTERS TO THE EDITOR.

PLANTER.—Declined, with thanks.

THE POSITION OF THE TEA INDUSTRY.

DEAR SIR,—I have duly circulated your No. 6, of 19th anuary, 1901, on the Rutherford Rosling Scheme among the ommittee of this Association, and will pass it on to such Pro-ietors and Agents as are not members of the Association due course. In the meantime, I may say in reply to uggestions, *A*, *B*, *C*, and *D*, contained in abovementioned rcular, that my Committee are of opinion, that—

(*a*) Is not merely impracticable, but, for reasons unneces-ary to detail, most inadvisable.

(*b*) Is impossible in these Southern Districts, as tea anufacture is in progress throughout the year. But were otherwise, the same objections apply to this suggestion as *a*.

(*c*) Good average plucking has always been the rule in is District. Nor do my Committee think, that generally ne plucking would be of much assistance to Teas grown at edium altitudes. At the same time, my Committee de-recate the system now in vogue on many concerns, where uality is entirely disregarded, and where the sole object aimed t by a Manager is to place his produce, f.o.b., at a fraction heaper than his neighbour.

(*d*) This last my Committee is prepared to consider, but ould like more definite information before coming to a ecision. Moreover more than one member would insist on he system being universal before consenting thereto.

In conclusion, I may mention, that the feeling in this District is, that there are two remedies for the present crisis, nd towards the attainment of these no effort should be spared. hey are—

(1) A compulsory Cess.

(2) A reduction in the British Import Duty on Tea.

I cannot help saying, that we consider the Indian Tea Association has displayed a singular apathy in regard to hese objects, more particularly as regards the first.

From so large and scattered a community as the Indian Tea Planters it is hopeless to expect unanimity on any subject whatever, and should a large majority prove in favour of a compulsory cess, no effort should be spared to attain the mposition thereof. Ceylon was not unanimous on this ques-ion, but Sir A. Havelock looked at it from a statesmanlike oint of view, and granted the petition of the majority. By doing so, he probably saved the chief industry of the island.

Considering the enormous amount of British capital sunk in the tea industry, also the constantly expressed desire of the Government of India to promote and foster Indian industries, we are of opinion, that we have a right to Government support, and that a refusal at first should not discourage the I. T. A. in endeavouring to attain its ends.

2. Not merely the reduction of the Import Duty on Tea, but an equality in taxation of the principal foodstuffs, provid-ed taxation is necessary, should be pressed. Tea, coffee, cocoa, and sugar may be said to be the four taxable necessi-ties in the form of food in Great Britain. Not one of these can now be looked on luxuries, and, therefore, that one in particular should be selected and taxed cent. per cent. over its market value is to place a bounty on the others, which is manifestly most unjust. Were tea, coffee, and cocoa placed on an equal footing and taxed at, say, 2d. to 3d. per lb., and were 1d. per lb. placed on sugar, there would be an enormous increase of revenue, whilst no hardship would be inflicted on the consumer. As I pointed out in a recent letter to "Indian Gardening and Planting," a working man in Great Britain with a family of five probably consumes ½ lb. tea and 1½ lbs. sugar a week. Were tea paying a duty of 3d. per lb. and sugar 1d. per lb., the incidence of taxation would fall on him at precisely the same rate as it at present does. The confectionery trades would not suffer in any way, for the additional cost of sugar to those trades would, from the nature of the trades, be almost a negligeable quantity, and moreover the trades are patronized by those who can afford to bear the burden. But even the poorest in buying, say, 4 ozs. of sweets for a child would not object to the additional ¼d. in the cost. Were the Indian Tea Association, backed by that of Ceylon and aided by the great Tea Dealers and distributors, to start an agitation in Great Britain and place the matter fairly before the public, we are strongly of opinion, that we should ultimately see the relief we ask, as also a very strong stimulus given to the consumption of tea.

GRANVILLE L. ACWORTH,
Chairman and Ag. Hon. Secy., C. T. P. A.
CENTRAL TRAVANCORE PLANTERS' ASSOCIATION,
Peermaad, 1*st February*, 1901.

RESTRICTING THE OUTPUT OF TEA.

SIR,—I see from the telegrams that a meeting of share-holders in London agreed to the necessity of reducing the output of tea. A very praiseworthy resolution, but how is it to be carried out? Such proposals as have been made with this end in view seem, from a practical planter's standpoint, impossible or at the least non-effective.

Mr. Rosling's proposal virtually amounts to one-tenth of the acreage being left unplucked for two years. Even suppos-ing the owners agreed to this there are several reasons that make it impracticable. The first of these lies in a question. Would output really be materially reduced by the scheme as it stands? On almost all Tea Estates of a larger acreage there are patches which may well total up to 10% and which, from one reason or another, do not yield well, sometimes hardly at all. Is there not a danger of planters choosing those patches, and who is to prevent them?

The second reason is the almost insuperable difficulty of checking such acreage, especially if, as from above seems likely, it would be in little blocks here and there. I do not mean by either of the above that planters are not, as a rule, nay as more than a rule, honourable men, but to get every-body to come into a scheme of this sort you must have definite and easily ascertainable lines to go upon and stick to. My last reason against the scheme—there are probably others—is that the unplucked patches would, as they grew up, be diffi-cult to get into and to keep clean.

Another proposal is, I believe, that bushes should be left unplucked for one month in the year.

Here again a question is the answer: "What month?" Perhaps Northern India would suggest a Winter month when no plucking is done in any case, perhaps Ceylon and Southern India would "per contra" suggest a heavy monsoon month when yields are small. Here is matter for controversy and for endless delay. Besides, what about the estates that still

pay well at present prices ; would owners agree to sacrifice a whole month possibly from varying reasons their best month?

Then there is the third proposal to pluck fine. But the low country will cry to the up country "you pluck fine in any case, if we come down to a bud and two leaves what will you do?" And the up country will say to the low country "sorry but we can't reduce to half our yield for what would primarily benefit you."

Having said thus much against the various schemes propounded, I would suggest that, merely from the planter's point of view, there is a possibility of carrying out a modification of Mr. Rosling's proposal. It would do away with the objections I have raised to this at all events. Almost all Tea Estates are well lined, the worst sufficiently well to answer the purpose of my proposal. When not lined at all approximate lines could be run through clearings with very little trouble. You will already have guessed at the modification I propose, but for the sake of those who are not good at acrostics here it is "That every tenth line in every Estate be left unplucked for two years from, say, the 1st of April next.

Now provided this were agreed to it could easily be checked, it would after a very short time be patent from even a very considerable distance and through good tea and bad it would run alike. The various Planters' Associations could easily make themselves responsible for seeing that it is carried out and it would probably benefit all the tea in acting as a break-wind and a fence against the spread of some diseases. It would affect the output equally whether of high-grown or low-grown tea and perhaps best of all it would break the hideous monotony of a tea district. It would remind the faded planter of his own English hedgerows and, seriously speaking, I believe that in a great number of instances the benefits derived from it would be so conspicuous, that even after the two years were over numerous Estates would stick to their tea fences.

But—will the owners or say over 90 % of them agree to issue the order? It will mean actual salvation to many, higher prices to the rest if they do. But, again, will they? Let the big companies had the way and agree amongst themselves ; let them, through their brokers or agents, get the adherence of private owners. Let it all be conditional on 90 % joining. But when the 90 % have joined let the orders go forth from London and the whole thing can be finally arranged in a month's time. It means no heavy work for superintendents, it just means marking out the lines, it can be done in a few days.

It is its simplicity that recommends it beyond everything and, I believe, if owners were really in earnest in their resolution passed they may agree to it. As to the remaining 10 % outsiders one would have to try and enthuse or worry them into joining.

Personally, I am a private owner of high-grown tea but, conditional to the 90 % joining, I would agree to join and so would most other private owners, I believe, and even more certainly those at a lower elevation.

But I would not join in Mr Rosling's unmodified scheme, even if 99 % joined, for I could not believe in or be bothered by it.

I am not certain that some insuperable obstacle will not occur to others, I only state that, if output is to be decreased, this is the simplest and most effective way of doing it, just because the idea is a most simple one. As such, I submit it for what it is worth.

But if carried, Java or 90% of Java, must be got to agre as well. I have little doubt it could be induced to do so wi lingly and will, therefore, not refer to any possible pressure.

In another letter I purpose going into the questions reduction of import duty and of the foreign tea fund.

"HERMIT."

SIR,—In my last letter I dealt with what seemed to me th only possible and practical way of reducing production of t in India, Ceylon. I see that in your leading article of Jan ary 26th you declare yourself opposed to any reduction the output. Generally speaking your economic principle as there enunciated, are correct. Whether they apply to a emergency situation might be successfully combated. In temporary crisis a temporary tonic has often to be applied the markets of other commodities in the shape of a limitatio of output (I need only instance cotton mills and silver mine why not to that of tea? However, without going further in the correctness or error of your views, as applied to the pr sent crisis, the fact remains that possibly a good many those interested in tea may share them, and thus make th limitation of output impossible, however desirable it ma appear to others.

As I understand your position and that taken up by thos who would oppose a reduction of output, it is this : "Do n adjust supply to demand, but create or extend demand b supply." Let us now see whether the two opinions migh not be brought into line, or sufficiently so to make the acceptable to both parties and thus ensure united action.

For "output" let us substitute the words "export Great Britain." If the exports of tea to "Great Britain could be reduced and stocks there diminished, the necessar fillip would be given to the home market and this agai would react on the Colombo and Calcutta markets.

"But how," you will ask, "can this possibly be done unles production is reduced ; what is to become of the tea which not to go into the home market and for which as far as w know there is no other market?"

Let us suppose that it is possible, that it is agreed to an that the following would be the procedure.

Each manager of an estate would be instructed to mar every tenth chest in some special manner as he packed an to consign it to a Committee established for that purpose Colombo and Calcutta. He would furnish returns of thes chests and of his general outturn to the local Planters' Asso ciation, and it would be easy enough for the latter to see tha he was carrying out the agreement and not sending more his good tea to the market and more of his inferior tea the Committee. B. O. P. and Flowery Pekoe might b excluded from the arrangement.

The Committee would classify the tea, adjusting it to th possibilities of various markets. It would then ship the tea not to Great Britain, not to Australia or New Zealand, bu only to such countries in which efforts are now being mad to capture the markets for British grown tea, especiall America and Russia. Here the tea would be handed over t the Agencies of the American and foreign tea funds. Th latter would be charged some price considerably below marke rates so as to enable them to absolutely and hopelessly un dersell China. Japan teas (the question of green teas woul here have to be dealt with) in fact to flood them out. How ever low the price may be put at, the funds obtained fro

ch sales would form a considerable item, which would be pended in advertisements of an extensive nature and lance, if any, handed back to producers *pro-ratâ* at the d of every year. India might well be included in the untries thus to be campaigned, but special care would ve to be exercised to prevent the subrented dealers from selling for export, instead of consumption in the country. or should any but lower grade teas be thus distributed in ndia, so as to prevent competition with the established local ade in better teas.

The agreement to carry out this scheme would originally be or 2 years from, if possible, May of this year, thus ensuring wo full seasons.

The reasons against this scheme, as opposed to that of eaving a portion of the tea unplucked, are that the estates would lose not their leaf merely, but their manufactured tea nd that the hedges of tea eulogised in my last letter would ot come into existence. On the other hand I believe that, even in the present scheme, the apparent loss would be more han covered by a corresponding rise in prices for the balance of the tea. But beyond this the improvement might be look-ed forward to as a more lasting one, as new markets would have been thoroughly opened out. It may be contended that these markets, having been conquered on fictitiously low values, they would be lost again, as the agreement came to an end, but tho' this would be the case with some articles of commerce, it would not, or only to a limited extent be the case with tea. For the popular taste would have been educated up—or is it down—to British-grown teas and would demand to be satisfied, even at slightly enhanced rates. Nor is there any absolute reason why the agreement should not be renewed after the two years are over, if producers find it paying them as they are likely to do, in fact some such provision should be made in the agreement, so as to prevent the possibility of discounting futures and "bearing" on heavy present stocks. At the same time, tho' for the two years certainly no export duty would be required if the scheme came into action, it would give us time to persuade Government as to it's necessity in the future.

But in this as in any other scheme a largely preponderating majority of those representing the total acreage under tea in Ceylon and India would be necessary to carry it through. This, I fear, will not be arrived at in any scheme until a considerable number of planters and shareholders have been badly hit and the lucky-go-happy spirit of both has been severely disciplined by adversity. But until such events have forced combination much can be done in supporting the effects of the Indian Tea Association addressed to the Government of India as set forth in their admirably worded petition. Nothing can be added to this. It deserves and demands the support of the Indian Government and is supported already by the resolutions lately passed by the Ceylon Planters' Association. And in this direction at least unanimous action can and should be arrived at, every nerve strained and no cynical replies from the Chancellor of the Exchequer accepted.

But the movement set on foot in this country and Ceylon, however considerable, is doomed to failure standing by itself; may even supported by the Indian and Ceylon Governments it would be so doomed. For let us not fool ourselves with the notion that "Out of Great Britain" industries will be considered if they are British. That consideration is reserved for non-British Interests. We need not go beyond the ruined West Indies and Mauritius to realise this. But if the point of leverage for agitation were changed, matters might be different and success might attend the efforts now started.

And here let me begin by calling attention to a point which has not been sufficiently realised in the discussions on the subject, but which has a considerable bearing upon it and is likely, if properly worked, to give us the right "point d'appui." It is this: there are very few tea-estates now held by resident private owners. Most estates are owned in England and chiefly by big or smaller Companies, whose shareholders live in England. It is very evident that action taken "*en masse*" by these owners and shareholders who live and spend their money in England would have a very different effect from that of the members of Planters Associations, the mere "working bees" out here. It is at home then that such action should now be taken in the shape of a protest and every agent's, every owner's, every shareholder's name should be attached to it. Such protest should fully quote the appeal of the Indian Tea Association to the Indian Government and the speeches and resolutions of the Ceylon Planters' Association. It should again bring forward the arguments adduced by Sir Henry King. It should add to these by pointing out that, even in the immediate future, the amount to be realised from the extra tea duty would be to some (and that not an inconsiderable) extent reduced by the lesser income tax paid on tea shares and by private tea estate owners resident in England and that beyond this revenue and trade must be adversely affected by their reduced incomes. It should argue that therefore it is possibly doubtful whether the actual as against the apparent gain to the treasury is so considerable a one, as to warrant the certain future loss.

In fact agitation must take the place of protest and it must be loud and emphatic, so that the English people generally and its representatives in Parliament more particularly may realise the fact that a Great British Industry with millions of English Pounds invested and thousands of Englishmen dependent upon it for an income or a living, is being jeopardised by an import duty which is from 100 to 200 % *ad valorem*.

It may well be asked "is this what Free Trade leads to, are these the means that have to be assorted to to raise a little war tax in a rich country such as England?"

Supposing India and Ceylon belonged to France or Russia, nay, supposing they were self-governing Colonies, is there any doubt that they would claim and successfully claim a reduction in this British Import duty? But because here it is a case of her own sons raising the cry and since they are unable to enforce their claim or retaliate, they are left to cry in the wilderness of official "insouciance." There has been considerable commotion at the idea of France raising the import duty on coffee and tea but is not a reply self-evident! "You do it to your own children, why should we not do it to aliens?" So far we have been content with an appeal "*ad misericordiam*" but that must cease, our watchwords must be "let there be light, let there be justice!" Shareholders and owners must bring a glaring light to bear upon the subject and claim justice, not beg for mercy. The reply to this will, of course, be the hackneyed one: "But the revenue must be raised." It is not for us to show the way to raise it, that is the business of the gentlemen whom the country has entrusted with its Government.

But it is our business to show how not to raise it by an exorbitant, unjust, and impolitic Class-tax on British produce!

"HERMIT."

GENERAL ARTICLES.

THE FLORIDA VELVET BEAN.

Mr. D. W. May writes in the *American Agriculturist*:—

The velvet bean is supposed to be a native of India and was introduced into the U. S. as an ornamental plant, about 30 years ago. It is of rank growth and has been found useful in covering arbors, fences, and unsightly objects. It bears clusters of purple flowers and pods covered with a velvety down, whence the name. The pods contain from three to four beans of a mottled brown and white colour. In the U. S. this bean will mature seed only in Fla and the southern portion of the Gulf States. In this region it is considered equal to or superior to cowpeas.

In the south the velvet bean is planted in drills 4 feet apart and 2 feet apart in the row. From two to four beans are planted in each hill. Farther north, thicker planting may be followed. In the early growth of the plant it should be cultivated. In orchards it makes an excellent manure and mulch, but should not be allowed to climb the trees.

The velvet bean thrives best on light sandy soils. Being a nitrogen gatherer, it should be supplied with a liberal amount of potash and phosphoric acid. At the Ala sta velvet beans grown on poor soil fertilized at the rate of 240 lbs of acid phosphate and 48 lbs. of muriate of potash per acre yielded at the rate of 19,040 lbs. of green material per acre. The weight of the hay after five days, curing was 8,200 lbs.

At the same sta velvet beans were planted, Apr. 20, in rows 31/2 feet apart at the rate of 110 lbs. per acre, and were harvested Oct. 12, when they were too mature to make good hay. Analysis showed, that the crop contained 1887 lbs, and the roots and stubble 125 lbs. nitrogen per acre. The cured vines contained 229 per cent. of nitrogen and the air-dried roots 1 per cent. At the N. D. exper sta, where the plants grew 18 in. high and were in bloom when the first frost came, they contained 2·57 per cent. of nitrogen in the air-dry substance.

Experiments were made at the Ala exper sta to determine by the succeeding crop, the value of velvet beans as a green manure. The increase of a crop of sorghum after velvet beans over that of a crop from a plat on which no leguminous crop had been grown was 3,272 lbs. per acre. Sorghum, on a similar plat after cowpeas, gave an increase of 3,216 lbs. The average yield of oats after velvet beans was 33·6 bu per acre, in comparison with 31·6 bu after cowpeas, and 8·4 bu after crab grass and weeds and German millet. In plowing under a crop of velvet beans, it is advisable to use a rolling coulter on the plow, on account of the tangled mass of vines. As with other legumes, however, it is considered more economical to feed the vines and turn under the stubble. It was found further that the yield of velvet bean hay was about the same as the yield of cowpea hay. In Fla, where two or three cuttings are made in one season, the yield varies from two to four tons of hay per acre and the yield of seed from 20 to 28 bu per acre. The plant is recommended for green manuring in orange groves and for feeding to horses and cattle.

RULES FOR VALUING MANURES.

In *Manures and Manuring*, Mr. A. H. Pearson, Chemist to the Department of Agriculture, Victoria, writes :—

The essential constituents of manures are the nitrogen, the phosphoric acid, and the potash. The Artificial Manures Act of 1897 requires that vendors shall furnish with artificial manures, sold in any quantity above half a hundredweight, an invoice certificate showing the per cent. of nitrogen, phosphoric acid, or patash contained in the manure. The Act does not oblige the vendor to confine his certificate to a statement of these three ingredients; but it is advisable that he should do so, for anything else can only be regarded as so much padding, which tends to confuse the purchaser. All manures that have any value as plant-feeders contain one or more of these three important plant-foods nitrogen, phosphoric acid, and potash. It is these plant-foods that give value to the manures if the manures contain more of these plant-foods, they are more valuable; if they contain less, they are less valuable. Anything else that they contain, besides these plant-foods, is of little or no value and, has generally to be regarded as so much dead weight decreasing the value of the manures to the extent that they raise the cost of carriage.

The following is a sample of an advisable form of statement on an invoice certificate :—

Nitrogen (as sulphate of ammonia)	...	...	5 per cent.
Phosphoric acid—water soluble	...	...	4½ „
Do. citrate „	...	...	2 „
Do. insoluble ...	...	...	1 „
Total phosphoric acid		...	7½ per cent.
Potash (as potash chloride)		...	6 „

Such a statement contains all that is essential and nothing that is unessential; there is nothing in it to confuse the purchaser, and from it the purchaser can, if he knows the money value of 1 per cent. of each ingredient, readily and quickly find out the real value of 1 ton of the material.

For finding out the value per ton, the certificate is treated just the same as in invoice, except that, instead of dealing with pounds of materials at certain prices, one has to deal with percentages at certain values. Thus, if 1 per cent. of nitrogen in a ton of manure were worth 12s., 5 per cent. would be worth 60s. The value of 1 per cent. of an ingredient in a ton of manure is called the unit value. These unit values change according to changes in the manure market, but they remain fairly constant during one season.

INDIAN COFFEE.

The *London Commercial Record*, of the 11th ultimo, remarks :—

The curiosity and impatience with which those dealers in our coffee trade, who take a particular interest in fine colory East Indian descriptions, have been awaiting the first arrival of the new crop have at last been satisfied, for the first shipment of this season's Neilgherry has passed the hammer this week. Unfortunately the parcel in question was not a very desirable one, being of dullish colour and of middle size only, the disappointment, therefore, was great, as something better and something more tempting had been expected. Shippers, probably in their desire to obtain orders for their Indian friends' estates, had led us to believe that this year's crop would, in point of quality, show a great improvement over last season's yield, and, as this first arrival fell considerably short of the general anticipation, the disappointment found expression in slow bidding and low prices. No doubt the dull tone ruling in the terminal market was also responsible for the absence of competition, but we are inclined to believe that a desirable parcel would have met with a good demand, particularly being the first arrival, and would probably have realised more than 54s. 6d. for B size. Besides it would have tended to stimulate renewed interest in a coffee which for months past has suffered from a total absence of demand. There will be, we are afraid, no alternative left to East Indian planters, but to forward their coffee in consignment to London, trusting to stray orders on the part of Continental and Home trade dealers and consumers to realize reasonable prices. Looking at the position of the market now, we are almost inclined to believe that the sooner such ventures are undertaken the better for the planter. There is absolutely nothing at the moment which would justify the assumption that prices are depressed by a passing bear movement only, and that an early recovery would seem probable. Everything points to lower prices; Brazilian supplies keep on pouring in at an alarming rate, and holders of coffee having lost heart and being tired of hoping against hope for an improvement, are reducing their prices in the endeavour to reach a basis at which buyers will purchase at last. The value of East Indian will decline in sympathy with Brazilian and other important coffee descriptions, unless something unforeseen happens to save the position of coffee. It is a pity that our note of warning, sounded some time ago, has struck upon deaf ears only; heavy losses and much hardship would have been avoided.

RUBBER: ITS SOURCE AND USES.

Before the Pharmaceutical Society of Cape Colony at Cape Town, n December 13, Mr. G. T. Branch, formerly of the Metropolitan ollege of Pharmacy, London, read a paper on the above subject hich proved to be both interesting and instructive, and dealt ith the botanical sources of rubber in various parts of the world. e stated that many of the trees yield a rubber which, on drying, of too resinous or brittle a nature to be used by itself, and much it is used as an adulterant of the higher-grade product. Pará ubber, the most prominent kind, is most probably procured from he following plants:—*Hevea brasiliensis, H. guianensis, H. spruna, H. discolor, H. pauciflora, H. rigidifolia, H. lutea, H. membracea, H. nitida, H. benthamiana,* and *H. janeirensis.* The trees re some 50 feet in height Along the tributaries of the river mazon and in the vicinity of Pará are considered the best districts r *Hevea* species, where, notwithstanding the destructive method collecting, an area of 1,000,000 squares miles remains well opulated with trees. When a tree is twelve years of age it is conidered an adult, and a hundred of these have been known to roduce 1 ton of rubber. The rubber latex is found in the inner yer of the bark, close to the cambium, and is most abundant in he older tissues, spreading to the leaves and flowers. No good is erved by cutting into the wood; for not only is the tree stunted, nce its vitality is found in the xylem, but parasitic and fungoid rowths may ensure. The sp. gr. of the latex varies from 0·971 to ·017. It is generally alkaline to litmus with a faint but distinctly mmoniacal odour, but in a few cases is acid. Microscopically the tex shows a large number of caoutchouc granules in a milky edium, which, on careful agitation, will aggregate together. A umber of chemicals are in use to aid coagulation—alum in Brazil, lt on the Ivory Coast, dilute sulphuric acid in Maranbam, lemonice in Madagascar, and various vegetable infusions in Peru. The ifferent latices contain many various albumins and proteids of hich little is at present known. Mr. Branch described how rubber collected, and speaking of the various South African species remarked that little could be said about them commercially, although hey present most interesting features from a scientific point of iew. Of the West African rubber-producing trees generally, the ecturer had not much to say owing to the lack of time, but he asually mentioned that in Ceylon returns from 15 to 20 per cent. ould be obtained on the original outlay, after ten years, reckoning he price of rubber at 2*s.* per lb.

Questions were asked as to whether anyone could suggest a emedy for keeping rubber goods in a climate like that of South frica, and if perished articles were of any use for re-manufacturing -the first being the more important one as far as the African hemist is concerned. No answer of a satisfactory nature was forthoming.

INSECTS INJURIOUS TO FRUITS.

Prof. J. B. Smith, of New Jersey, writes in the *American Agriculturist*:—

Among the evidences of insect injuries is the turning brown and lying of the tops of peach trees. In some cases rot is blamable for his, but the injury usually results from a small green caterpillar, he larva of the peach twig borer. This insect, while a common ne in some sections of the country, is not very well known in N. J. t winters in the crotch of the tree or the limbs, as a caterpillar. ts presence is known by small balls of gum in winter, which exude rom little holes in the skin through which the larvae have bored, eeking winter quarters. This pest can be controlled by spraying vith paris green about the time the foliage starts in the spring. t seldom does any harm after July 1.

Nursery peach stock is frequently injured by a species of thrips. The damage occurs when the little trees are about 1 ft. high. The ip is attacked, the heart of the plant scraped off and the juices ucked out. The tree is stunted in many cases and is never worth nything. The pest begins his work as soon as the buds start. Seedlings seem to withstand the attack better than budded trees. The pest is the worst during hot weather. About the only way to ave the trees is to stimulate early growth by irrigation, and forcing by the use of quick acting fertilizers.

The San Jose pear borer seems to be gradually disappearing and, if properly looked after, there seems to be no cause for alarm. Scurfy scales are abundant and apple trees seem to be the most seriously affected. The apple plant louse can be effectually controlled by spraying with a weak insecticide just as the buds begin to open.

The effects of insecticides on foliage have been studied quite carefully. One rather peculiar fact is that young and tender foliage will stand stronger insecticides than older leaves. Paris green tends to choke the leaf or to close the breathing pores. Crude petroleum should never be used, for the paraffin that it contains fills up the pores. It has been frequently observed in orchards that no bad effects follow the application of paris green for some days and even weeks. Then suddenly the leaves appeared burned. This is explained by the fact that soon after application, the paris green becomes dry. While in this condition no injury occurs, but when moisture appears through humidity or rain, the soluble arsenic dissolves and the leaves are burned. As an insecticide paris green is by no means perfect. It is not uniform and is very costly. The green arsenod recently put on the market seems to be much more satisfactory. Soapsuds and weak kerosene emulsion are the very best applications for all kinds of plant lice.

On some varieties of pears the San Jose scale, which appeared very abundant in Spring, did not Show any increase by Autumn. This proves that under certain conditions the San Jose scale can be easily controlled or there are conditions under which it does not thrive. The best known as the Paris scale seemed to be abundant and is about as bad as the San Jose.

The yellow-necked caterpillar is quite abundant in many orchards, but this may be kept under by the use of arsenical poisons and in some cases by hand picking. The woolly apple louse is on the increase and will undoubtedly cause harm unless checked. The most serious injury from this pest is its work on the roots, forming galls, knots and the like.

The pea louse is abundant in many sections and the only practical method of controlling seems to be in raising early varieties. If the crop can be harvested by June 15, but little damage will result. Sweet peas are just as badly affected as garden or field crops. For small lots a strong decoction of tobacco will answer. Kerosene emulsion has been tried, but killed the vines.

BRAZILIAN NOTES.

(From the *Brazilian Review.*)

Exchange—*December 22nd*, 1900.—Ninety days rate on London opened on Monday 17 at 9 7/8d., fell to 9 5/8 on Wednesday, rose to 9 7/8d this afternoon but closed after hours at 9 25/32d.

There is little to add to what we wrote last week. The real factors of the situation seem for the moment so evenly balanced that neither bulls nor bears are able to make any permanent impression. To-day, for example, on the strength of Pará loans and other operations, rates were boosted to 9 7/8d. slumping again to 9 3/4 in the afternoon in consequence of a report of the reappearance of the "plague" at Santos. Any reason is sufficient to put rates up or down. The tendency is however upward, nor does it seem likely that, in the overbought state the market is supposed to be in, any new "bear" attempt would be successful. As regards the Pará loan we understand it is for £500,000 firm and £500,000 option. The business is said to have been closed in London and to be only waiting word for the Minister to receive instructions to sign the contract. The statement of the *Imprensa* that the loan has been negotiated through one of the Banks here is incorrect: no Bank had anything whatever to do with it. It is possible the business may be closed by the end of the year but exactly when or how it will be drawn cannot be said; anyhow it is highly improbable that the Pará Government will let the market into its secrets in this respect. . . . We are of the opinion that the factors are all in favour of steady rates for the next month, at least, with perhaps a rise to 10 1/2d. or more.

Beyond that it would be unwise to attempt to foresee as the whole future of coffee is so obscure and exchange rates so intimately related to coffee prices, that a slump in the latter might, with renewal of specie payments, be taken as the signal for a regular onslaught by the bears. Even if it were so we believe they would get the worst of it, as on the present footing it seems indisputable that the balance of trade and probably of money payments is in

our favour. Besides, it must be remembered that practically specie payments will be renewed from January when the 25% of duties payable in gold will be remitted, as it is with this gold that the interest of the debt will be paid in July next. If exchange does not fall in January or February, even if it do so in July or August, it will not be renewal of payments but some other cause to which it must be attributed. During the past week coffee sales were animated reaching 177,000 at Rio and Santos as against only 106,000 the previous week and 166,000 for the corresponding week last year.

Prices of coffee have again given way in foreign markets, the average Spot New York qualities for the past week being only 6·94c., but even so above that of the corresponding week last year, 6·81c.

The value of coffee cleared during the week amounted to £395,664 against £152,500 the previous week and £275,054 the corresponding week last year.

Coffee—*Santos, December 22nd*, 1900.—The downward tendency of the price of coffee was only checked during the latter half of the week under review, when it became apparent that the force of the bear movement in the consuming markets had spent itself, and prices became so attractive for consumers as to induce them to send large orders to buy of which only comparatively few could be filled at bottom rates of Wednesday, when some lots changed hands at about 5$600 for *superior*. The turn came very quickly and as there was some desire to cover and very little willingness on the part of the dealers to sell at the ruinous values below 6$000, prices rose to 5$800 and 5$900 and in some cases to 6$000: on Thursday this rise coincided with the fall of exchange to 9 5/8d.

Yesterday dealers were still less inclined to sell although 6$000 for *superior* was freely offered, and few lots only were for sale at about 6$100 to 6$200.

The position of our market is, no doubt, very peculiar and critical, for any inquiry of some importance would produce a sharp rise here.

It is said, and apparently not without reason, that all the weaker holders amongst dealers and Fazendeiros have got rid of their coffee and the 700,000 bags at which the first-hand holdings are estimated will not be offered for sale below 6$000.

The apprehensions uttered in consuming markets that a debacle might take place here and hundreds of thousands of bags be forced on the market in a day or two, or even in a week, are unfounded. The margin question, which is answerable for the collapses in the future markets of any produce, can never come into question here.

The demand was mostly for lower and medium grades of which more are coming forward now; yet fine grades are still difficult to be moved. There were large offerings of *Peaberries* and several big lots have been taken out of the market at low prices. Shipments have been somewhat lighter lately and are only just equal to arrivals, so that stock does not accumulate. Receipts continue large.

The estimate of the running crop by the Bureau of Agriculture appears rather early and, for this reason, one can hardly attach much importance to it. The total yield of the crop is estimated at 7,580,000 bags of which, deducting 172,500 bags for local consumption, 645,000 sent to Rio, and adding 300,000 coming from Minas, 7,062,000 bags remain for export in Santos.

Havre was the chief buyer during the week, paying from 30s. 6d. to 31s. 6d. for *superior* and 29s. 6d. to 30s. 6d. for *good average*. Hamburg and Rotterdam were less inclined to buy and the latter evidently stood under the influence of forced sales. The States are in the market only since Thursday and no business of importance has been done with those quarters.

The market here gained to-day further strength notwithstanding higher exchange and with very small offerings on the part of the dealers, 6$100 and 6$200 was paid for *superior*.

From S. Simáo in the State of S. Paulo a correspondent of the *Correio Paulistano* writes that "hail storms and gales have been frequent in this district during the present year and done much harm to the crops, whilst rains have been too frequent and made weeding difficult. Emigration continues and it is difficult to know what we are to do for labour in the season."

Coffee Census.—The Government of S. Paulo has at last determined to start a regular Coffee Census specifying not only the area and number of trees on each plantation, but their age and state of bearing. In this way the foundation will be laid for as precise crop estimates as such matters will permit, which will only have to be extended year by year and the state of the crops reported on monthly or quarterly, to furnish far more perfect elements for the trade than any yet known.

We have long advocated such an organisation and are happy to see the São Paulo Government at last taking it up in so thorough a manner. By keeping things back and deceiving consumers it is possible occasionally to gain a temporary advantage, but in the long run big crops, like murder, will out, and what is gained at the start is more than lost at the close. All that is wanted is that the statistics organised should be thorough and accurate, a true expression of facts whatever they may be.

Official estimates by the Agricultural commission of the current crop at S. Paulo give the probable total at 7,585,399 bags for 151 of the 153 Municipal districts into which the State is divided. In the 1st district the luxuriant flowering reported in the last bulletin did not set and at least half was lost in consequence, planters say, of the rains being followed by great heat. In spite of this, however, it is certain that the coming crop will be equal if not superior to this. In the 3rd district (Ribeirão Preto) the flowering was splendid promising a fine yield. At S. Rita and Passo Quatro the flowering was imprecedented, much being lost afterwards in consequence of drought. On 17th November a little hail fell but the state of the crop is decidedly encouraging. At Pirassununga the drought did some damage but only to cereals. At Sertaozinho the crop promises to be magnificent. In the 5th district the flowering was very good and prospects excellent. At S. Barbara do Rio Pardo & Sorocaba the prospects are good and also at S. Pedro. At Faxina there are 300,000 trees in flower. At S. Roque the trees are doing well.

A PLANTER'S SON.

The *Daily Mail* tells a wonderful narrative of a hermit millionaire whose father was a tea planter and smuggler. This seems exciting so we reproduce it. "Thirty years ago," says the *Mail*, "George Johnston, millionaire and laird of the Fife Isle estate, near Dundee vowed that no man should see his face again, and he kept his vow. But now he is dead. His father, Army officer, Indian tea planter and smuggler, gathered a huge fortune, and settled on the Fife Isle estate. He was hard and morose, strange in habit, and violent in temper. Yet he fell in love with Jean Douglas, the daughter of a peasant, and married her. She bore him a son and died. That was a bad day for George Johnston's father. He brooded, they say, over his loss; his temper became ungovernable. His son's was hardly better. One day the son tied the father in a carpet, threw him into a room, and decamped to the woods. The police caught him, and he was sent abroad. Thirty years ago the father died and the son returned to live a solitary, sordid life, without the touch of romance which redeemed his father's. Never once did he set foot across the threshold of the dilapidated manor house. A maid cooked his scanty meals, but never saw him. She would lay the food down, ring a bell, and withdraw. Only then would Johnston come out of his den. He had a craze for purchasing the tops of all the hills in the county. The Marquis of Bute proposed to construct a railway from Falkland Palace to the town of Falkland partly through Johnston's ground, but Johnston would have none of it. When he died a box of 40,000 sovereigns was found, and bank notes innumerable, stowed away in odd corners.

COFFEE IN THE UNITED STATES IN 1900.

The imports of coffee for the last trade and fiscal year ending June 30, 1900. were smaller than for the previous two years, says the *American Grocer*:—The United States Bureau of Statistics reports as follows:—

	Quantity. Pounds.	Value. Dollars
Imports	787,983,611	52,466,99
Exports	38,191,140	3.690,81
Net imports	749,792,471	48,776,17
Net imports, 1899	801,756,868	52,370,18
Net imports, 1898	851,691,084	62,674,18

The above table shows imports of 5,680,245 bags, as compared with 5,643,602 bags reported as arrivals by the New York Coffee Exchange.

The total deliveries for the year ending June 30, 1900. were 6.035.623 bags in the United States; 8,937,076 bags in Europe; total, 14,972,699 bags, against 13,480,904 bags in 1899; 14,571,90

bags in 1898. The deliveries for each month in the calendar year in the United States were follows :—

	Bags.
January	678,862
February	435,481
March	589,743
April	444,554
May	364,459
June	437,365
July	364,883
August	289,060
September	362,201
October	501,051
November	459,004
December (estimated)	548,165
Total	5,474,828

The visible supply of the world, January 1, 1900, was 7,036,093 bags; on January 1, 1901, it will be about 7,800,000 bags. The advance in coffee, which began in September, 1899, continued well into 1900. No. 7 Rio, which averaged 5·51 cents per pound in September, 1899, rose to 8·71 cents in February, 1900, reacted to 7·66 cents in May, and again advanced, until the high average of 9·39 cents was reached in July, since which time there has been a gradual falling off in price, until the average fell to 7·11 cents in December. This drop in prices has been due to an increased visible supply and a total production considerably ahead of average annual requirements of about 14,500,000 bags.

Sales of the New York Coffee Exchange about 7,500,000 bags.

The outlook is for cheap coffee throughout 1901.

The following table shows the average monthly and average annual spot cost of coffee :—

	No. 7 Rio. Cents.	Maracaibo. Cents.	Padang. Cents.
January	7·91	9·50@10 25	24·50 @25 25
February	8·71	10·00 ,, 11·00	23·50 ,, 25·00
March	8·27	10 00 ,, 11·00	23·50 ,, 25·00

DISTRICT ASSOCIATIONS.

INDIAN TEA ASSOCIATION, CALCUTTA.

The following is an Abstract of Proceedings of a Meeting of the General Committee held on 22nd ultimo. PRESENT :—Messrs. H. C. Begg (*Chairman*), W. Brown (*Vice-Chairman*), H. S. Ashton, G. A. Ormiston, A. Tocher, R. R. Toynbee, and T. Traill.

The Hon. Mr. J. Buckingham, C.I.E., Chairman of the Assam Branch of the Association, the Hon. Mr. R. H. Henderson, Chairman of the Cachar Branch, and Mr. A. J. G. Cresswell, Honorary Secretary, Cachar Branch, also attended by invitation. Proceedings of the meetings of the Committee held on the 8th and 11th January, having been approved in circulation, were confirmed.

Proceedings of the Assam Branch for December were to be recorded, after previous circulation.

The Hon. Mr. Buckingham, the Hon. Mr. Henderson, and Mr. Cresswell, were present in order to discuss with the Committee, the difficulties experienced by Tea planters in connection with the working of Act XIII. of 1859. The Hon. Mr. Buckingham explained briefly that many district officials, both in the Assam and Surma Valleys, do not approve of the manner in which the Act is at times used by Garden Managers. He, therefore, thought it was very desirable that some procedure should be decided upon, which Managers might follow, and which would be approved of by the Assam Administration. There had been rumours that the Chief Commissioner wished to amend the Act. So far as he (Mr. Buckingham) could ascertain, there was no intention to do so at present. But if planters did not agree upon uniformity in their procedure under the Act, there could be no reasonable doubt that it would be amended sooner or later, and most likely so amended as to make it much more disadvantageous to planters than at present. It was, therefore, he considered, of importance that a uniform mode of procedure should be decided upon and communicated to Garden Managers. There were three main points which should be insisted upon. They were :—

(*a*) There must be a written agreement for each individual labourer. That was of special importance, as the Assam Administration distinctly objected to verbal agreements. Moreover, the latter were not to the advantage of the Manager, as the witness was often absent when he was needed to prove the agreement.

(*b*) There must be a substantial advance. That was also of great importance. There had been advances of Re. 1; and it was true that, in accordance with the provisions of the Act, Magistrates were bound to take cognisance of cases brought under such contracts. But convictions could not, of course, be obtained.

(*c*) There must be a maximum limit to the period of the contracts. He (Mr. Buckingham) suggested that the period should be four years.

A full discussion of the points brought forward, and of the application of the Act generally followed. All present were agreed that a written agreement was desirable, and that there were no great difficulties in the way of its being given by planters. But upon the point as to what amount might be considered a substantial advance, the Committee were not able to offer an opinion. The advice of Messrs. Sanderson & Co. had been taken regarding it in 1899 (*see* Circular No. 717-O, of 20th November, 1899), when a case in which an advance of one rupee had been given was under consideration. No definite opinion as to the amount had, however, been received; and it was now agreed that the Hon. Mr. Buckingham and the Hon. Mr. Henderson should ascertain the views of Messrs. Sanderson & Co. with reference to it. Upon the third point—the limit of time—the Committee agreed with Mr. Buckingham that four years would be a suitable period. Another important difficulty was also mentioned by Mr. Buckingham. It had reference to the second section of the Act, wherein it is stated that if a workman or labourer has received money from the complainant (the employer) on account of work, and has neglected or refused to perform the same, "the Magistrate shall, *at the option of the complainant*," either order the defendant to repay the money advanced, or to finish the work. It seemed to Mr. Buckingham that according to the last opinion given by Messrs. Sanderson & Co. (*see* Circular No. 48, of 22nd August, 1900), it would be possible, under this section, for a labourer, after working for a period on a garden, to repay the advance made to him, and to terminate his contract. He was not sure if this were so, but he thought it was a point upon which legal advice was necessary.

The Hon. Mr. Henderson was inclined to think that such cases very rarely occured; but Mr. Cresswell gave several instances which had happened in Cachar.

It was agreed, after further discussion, that this point should also be referred to Messrs. Sanderson & Co. for further consideration and advice.

The Hon. Mr. Buckingham and the Hon. Mr. Henderson agreed to interview Messrs. Sanderson & Co., and to discuss the different points with them, and to report to the Committee.

Letters, dated 28th December, 1900, and 4th January, 1901, from the Secretary, Indian Tea Association, London, were brought up for final consideration and disposal, after previous circulation. The chief matters dealt with in these letters were :—

(*a*) **Increase of French Import duty on tea.**—In the letter, dated 28th December, Mr. Tye stated that he had been informed by the Secretary of the British Chamber of Commerce in Paris, that a decree of the French Government would shortly be published "postponing for a further period of six months (from the 1st January, 1901) the application of the maximum tariff, with a view to further action being taken."

(*b*) **Green teas.**—In the letter, dated 4th January, the London Committee asked what was being done in regard to the allotment of the proposed bounty on Green Teas. They also suggested that arrangements be made in good time so as to ensure the manufacture of a larger supply of green tea next season. The following extract from a circular, dated 4th January, published by Messrs. Wm. Jas. and Hy. Thompson, was also quoted in the letter, *viz.*:—"the best uncoloured teas sent there (the United States) from Ceylon, resembling the *namuna* tea made in India years ago, are finding favour: they are not green teas in the accepted sense."

The General Committee also had before them the following papers on the subject of green teas:—

(i) A letter, dated 18th January, from Messrs. Finlay, Muir & Co., covering a copy of a letter from Messrs. P. R. Buchanan & Co., London. This last named communication contained a suggestion that the Association should issue to the Managers of all gardens which are members of it, a full description of how best to make green teas; and should send suitable samples to be copied; and should also encourage the importation of several of Dean and Rae's steamers to such gardens as intend to make green tea in large quantities.

(ii) A letter, dated 14th January, from Mr. L. C. Baines (Messrs. Moran & Co.), offering to visit the principal tea centres in America and Canada, and to ascertain their requirements. He asked if, in the event of his offer being accepted, the Association would be prepared to meet part of the expenses of the journey.

The Committee, after a full discussion of the various points brought out in the above named papers, decided to take the following steps:—

(*a*) To telegraph to the London Committee, asking for two chests of the Ceylon tea referred to by Messrs. Wm. Jas. & Hy. Thompson to be sent out immediately.

(*b*) To ask the London Committee by the next mail, if there was any objection to the bounty being allotted upon the so-called *namuna* teas. It was believed that this description of tea, which is evidently similar to that referred to by Messrs. Wm. Jas. & Hy. Thompson, could be manufactured much more easily and successfully than any teas which could be accurately denominated as green teas. For the manufacture of the latter it appeared that special appliances were needed; while for *namuna* teas the existing machines would suffice. It was proposed, therefore, that a bounty of 1½ annas per pound should be offered next season on 250,000 lbs. of Green *or namuna* tea; the manufacturer to have the option of choosing which description of tea he would make. This proposal was made on the assumption that the statement made by Messrs. Wm. Jas. & Hy. Thompson was correct, *i.e.*, that *namuna* teas are in demand in the United States. The London Committee were to be asked to give their opinion upon this latter point.

(*c*) To inform Messrs. Finlay. Muir & Co. that the Committee did not feel in a position, at present, to issue instructions as to the proper method of making green tea, or to recommend any particular machine for use in the process. The other suggestion, that samples should be sent to Managers, was one upon which the Committee were arranging to act.

(*d*) To inform Mr. L. C. Baines that a sum of £50 would be granted to him in part payment of the expenses of his journey to America. He would be expected to make enquiries in the principal tea centres in the United States and Canada respecting the quality of the green teas required there; and also to obtain and send to Calcutta a few chests of the descriptions most in demand. It was also to be suggested to him that he should, if possible, go *viâ* Japan in order to obtain some information regarding the manufacture of Japanese green teas.

Considered a letter, dated 18th January, from Mr. H. H. Mann, B. Sc., asking the Committee to obtain the consent of Messrs. Williamson, Magor & Co. to a pruning experiment being conducted on their Majulighur Tea Estate, Bishnauth.

The Comittee directed that a letter making the request should be sent to Messrs. Williamson, Magor & Co.

Recorded a letter, No. 23-F, of the 13th January, from the Secretary, Calcutta Fire Insurance Agents' Association, in reply to the Committee's representation upon the Fire Insurance Tariff for Tea Garden Premises. The recommendations made by the General Committee were:—

(1) That subject to a provision in connection with the drawing of fires from boilers, the Fire Insurance Agents' Association be asked to abolish the additional rate of 2 annas per cent. charged "if the boiler and firing place are inside the building, or in a building communicating therewith, except by double firepr doors."

(2) That the Agents' Association be asked to reduce the ditional rate of 4 annas per cent. for fans to 2 annas per cent. the case of a building of brick and iron with hardwood floors, b with bamboo or cloth trays in its artificial withering chamb Further, that with non-inflammable racks consisting of wire n ting a nominal charge of ½ anna be suggested as being sufficie

(3) That a reduction of the rates for withering and fermen ing houses be asked for.

(4) That a reduction of the rate for carpenter's shops shou be asked for in those cases where it can be stipulated that neith fires nor artificial lights are used.

That some discount be allowed where the electric light is us in the factories.

The Committee of the Fire Insurance Agents' Association declin to entertain any of the foregoing proposals. Regarding (they stated that the Tea Tariff was favoured when the charge f this risk was fixed at two annas only. To abolish it would be direct opposition to the principle upon which all Tariffs were fo mulated. With reference to (2), the suggestion was opposed to th basis upon which additional rates are charged in all Tariffs. Re pecting (3) and (4), the experience of the different Companies connection with risks on buildings used for these purposes did n warrant a reduction; nor could any discount be allowed on accou of the electric light.

MEETING OF SOUTH MYSORE EUROPEAN PLANTERS.

At a Meeting of the European community held at Munzeraba Club, on 24th January, the following were present:—Messrs. G Anderson, C.I.E., J. G. Crawford (President of the South Myso Planters' Association), Whetherall (Sub-Divisional Officer), A. F Park, W. L. Crawford, J. Aird, W. Galiffe, Foulkes, Taylor, Lak Pittock, T. Anderson, Cant, Rutherford, Woods, Butcher, Robinso DeSalis.

Mr. J. G. Crawford proposed that Mr. G. Anderson should tak the chair.

Seconded by Mr. J. Aird and carried unanimously.

All present having risen, the Chairman addressed the followin words:—

GENTLEMEN,

The mournful event which has so suddenly called us together is national bereavement and an universal sorrow which will be deepl deplored throughout the whole civilized world—Her Most Graciou Majesty the Queen-Empress has passed away.

The world's ideal of a Christian Queen, Woman and Mother, ful of tenderness, sympathy and solicitude for all around her and wh has always bestowed on her family and subjects alike, the untirin help of her consolation, benevolence and encouragement, is no more

Blessed with every attribute which could possibly add to the grace ful charms of a loving disposition, she has given to her subjects noble example, both in her own home and while discharging th exalted obligations of the sacred trust confided to her care.

We, and our parents, have had ample opportunities for watchin and appreciating the numerous manifestations of her motherly love her womanly tenderness, and her queenly condescension, and th great spontaneous outburst of universal thanksgiving during th Jubilee celebrations for the blessings of security, justice and freedom which have been maintained throughout the Empire during he glorious and unexampled reign was the clearest possible proof tha she was enshrined in the loving hearts of hundreds of millions o people in all parts of the world. History abounds in characteristi incidents of her beneficent intentions and her Christian trustfulnes and resignation.

In health or in sickness, in affluence or in poverty, in prosperity o in misfortune, in happiness or in sorrow, our beloved Queen-Empres has always been the first to send inquiries, felicitations or condolence

She has lived for her people and her people have blessed her.

Her charity was unbounded and her benign influence was so diffused as to reach and permeate the hearts and homes of even th humblest of her subjects and was the means of strengthening thos

es of affection, gratitude and admiration which have bound hundreds f millions of loving hearts to her throne and sacred person during uch a long and glorious reign in which with transcendent wisdom and enevolence she has ruled

"With those mild arms of truth and love
Made mighty by the living God."

Although we are only a small community, let us join in the univer-l mourning and make arrangements for giving heartfelt expression o our profound sorrow by tendering our most humble condolence hrough His Excellency the Viceroy and to Her Highness the Maharanee Regent of Mysore who, we well know, are overwhelmed ith grief.

Mr. J. G. Crawford proposed that the Chairman and Mr. J. Aird dopt measures for conveying to His Excellency the Viceroy a heartfelt xpression of profound sorrow on behalf of the European community f South Mulnad of Mysore at the sad intelligence which has been eceived of the death of Her Most Gracious Majesty the Queen-Empress, together with their most loyal and humble condolence with he members of the Royal Family and also with Her Highness the Maharanee Regent of Mysore.

The following telegrams were despatched from the room :—

To

HIS EXCELLENCY THE VICEROY OF INDIA,
Calcutta.

The lamented death of Her Most Gracious Majesty the Queen-Empress has caused the most profound sorrow to the members of the European community of South Mysore Mulnad, who, at a Meeting eld to-day, have directed me to convey to Your Excellency a heart-elt expression of their grief and their sincere and humble condolence ith all the members of the Royal Family.

To

HER HIGHNESS THE MAHARANEE REGENT OF MYSORE,
Madras.

Your Highness' European subjects in the Southern Mulnad desire o tender a sincere expression of their profound sorrow at the death f Her Most Gracious Majesty the Queen-Empress and condolence ith Your Highness and members of the Royal Family.

The Meeting then closed with the usual formalities.

SHEVAROY.

Proceedings of a Meeting of the Committee of the Shevaroy Planters' Association held in the Victoria Rooms, at 1 P.M., on Monday, the 4th February, 1901. PRESENT :—Messrs. J. C. Large, C. Rahm, W. J. Lechler, Rev. M. Anderson, and Mr. R. Gompertz, *Honorary Secretary.*

Read correspondence with the Traffic Manager of the Madras Railway regarding the rates to be charged for conveyance of parcels from Suramangalam to the Hills.

Resolved that the Honorary Secretary do write to the Traffic Manager saying that if the contractor will accept the rates offered by the planters for parcels delivered within the Yercaud Union, the planters would be willing to accept the rates fixed by the Traffic Manager for parcels delivered outside those limits.

Read correspondence between Honorary Secretary and Mr. S. M. Hight regarding a coffee-stealing case which occurred on the Scotforth Estate.

Resolved that this meeting approves of the course adopted by the Honorary Secretary.

Read circular No. 5/01 from the Secretary, U. P. A. S. I., inquiring at which port the Association wants a Harbour.

Resolved that this Association would prefer Calicut or Beypoor.

The following papers were read and recorded :—

No. 3/01. Circular from Secretary, U. P. A. S. I., regarding "*The French Import Duty.*"

No. 83/00. Circular from Secretary, S. P. A. S. I., forwarding letter from Honorary Secretary, Wynaad, who wishes Ceylon duty on tea removed.

No. 6/01. Circular from Secretary, U. P. A. S. I., Planters' Associations replying to Chairman's circular regarding *Differential Duties.*

No. 7/01. Circular from Secretary, U. P. A. S. I., regarding the position of the Tea industry.

No. 8/01. Circular from Secretary, U. P. A. S. I., regarding "*The Proposed Tea Cess.*"

2/H. Letter from Mr. Hardy *re* the conveyance of parcels from Salem to Yercaud.

6/C. Letter from Collector of Salem who wishes the opinion of Honorary Secretary as to whether planters are likely to undertake mule breeding.

The following papers were laid on the table :—

Brazilian Review, dated November 27th and December 4th, 11th, and 18th of 1900.

Planting Opinion, dated January 12th, 19th, and 26th of 1901.

Proceedings of the Indian Tea Association, dated December 5th, 1900 and January 8th, 9th, and 17th of 1901.

Proceedings of the Central Travancore Planters' Association, dated January 12th of 1901.

Proceedings of the Wynaad Planters' Association, dated January 2nd of 1901.

Bulletin No. 8 of Agricultural Series (procedure to be adopted in the Systematic Examination of varieties of crops).

Bulletin No. 7 (note on Sugarcane diseases).

Bulletin No 9 (experiments on the growth of wheat and maize at the Cawnpore Experimental Farm).

Bulletin No. 10 (experiments at the Cawnpore farm on the growth of wheat (*a*) with green manuring and (*b*) in rotation with leguminous crops).

Bulletin No. 11 (a note on trials of an Aermoter in Well irrigation).

Bulletin No. 42, Vol. II. (native beliefs regarding the hair-marks on horses and cattle).

YERCAUD,
5th Feby., 1901.

ROBT. GOMPERTZ,
Honorary Secretary, S. P. A.

MARKET REPORT.

[*Per Mail advices of 18th January*, 1901.]

COFFEE.

The London Commercial Record says :—A dull tone has prevailed in this market, and with the exception of a few lots of good colory qualities, prices generally have been in favor of buyers. Further supplies to a moderate extent of new crop Neilgherry and Wynaad have been brought to sale, but the quality is disappointing and the assortment by no means favorable; the greater part remained unsold, and the few transactions which have taken place have been at comparatively low prices. Nyasaland is rather easier. With few exceptions Central American descriptions generally shew a further decline. The market for "futures" has been irregular, but the closing rates shew no material change for the week; latest sales include May Santos at 32s 6d, September at 33s, and December at 33s 6d to 33s 4½d

Auction supplies to-day comprised 10 casks 5 tierces 6 barrels Plantation Ceylon, 183 bags East India, 672 bags Nyasaland, 100 bales Mocha, 155 barrels 124 bags Jamaica, 820 bags Vera Paz, 466 bags Costa Rica, 1,512 bags Guatemala, 251 bags Salvador, 60 bags Columbian, 51 bags Peruvian, 48 bags Nicaragua, 570 bags Ecuador, and 3,887 bags Santos. The auctions went off quietly at about steady prices for good qualities, but the commoner grades were lower.

London ...	Santos ...	March delivery ...	32s 3d.
New York ...	No. 7 Rio...	„ ...	5 80 cents.
Hamburg...	Santos ...	„ ...	32¼ pf.
Havre ...	Santos ...	„ ...	39¼ francs.

Imports, Deliveries and Stock of Coffee in London, are as follows :—

	STOCK.		IMPORTS.	
	1901.	1900.	1901.	1900.
Tons ..	14,788	14,474	908	1,154
	HOME CONSUMPTION.		EXPORT.	
	1901.	1900.	1901.	1900.
Tons ...	742	700	365	734

The preceding figures exhibit—	Tons.
the Imports a decrease this year of	246
Home Consumption an increase of	42
Export a decrease of	369
Stock an increase of	314

Auctions this week have passed off as follows:—

Ceylon—*Plantation.*—12 packages partly sold—smalls 42s 6d to 50s, pea-berry 46s 6d.

East India.—1,821 bags 92 cases partly sold, as follows—*Neilgherry*, smalls 41s 6d to 49s 6d, low middling to middling 45s to 53s 6d, pea-berry 65s; *Wynaad*, bold dull greenish 54s to 54s 6d; *Coorg* (old crop), smalls 40s to 44s, low middling to middling 50s 6d to 52s, bold 61s to 62s, pea-berry 48s to 64s.

Nyasaland.—31 bags sold—picking 32s to 33s.

Costa Rica.—1,776 bags mostly sold—smalls 33s to 43s, low middling greenish to colory 48s to 52s 6d, middling to good middling colory 54s to 62s 6d, bold 62s 6d to 70s, good ditto 78s 6d to 84s 6d, pea-berry 52s to 76s.

Guatemala.—Of 1,798 bags offered 430 bags sold—small 41s 6d to 43s, low middling to good middling 48s to 53s, bold 66s to 69s, pea-berry 58s to 67s.

Salvador.—Of 137 bags offered 30 bags sold, low middling 44s.

Nicaragua.—46 bags sold, country-damaged 36s 6d to 38s 6d.

Colombian.—Of 1,511 bags catalogued 1,170 bags sold, smalls 34s 6d to 36s 6d, low middling to middling 42s 6d to 51s, bold 49s to 53s 6d, extra bold 64s 6d to 65s, pea-berry 48s 6d to 54s 6d.

Venezuelan.—16 bags partly sold, smalls 41s, pea-berry 56s.

Mexican.—716 bags partly sold, good ordinary brownish 37s 6d to 38s, low middling to middling 42s to 47s, pea berry 48s

Brazil.—52 bags Santos, quay terms, partly sold, without reserve, at 30s 6d.

43 barrels Jamaica, 108 half-frazils Mocha, 62 bags Singapore Liberian, and 486 bags Ecuador were bought in.

TEA.

China.—At auction during the week 5,445 packages were offered and partly sold with difficulty at unchanged rates, except for Green Teas which were well competed for at a slight advance. Souchong 3d to 5½d, new make 4½d to 6⅝d, Kaisow 3½d, Lapseng Souchong 5½d, Scented Orange Pekoe 10d, Scented Caper 4d to 6¾d, siftings 3d to 5½d. Moyune Green:—Gunpowder 9¼d to 1s 1d, Impe 3½d to 7d, Foong Mee 10¼d to 1s ½d. Sow Mee 8d, Young Hy 3⅝d to 8½d, Hyson 3¼d to 4d per lb.

Indian.—A slightly larger quantity was put forward, *viz*:—52, packages contrasted with 51,000 packages last week, and 60, packages in the year before.

There was a steadier tone and more general buying, though pri for common grades seldom shewed any recovery. Fair to g kinds with useful cup met with better competition and the m desirable brought firmer rates. Over 8d per lb. there was an proved enquiry, especially for Broken Pekoes with strong liq which in many instances marked an advance, and higher figu were recorded for finest lots.

For 48,800 packages on Estate Account 6⅞d per lb. was obtai versus 8¼d per lb. for 47,000 packages, and 9¼d per lb. for 42, packages in the two preceding seasons.

Ceylon.—Public sales comprised 29,400 packages, compared wi 28,500 packages on the 8th instant and 30,000 packages at this ti twelve months since.

Pekoe Souchongs and Pekoes under 5½d per lb. were again plen ful, but were taken up freely without change in quotations. Owi to the Russian holidays shipping orders were scarce, the Ho trade, however, gave support to both Pekoes and Orange Pek with full flavour, which on the whole went well. Broken Pek ruled somewhat irregularly and occasionally dearer. Choice tip parcels were very sparsely represented.

In consequence of the preponderance of inferior consignmen the weekly average has declined to fractionally over 6½d per (which point it touched on the 19th June, 1900), opposed to 6 per lb. on the 10th instant and 7¾d per lb. on the 18th January year ago.

Java.—Rather over 2,000 packages of direct import passed t hammer, prior values being maintained in the majority of cas For the 24th instant 1,900 packages are advertised.

Deliveries.—The clearances of all Tea (on which duty has be paid) from the London warehouses, as per official returns a *viz.*:—

From 1st to 15th January,	1901	...	10,284,607 lbs.
Do. do.	1900	...	*15,838,156 ,,

During the week the following have been printed for sale b public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offere Pkgs.
India ...	47,679	5,209	52,888
Ceylon ...	26,983	2,388	29,371
Java ...	1,164	880	2,044
Total ...	75,826	8,477	84,303

Also 565 packages from second hands.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon and Java Tea Report, dated January 18th, 1901, says:—

Quantity brought to Auction in London from 1st June to date

	Indian. Pkgs.	Ceylon. Pkgs.	Jav Pkg
1900-1901	1,037,806	789,077	34,6
1899-1900	1,118,283	765,981	37,1

54,639 *pkgs.* Indian
30,314 ,, Ceylon
2.044 ,, Java
} Total 86,977 packages were offered in public auctio this week.

In view of the serious over-production of Indian and Ceylon Te Proprietors of Estates are trying to arrange some plan by whi the output may be reduced. Committee meetings of the Indi and Ceylon Tea Associations have already been held with th object in view.

Customs figures showing the movements of Tea from 1st Ju to 31st December are given below, the figures extending over t first 8 months of the season. The re-exports of Indian and Ceyl Teas, especially to countries in Europe and "other countries," a encouraging, and indicate that the low prices are having conside able effect in stimulating foreign demand.

Indian.—The quantity brought forward was slightly above th of last week, but the market showed more animation than has be the case for some time past, buyers operating with more confidenc the result being that prices for all grades continued steady, wi

* This embraced one large payment in advance.

here and there a tendency towards higher quotations among useful liquoring Teas. The Official Wire gives exports to U. K. for the first half of January as 6,210,000 lbs., against 5,2 0,000 lbs. for same period last year, making total exported to U. K. from 1st April, 1900, to the middle of January 150,900,000 lbs., against 141,192,000 lbs. last season.

Week's average of Tea sold on Garden Account 1901, 49,012 pkgs., av. 6·86d. 1900, 48,112 pkgs., av. 8·15d.

Total Tea sold on Garden Account 1st June 1900 to date, 852,303 pkgs., av. 7·51d. 1900, 856,130 pkgs., av. 8·45d.

CEYLON.—Although the auction was comparatively heavy, comprising 30,314 packages against 28,201 last week, bidding was somewhat more animated, and prices generally were steady, with a slight tendency here and there towards better rates for useful descriptions. Private advices from Ceylon give shipments to U.K. for first half of January as 6,500,000 lbs., against 3,500,000 lbs. last year, and estimate the quantity for the month as 10,000,000 lbs., against 10,500,000 lbs. in January last year. Average for week 6·15d., against 7·71d in 1900.

Ceylon Tea sold on Garden Account 1st January to date, 67,727 pkgs., av. 6·68d. 1900, 77,756 pkgs., av. 7·80d.

JAVA.—A fair quantity was brought forward and met with rather better competition, although some parcels were withdrawn for higher limits. 11,973 packages are advertised to be sold in Amsterdam on the 24th instant.

Bank Rate 5 per cent. Exchange on London three months sight:—Calcutta 1/4⅜. Colombo 1/4 13/32.

COCOA.

Auctions on Tuesday embraced 3,721 bags, which met a quiet demand, but 2,680 bags were placed, at somewhat irregular prices. Trinidad decline 1s to 2s per cwt., whilst other growths were a little easier, except Ceylon which appreciated somewhat. Of 1,883 bags Trinidad catalogued 1,700 bags sold at 70s to 73s for fine and very fine red, and 67s to 69s 6d for middling. 155 bags Grenada mostly sold at 68s 6d for fine. 81 bags Dominica realised 64s to 66s 6d for common to fair. 60 bags Jamaica about half-sold at 66s 6d to 67s for good fermented. 62 bags St. Lucia found buyers at 65s to 67s 6d for dark to good. 25 bags Surinam partly sold at 67s 6d. Of 989 bags Ceylon brought forward 670 bags were placed at 94s to 101s 6d for fine bold, 85s to 92s for good medium and bold, and 63s 6d to 67s 6d per cwt. for smalls, broken 70s. Privately nothing of interest passing.

PEPPER.

BLACK.—The market is quiet, and value for arrival is about 1/16d per lb. lower. About 150 tons Singapore have been sold at 6½d down to 6 7/16d March-May shipment. On the spot sales have been made at 6 5/16d down to 6¼d for fair Singapore.

At public sale on the 16th instant 98 bags good brown Tellicherry realised 6¼d, and 36 bags Ceylon 6⅛d to 6¼d per lb, for fair to good clean heavy brown. 200 bags Aleppy and 134 bags Trang bought in at 6⅛d, also 25 bags damaged Singapore. To-day quiet.

The shipments of Black Pepper for the first half of January compare as follows:—

	1901.		1900.	
U. K.—Singapore ...	50	50	*nil*	130
„ Penang	*nil*		130	
Continent		110		50
U. S.		700		110
Total tons ...		860		290

WHITE.—Is also very quiet. About 50 tons have been sold, *viz.*, Singapore on the spot at 9 9/16d, and at 9½d down to 9⅜d for February-April shipment. Sales of fair Penang on the spot at 8 9/16d, and a little lot February-April shipment at 8 11/16d.

At auction on Wednesday 267 bags Singapore and 189 bags Penang retired unsold.

The shipments of White Pepper for the first half of January compare as follows:—

	1901.		1900.	
U. K.—Singapore	30	30	40	160
„ Penang	*nil*		120	
Continent		20		30
U.S.		120		—
Total tons ...		170		190

LONG.—52 bags withdrawn.

GINGER.

COCHIN.—206 bags were brought forward, and 132 bags sold "without reserve" at 29s 6d to 30s for bright small and medium washed rough very wormy, and 29s per cwt. for common washed partly shrivelled, being rather below valuations.

CAPSICUMS.—10 bags fine Aden bought in at 65s per cwt.

CLOVES—*Zanzibar.*—There is very little life in the spot trade but values are maintained, the few sales reported being at 4¼d to 4⅜d for dullish to fair. For forward delivery, however, the market has further improved, although the week's business is not extensive, probably not more than 3,000 bales; January-March sold at 4 13/32d to 4 7/16d, March-May at 4⅜d to 4 7/16d (closing sellers at the latter), and June-August at 4⅜d per lb. and buyers.

20 bales, offered at auction on Wednesday, sold at 4⅜d for fair and 4¼d for barely fair.

PENANG.—15 cases mostly sold—dark unpicked 4½d to 4¾d per lb.

CARDAMOMS.

There was a poor demand in auction, and in most instances lower prices were accepted. The following prices ruled:—Ceylon-Mysores, fine bold pale (well bleached), 3s 8d; medium to bold pale, 2s 8d to 3s 1d; medium brownish, 2s 2d to 2s 5d; medium long lean, 1s 10d to 1s 11d; small pale, 1s 5d to 1s 9d; brown and split, 1s 2d to 1s 4d; very small pale, 1s 2d; wild native longs, 1s 9d to 2s 9d; seeds, 1s 8d to 2s 4d. No Ceylon-Malabar sold.

CINCHONA.

At the monthly public sales of bark, on Tuesday—the first of the year—presented 1,740 packages, the bulk of which sold with good competition, at full to rather higher prices. The unit value was about 1½d, against 1⅝d at the last public sale in Amsterdam and 1⅝d at the corresponding time last year.

550 bales *South American* sold—yellow quill 5¾d to 9d, broken quill 7d to 8¼d, flat 11⅞d per lb.

285 packages *Ceylon Cinchona* offered and 100 packages were placed, as follows:—Succirubra, chips and shavings 3⅛d to 4d, ditto renewed 5⅞d, root 3⅝d; Hybrid, chips 6⅛d; Ledgeriana, chips 7⅞d per lb.

Of 649 bales *East India Cinchona* catalogued, about 550 bales sold, *viz.*:—Officinalis shavings 4⅜d to 7¼d chips 3¼d to 6¾d, chips and shavings renewed 5d to 9½d. stem and root 6½d to 8d, branch 2½d to 3d; Ledgeriana, chips 1s, branch 8d, root 2¾d per lb.

Of 256 bales *Java Cinchona* 80 bales sold—Succirubra, root 4d; Ledgeriana, branch, 3d to 6d, root 3¾d; Hybrid, chips 8d to 8¾d per lb.

The shipments of Java for the first half of January were 610,000 Amsterdam lbs., contrasted with 216,000 Amsterdam lbs. in the corresponding period last year.

The *Chemist & Druggist* says:—There was a steady demand for the small supply offered in auction on Tuesday, and the greater proportion sold at an average unit of 1⅜d to 1 7/16d, or about equal to the last London sale, and 5 per cent. advance on the Dutch auctions last week. The shipments from Java for the first half of the month were 609,000 Amst. lbs., against 216,000 Amst. lbs. last year.

The following table shows the quantities offered and sold:—

	Packages offered.	Packages sold.
East Indian cinchona	549	437
South American cinchona	550	550
Ceylon cinchona	256	63
Java cinchona	285	100
	1,640	1,150

The following were the approximate quantities of bark purchased by the principal buyers:—

	Lbs.
Messrs. Howards & Sons	83,414
American and Italian factories	43,534
Frankfort-on-Main and Stuttgart factories ...	22,580
Imperial Quinine factory	21,078
Brunswick factory	16,266
Mannheim and Amsterdam factories	11,144
Paris factory	890
Druggists, etc.	28,676
Total quantity sold	227,582
Bought in or withdrawn	84,296
Total quantity offered	311,878

The prices paid for sound bark were as follows:—

JAVA.—Ledgeriana, original stem, 5⅛d to 8¾d; branch, 3d to 6d; root, 3¾d. Original red stem, 4¼d, and branch, 5⅜d per lb.

CEYLON.—Crown, chips and shavings, 6⅛d; broken quill and chips, 3⅛d. Red chips and shavings, 3¾d to 5⅞d. Ledgeriana chips, 3⅞d; and chips and shavings, 2d.

SOUTH AMERICAN.—Bolivian cultivated Calisaya, fair to good quill, 5¾d to 7⅝d; broken quill, 7d to 8¼d; fair flat cultivated Calisaya, 11⅞d per lb.

EAST INDIAN.—Crown, chips, 7⅛d; chips and shavings, 3¼d to 7⅞d; broken quill and chips, 4¼d to 5½d; chips renewed, 3d to 9½d; stem and chips, 3¾d to 3⅞d. Ledgeriana, chips, 8d to 1s; chips and shavings, 1¾d; stem and chips, 2¾d per lb.

QUININE.

A reduction of 1½d per oz. in the official quotation was announced on January 12, makers of German sulphate now quoting 1s 1d per oz. for 1,000-oz. lots in tins of 100 oz. Messrs. Howards & Sons now quote 1s 3d in bulk and 1s 5d in vials, either prices for no less than 1,000 oz. Whiffen's prices have also been reduced to 1s 2d for either bleached or unbleached. Salts of quinine have also followed the reduction. The decline of 10 per cent. in the unit at the Amsterdam bark-sale is responsible for the alteration in prices. The second-hand marked became easier on the news of the official reduction, the week opening with sellers at 1s 0½d spot and buyers at 1s, a small business being done at 1s 0½d for May. The result of the London bark-sale on Tuesday, however, gave a firmer tone to the market, although little business has been done, 1s 0¼d having been paid for spot and March delivery. There are said to be large orders on this market for U.S. account, which may have the effect of driving prices up.

PLANTING OPINION.

A WEEKLY JOURNAL.

WRITTEN BY PLANTERS FOR PLANTERS.

VOL. VI.] MADRAS, SATURDAY, FEBRUARY 16, 1901. [No. 7.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 22nd instant. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

POLLI BETTA, 12*th February*, 1901.

Coorg. —*Weather.*—Continues cloudy and warm. There was rain out East last Saturday. *Crop*—Hot weather conditions having now supervened, it is felt that it is useless allowing the berries any longer on the trees to ripen, and stripping is being carried out as quickly as possible. Labour is sufficient. *General Health.*—Small-pox is very prevalent: jungle tribes are taking kindly to being vaccinated. Paddy crops, which is a bumper one this season, has been harvested.

ECONOMIC ENTOMOLOGY IN QUEENSLAND.

IT is wearisome work recounting what is being done elsewhere, while so little is being attempted in the Madras Presidency. In the United States, there is an admirably organized, strongly manned, Department of Agriculture. In Queensland, there are Instructors of Fruit Culture, Coffee Culture and Tobacco Culture: there is also an Entomologist. Madras can show us nothing but a nominal Agricultural Department, the leading spirit in which is Professor of nothing but the Art of Writing Reports to prove that Inaction is Progress. It is with feelings near akin to envy that we scan the official report for the year ending 30th June 1900 of the Entomologist to the Government of Queensland. The report tells us of various insect-foes reported upon, mostly those that prey on fruit and vegetables, cereals, sugarcane, and ornamental plants. Of insects that prey upon Coffee never a word; so that we might almost assume that Coffee in Queensland is free from insect-foes? Under the head of Vegetable Pathology we read of the following among the principal constitutional plant derangements arising from uncongenial soil or atmospheric conditions:—"*Coffee.*—Leaf Blight, caused by Cladosporium sp., Russell River; physiological (?) disease, Cairns; physiological (?) disease, Tinana; Leaf Blight, caused by Cerospora sp., Mackay; Leaf Incrustation, caused by lichen (*Strigula sp.*), Cairns; Fungus Disease (?) caused by Pellicularia sp., Russell River." Special reference is made to the working of the Diseases in Plants Act, 1896. This, it is stated, has involved the preparation of some eighty-five separate reports, many of them dealing with more than one subject. These reports have related to the following amongst other topics:—Procedures involved in carrying out the Act; the condition of fruit or plants so far as related to existence of disease in connection therewith: the nature of disease observed; the degree of vitality or virulence that it manifested; and the effect due to the action of disinfecting processes upon plants or fruit; or upon the diseases or insect-pests occurring in or upon them.

We also note that six lectures on entomology were delivered at the Agricultural College to a class averaging fifteen students, "all of whom bestowed marked attention on the instruction thus afforded." Various investigations in the field were carried out. Numerous collections were made, and in this connection it is especially interesting to note the Entomologist's remark that the work of the year has served to emphasise the necessity for a special effort being made to largely increase the comprehensiveness of the various divisions that the collection comprises. He suggests that a small sum of money might be with great benefit devoted to the fulfilment of this need, for the Entomologist, owing to the urgent requirements of other duties, can give little or no time to accumulating and preparing for permanent preservation and display insects specimens as well as illustrations of their depredations and of their serviceable work. He rightly observes that specimens of every insect that is directly injurious or beneficial in each of the stages of its metamorphosis and of objects serving to throw light on its life history should find a place in the cabinets, and that exponents of the insects fauna generally of each of the major divisions of the colony should be secured in order that cognizance may be taken of the extent to which the interests of the residents in such of them are or may be affected by the different members of this section of animal life and of the kinds of insects that are respectively concerned. The information of a class that so comprehensive a collection may be calculated

to afford is frequently in demand. In Madras, planters alone appear to have arrived at the stage of realising how necessary entomological research and study is. The Government remains unconvinced, or at least inactive. The scientific side of agriculture in this Presidency is almost entirely neglected. This, too, at a time when coffee-planting on the Lower Pulneys has been practically destroyed by insect-pests, and when other coffee districts have felt the effects of such pests more or less severely.

In appointing an Entomologist the Government of India has taken a step in the right direction, but a step so absurdly short as to make the Government itself appear ridiculous. Imagine a man who feels that he must jump across a deep chasm, 15 feet or so in breadth, putting one foot forward an inch or two across the verge, as if to estimate the depth of the chasm, in view of failure to reach the other side! This is a simile that fairly reflects the Government's action. The good that may eventually result from the work of one entomological scientist in the vast continent of India is so remote that it need no more be taken into account than would such a movement as we have referred to on the part of a chasm-leaper. It is not in regard to coffee alone, or tea and coffee and cinchona and pepper and vanilla, and cocoa and other products in which European planters are interested, that India needs entomological and scientific investigation. Sugar-cane, wheat, oil-seeds, cotton, jute and various other products all call for similar inquiry, for every plant has one foe at least, and the development of the agriculture of the country depends largely upon the suppression of these foes. To set one man against them is to provoke ridicule. Even a large staff such as is attached to the Agricultural Department of the United States would find work enough to do to cope with these plant-Boers, fighters in armies at times, guerilla warriors on occasion, foes to be met successfully only by a war of extermination conducted on the most advanced principles. The Government of India is in the position of Commander-in-Chief; the Governors of Presidencies and Lieut. Governors of Provinces are Divisional Commanders. Upon them eventually will depend the issue, Victory or Defeat.

PLANTERS' ASSOCIATION OF CEYLON.

It is notified that the Annual General Meeting will be held within the "Ferguson Hall," Victoria Commemoration Buildings, Kandy, to-day, commencing at 3 P.M. The following is the Agenda paper :—

To receive the Annual Report.

To elect a Chairman, Secretary, and Committee for the ensuing year.

Resolution to be proposed by W. D. Gibbon, Esq. :—"That Mr. Edward Rosling, be elected Chairman for the ensuing year."

Resolution to be proposed by the Hon'ble Mr. J. N. Campbell :—"That Mr. Alexander Philip be elected Secretary of the Planters' Association of Ceylon for the ensuing year."

To receive the Report of the "Thirty Committee."

To appoint 24 Members of the Planters' Association of Ceylon to serve on the "Thirty Committee" for 1901.

To appoint a Committee to manage the affairs of the Labour Federation of Ceylon for the year 1901.

To appoint a Cacao Committee of the Planters' Association of Ceylon.

To receive Abstract of Accounts of the Planters' Benevolent Fund for the year 1900.

Resolution to be proposed by Edward Rosling, Esq. :—"That action be taken by this Association with a view to forming a combination amongst Indian and Ceylon Planters, to cope with present unsatisfactory condition of the Tea market, consequent over-production."

Resolution to be proposed by Edgar Turner, Esq. :—"That the opinion of this Association the time has arrived to approa the Government of Ceylon asking for (1) the abolition of the Imp duty on Tea in Ceylon, (2) the appointment of Inspectors to gu against the export and import of rubbishy Teas."

Resolution to be proposed by Hon'ble J. N. Campbell :—"Th Government having been unable to comply with the request fo reduction of Railway Rates the appointment of a Commission the incidence of taxation be asked for."

Resolution to be proposed by James Westland, Esq. :—"Th Government be asked to contribute from Surplus Revenue to t Tea Cess Fund a similar sum to the amount collected."

And for such other business of which due notice is given.

U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I

Alleged Adulteration of Indian and Ceylon Teas.

The Indian Tea Association has issued the following circul to all members of the Association :—

DEAR SIRS,—I am directed by the General Committee to subm for your information, the subjoined copies of papers relating certain allegations which have been made in India, and repeated England, to the effect that adulterated tea sweepings are sold as t by Indian and Ceylon Planters.

2. The General Committee are of opinion, as you will notice fro their letter, that these statements are not in accordance with t facts concerning the disposal of tea sweepings. They believe rarely happens that the sweepings find their way on to the mark as tea. But they deem it to be of the highest importance that eve these isolated cases, if such there be, should not occur. The therefore, venture to recommend all the members of the Associ tion to exercise the greatest possible caution regarding the dispos of the waste tea from their factories, in order that no part of it m by any chance be sold for human consumption. In no case shou it be sold locally to Native buyers but should be sent to Calcutta be disposed of for chemical purposes.

Yours faithfully,
W. PARSONS,
Secretar

No. 1633—1900.—Dated Calcutta, 21st December, 1900.

From—The Secretary, Bengal Chamber of Commerce, to t Secretary, Indian Tea Association.

I am directed by the Committee of the Bengal Chamber of Co merce to forward, in original letter, dated 12th December, from t Secretary, Ceylon Chamber of Commerce, enclosing copy of a Co mercial circular printed in Holland, and containing statements alleged improper practices, on the part of Indian and Ceylo Planters, in regard to the Manipulation of tea, which are stated have been most damaging to the interests of tea on the Contine of Europe.

The Committee of the Chamber are asked to co-operate with t Ceylon Chamber in tracing the origin of this obnoxious article, b I am directed to forward the papers to you as coming more withi the province of your Association to deal with than that of t Chamber. The Committee think it might perhaps he advisable the General Committee of the Indian Tea Association would ta

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nicho son's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf peopl unable to procure the Ear Drums, may have them free.

Address—No. 989 D, THE NICHOLSON INSTITUTE,
Longcott, Gunnersbury,
Londo

[w. 26-5-00—26-5-1901.]

up this matter direct with the Committee of the Ceylon Chamber, as it is entirely connected with the interests of tea, but at the same time they will be glad to hear from you as to whether you have any other suggestions to make with regard to it, are as to what action is proposed to be taken by the General Committee.

COLOMBO, 12*th December*, 1900.

From the Secretary, Colombo Chamber of Commerce, to the Secretary, Bengal Chamber of Commerce.

I am directed by my Committee to draw the attention of your Chamber to the enclosed Circular, to which a translation is attached.

This Circular was originally forwarded to our Ceylon Commissioner in Europe, Mr. J. H. Renton, from Switzerland, with an earnest appeal to have the statement publicly and authoritatively contradicted.

Its effect, we are assured, all over the Continent, but especially in Holland (where you are aware Anglophobia is just now rampant), has been most damaging to the interests of Indian and Ceylon Planters.

Mr. Renton referred the matter to the Ceylon Association in London, and through the efforts of the Secretary and other gentlemen the following facts have been elicited.

The Editor of the *Globe* admits that the paragraph appeared in his Journal, and states that it was copied from the Calcutta *Englishman*.

Further attempts to trace the origin of the article have failed, probably owing to the anxiety of the London organ to suppress its share in this gross and damaging libel.

My Committee has been urged by the London Association to take the matter up officially, and they feel that the first step is to request your Chamber to vigorously co-operate with them in tracing the origin of the obnoxious article.

The allusion to "maunds" certainly seems to point to an Indian source, for we do not use the term here.

Requesting the favour of your early attention, and promising the ready support of my Committee to any scheme which may suggest itself to your Chamber for dealing with the matter.

BULLETIN COMMERCIAL.

De la Maison Wd. J. van der Chijs and zoon's.

Delft (Hollande), Nov., 1900.

Le Journal Jingo le Globe vient de publier un article instructif sur la manipulation des thés Ceylon et Assam. Il parait que nombre de plantateurs anglais mêlent à leurs produits les balayures de leurs fabriques de thé. On a constaté, en analysant chimiquement plusieurs échantillons, que ceux-ci renfermaient moins de 50 per cent. de thé; le reste n'etait que du sable ou d'autres déchets. Les acheteurs ont ainsi été frustrés de la moitié de leur argent.

A Ceylon surtout. cette fraude se fait, frequement; les balayures s'y vendent á 5 roupies le maund (80 livres anglaises). On peut s'etonner que des plantateurs anglais se prêtent à une pratique aussi malpropre pour un si faible gain. Mais beaucoup d'entre ceux qui cultivent les thés Ceylon et Assam, sont obligés de recourir á ce moven deloyal, pour pouvoir encore payer des dividendes a leurs creanciers.

Translation.—The Jingo paper the *Globe* publishes an instructive article on the manner in which Ceylon and Indian teas are manipulated.

It appears that numbers of the English planters mix the sweepings of the tea factories with their produce. Chemical analysis of several samples has proved that these contain less than fifty per cent. of tea, the balance consists of sand or other waste. Buyers have thus been cheated of half their money. It is in Ceylon that this fraud most frequently takes place. These sweeping sell at five rupees the maund (80 lbs. English). One is astonished that English planters lend themselves to such an improper practice to obtain so small a benefit. But many of them who cultivate Indian and Ceylon teas are obliged to have recourse to such improper methods in order to be able to pay dividends to their creditors.

No. 82-O.—Dated Calcutta, 30th January, 1901.

From the Assistant Secretary, Indian Tea Association, to the Secretary, Bengal Chamber of Commerce.

ALLEGED ADULTERATION OF INDIAN AND CEYLON TEAS.

I am directed by the General Committee of the Indian Tea Association to acknowledge the receipt of your letter No. 1633-1900 of 21st December, with enclosures,* upon this subject.

2. The Committee have given attention to the representation from the Ceylon Chamber of Commerce. They have also made enquiries into the origin of the Dutch Commercial Circular to which that Chamber refers. They find that, on the 10th September, the Calcutta *Englishman* published a Circular, issued by Messrs. Barlow & Co., of this city, respecting the disposal of tea sweepings and factory refuse. On the 13th September, a letter over the signature of "One in the trade" appeared in the *Englishman* on the same subject. A comparison of it with a *Globe* leaderette, published on the 6th October, seems to show that it is the basis of the latter. A further comparison also makes it evident that the Dutch Commercial Circular—a copy of which the Ceylon Chamber sent to you—is a more or less freely translated summary of the *Globe's* remarks.

3. Having thus, as they believe, traced the latter to its source, the Committee instruct me to say that they are in accord with the Ceylon Chamber in thinking that the effect of the Circular on the Continent must have been damaging to the interests of Indian and Ceylon tea growers. It is, the Committee think, a matter of very great regret that irresponsible writers in the public press should make statements which are certainly not borne out by the facts, and which are calculated to do harm to an industry, the present position of which is so serious as to cause grave alarm to all concerned in it. It is true that in the tea industry—as in most other industries—waste products (in this case tea sweepings) are sold by producers. But the sweepings are used for chemical purposes; they are not sold as tea. They do not, therefore, appear in the returns of tea sent to the United Kingdom; and even if they did, through accident or ignorance, they could not get into consumption there. They would be rejected by the London Customs Authorities; and their owners would have to bear the loss. Further, the quantity would be so small that it could neither depress the market, nor seriously prejudice tea as a beverage, as is suggested in the letter in the *Englishman* and reiterated in the *Globe*.

4. You will understand therefore that the General Committee are distinctly of opinion that the statement made in the newspapers should be corrected; and they will gladly co-operate with with your Chamber, and with the Ceylon Chamber, to that end.

5. In conclusion, I am to say that the Committee have submitted copies of the papers to the members of the Association, and have desired the latter to exercise the greatest caution in regard to the disposal of sweepings.

6. Copies of the newspaper articles referred to in the second paragraph are attached for information.

Englishman, 10th September, 1900.

TEA WASTE AND DAMAGED TEA.

Messrs. Barlow & Co., 37, Strand, Calcutta, have sent out the following circular:—

A considerable quantity of the above occurs on all factories from various causes, and is swept out of the tea house and thrown among the bushes or on the ash-heap. Hitherto there has been nothing else to do with it. We have, however, lately learned that though useless for human consumption, it has a certain value for other purposes. We recommend you, therefore, to have all the following collected and put into good old rice bags and sent down to us in these bags, when we will dispose of it for you to the best advantage

Tea Fluff.—This is fairly abundent in every part of the sifting room, and should be regularly cleared off the walls, roofs, beams, etc.

Tea Refuse.—This includes all pickings during sifting, tea blown into odd corners from the driers, teas accidentally left in the corners or under bins, etc., till soft and unfit for mixing with sound and marketable teas.

Tea Sweepings.—This includes all tea house sweepings after the work is done, freed of dirt and dusty earth or sand as far as possible.

Damaged Tea.—Any tea rendered unfit for mixing with sound and marketable tea, from any cause whatever, such as water, fire, or smoke, should be collected and put separately into bags. Any sunk tea, or tea otherwise damaged by water, should be re-dried as soon as possible.

It is, however, to be particularly noted that any such damaged tea is to be kept entirely separate, and not mixed with the above, till you have received instructions as to what is to be done with it.

Such tea should not be thrown away, as it is of some value.

Tea Dust.—Not fit for human consumption on account of the earthy dust mixed with it, should be sent down in bags.

* Letter of 12th December, with accompaniment, from the Ceylon Chamber of Commerce.

We believe it is the practice with some concerns to sell the above refuse locally. This is a most objectionable practice, as it frequently gets into the hands of Natives in Calcutta, and possibly out of India, and is sold as tea much to the detriment of the reputation of Indian teas. The practice is, therefore, most harmful, apart from all sanitary considerations. We trust you will do your best to stop such traffic.

We give our absolute guarantee that none of the supplies of the above sent to us will be used for human consumption in any way whatever.

N.B.—Tea stalks by themselves are useless and should not be sent down, as we are advised at present, but any normal mixture of stalks with the above refuse will not affect the sale.

Please advise us about what quantity of the above you will have available from now to the end of the present season. On hearing from you instructions will be sent to you for forwarding it to Calcutta.

To the above, Mr. J. Buckingham, C.I.E., adds the following note:—

In publishing Messrs. Barlow & Co's Circular, I would call the attention of District Chairmen to the para *re* selling refuse tea to Kvas or other traders for consumption. I have had some such samples sent me from Calcutta, and it appears to me we are doing an incalculable injury to Assam tea by allowing any such refuse to be sold for consumption.

The Calcutta Tea Association, in a Circular, dated the 10th January, 1900, alluded to the above subject, and strongly urged precautions should be taken that nothing but pure tea should be offered for sale, "in order that the good reputation for cleanliness and purity hitherto enjoyed by Indian teas may be in no way impaired."

Englishman, 13th September, 1900.

TEA RUBBISH.

To the Editor of the *Englishman*.

SIR,—The disposal of the above has recently been discussed in your columns; and I would ask your permission to draw attention to the pernicious results of selling the fluff, sweepings and sandy dust which collects in tea houses. If owners will consult their best interests they will give instructions that all such rubbish is either buried or used for manure, rather than dispose of it for chemical purposes, or for human consumption as tea. The fact of allowing any proportion of such rubbish to be included in the weight of shipments, tends to depress the markets, not only for sound clean Dust and Fannings, but for all tea. The buyer who requires tea for chemical purposes, failing this supply of rubbish, will of necessity be compelled to buy sound low grade tea, and so enhance its value. The owner, therefore, who sells quantities of sweepings at a nominal price of five rupees per maund, is doing himself and all interested in tea a grave injury. He may pocket his Rs. 5 per maund, but he loses much more than this in the price obtainable for his clean dusts and fannings, which he packs and sends to the market, and at the same time he adds materially to the weight of the visible supply of tea. I feel sure this matter only requires attention to be drawn to it, to have this increasingly harmful practice put an end to.

While on the subject, I may add that a great deal of dirty dust, 50 per cent. of which is sand, is offered on this market, which, for the benefit of all concerned, should never appear at all. It is largely bought by natives for consumption, and a most pernicious beverage it must be. If such rubbish was not available, the producer would obtain all the more for a clean pure article, really fit for human consumption. I earnestly hope that producers will interest themselves in this matter, as the evil is becoming a serious one. It is surely a case of penny wise and pound foolish. Ceylon is now suffering from allowing rubbish, which deserves not the name of tea, to be included in her shipments. I have trespassed somewhat largely on your valuable space, and the importance of the matter, as affecting a most important trade, must be my apology.

Yours, etc.,

ONE IN THE TRADE.

LONDON *Globe*, 6th October, 1900.

TEA SWEEPINGS AND THEIR MISUSE.

If the Calcutta *Englishman* is accurately informed, there is a growing disposition among Indian tea-planters to follow the same suicidal course that brought China tea into such grave disrepute. Until recently, the almost invariable practice in Indian gardens was either to destroy or use as manure the sweepings of the factories. To some extent, this rubbish is composed of tea dust but sand and even worse refuse also enter largely into its composition. In some samples subjected to analysis, fully fifty per cent. was not tea at all, and the buyers was consequently cheated out of half his money's worth. The same discreditable fraud is said to prevail to an even greater extent in Ceylon, with the result of a downward tendency in prices, both in the Colony itself and in the European market. As the sweepings only fetch five rupees a maund—80 lbs.

Apropos of the above the *Englishman* remarks:—In connection with the circular of the Indian Tea Association published elsewhere it is only fair to ourselves to state that the quotations and the letter referred to were printed in the most perfect good faith. We cannot hold ourselves responsible for the opinions of our correspondents. We would be failing in the first duty of a newspaper if we refused to give expression to forms of opinion besides our own. Those connected with the tea industry need hardly be reminded of the *Englishman's* editorial confidence in their perfect honesty and integrity. At the same time our readers will notice how grossly the facts have been distorted by the Holland firm.

* * *

Commercial Federation.

The *Natal Advertiser*, of 28th December, 1900, says:—

Moved by the danger of an attack on the interests under its peculiar charge, the United Planters' Association of Southern India, have issued an appeal to other commercial bodies in the Empire to consider the advisability of a commercial combination of Great Britain and her colonies against the world, which, by means of differential duties, would afford some protection to British-grown products and manufactures. The circular details the circumstances which have prompted this appeal, namely, the retaliatory action of France towards Brazil, in imposing double duties on the imports of tea, coffee, and spices from countries not having commercial treaties with France or not enjoying most-favoured-nation treatment. It is somewhat of a surprise to learn that among these are India, and all the British colonies, except Canada. It is easy to understand the alarm occasioned in India by the action of France, which, although directed specifically against one country only, would yet operate against many others entirely innocent of blame. The incident is, as the circular rightly states, a warning of the grave risks to which British trade is exposed. But when we come to consider the remedy opinions will inevitably differ. The Association urge a commercial combination between Great Britain and her colonies, which will impose differential duties on foreign-grown products, and thus afford protection to British-grown products. Now we have a firm belief that before the century upon which we are now entering is past its infancy some such combination will be an accomplished fact. The precise nature of the compact is, of course, a matter of pure speculation. Canada, has however, shown the way, by inaugurating a differential tariff in favour of the mother-country. No doubt, the basis of such a combination will be, as is now the case with Canada, reciprocity, *i.e.*, that those countries which admit British and colonial products on fair terms, will have the same terms granted to them. But while admitting that an Imperial commercial combination is a probable result of the "closer union" between the mother-country and the colonies which has been so marked during recent years, we do not think it will come as the outcome of any endeavour to protect any one particular industry. With regard to the case now under discussion it seems to us that the danger to which reference is made is due to the carelessness with which the treaties between India and the colonies and France have been negotiated. If care had been taken to safeguard their interests by insisting on most-favoured nation treatment, the present difficulty would not have arisen. When Canada adopted her new fiscal policy with regard to Great Britain a similar difficulty arose. It was found that the treaties between Great Britain and Germany, and Belgium did not confer most-favoured nation treatment upon Canada, and as they interfered with the desire of the Dominion to give preferential treatment to Great Britain the treaties were denounced. The same course ought to be adopted with regard to all the colonies. All commercial treaties between Great Britain and any foreign country should be negotiated on the basis of the Empire as a whole, *i.e.*, most favoured treatment should be common to the whole Empire. That would of itself establish the commercial unity of the

npire in a striking manner, and would prevent such difficulties those referred to in the circular. That would, at any rate, be a st step towards commercial combination, and if the action of the uthern Planters' Association leads to any movement in that rection it will be a benefit to the Empire.

* * *

The Middlesborough Chamber of Commerce discussed the . P. A. S. I's suggestion at some length. In a report of a eeting held on 17th ultimo, the *North Star* says :—

ENGLAND AGAINST THE WORLD.

The Secretary reported the receipt of a letter from the United anters' Association of Ceylon [*sic*] in which it was stated that at the nual meeting of the Association, held at Madras [*sic*] in August, was decided, after considering the critical condition of the tea d coffee industries, the Association should communicate with the dian Tea Association, the Ceylon Planters' Association, the dian Chambers of Commerce, and the many firms of merchants d brokers interested in the tea and coffee trades in England and r colonies, with a view to ascertaining whether a movement in vour of a commercial combination of Great Britain and her lonies and India against the world, which would be a system of fferential duties, and afford some protection to British-grown oducts and manufactures, would receive support. The resolu-on, said the writer of the letter, might be said to have resulted om the recent revision of the French tariff with regard to the port of produce from India and the British colonies and pendencies. They were, doubtless, aware that the French Govern-ent had recently passed a law doubling the duties on coffee, tea, d spices imported from countries not having treaties of commerce th France, or not enjoying most-favoured nation treatment, nongst which were India, the British colonies and dependencies, th the exception of Canada. Although it was possible that the ench Government might be induced to reconsider the action ferred to, what had been done already served as an unmistakable rning of the grave risk to which British trade was at present posed, and the burdens it might be called upon to bear. There as a strong and growing feeling in favour of what might be termed perial fiscal federation for the protection of British interests ainst those of the rest of the world.—The Chairman: They are oking after the interests of their own trade.—Mr. Grigg thought e only possible solution would be free trade within the Empire. he scheme was an immensely important one, and he thought the clination of that Chamber had been to support such an idea as a eans of welding the colonies more closely still to the mother-untry. He did not think it would be possible for them to support resolution which came from a Trade Association. That was an tremely big scheme, and should be dealt with by other than trade thorities for the protection of their own trade.—Mr. Dawson id they wanted the whole of the nations of the world as eir customers. and that was proposing that they should go against l the world. Unless they were going to get something substantial om the colonies, it was not worth their while. He did not think ey had sufficient information.—Alderman Wilson: Has not the ew Commonwealth of Australia agreed to support a free trade olicy?—Mr. Grigg: It is still the subject of discussion.—The hairman: If we combine in this matter against the world, the world ay turn round and combine against us.—Colonel Sadler said they ould not combine for offensive action in the way it is put in this tter. There was nothing to prevent Great Britain having a iendly alliance with her colonies, with proper differential rates. was not necessary to have free trade between the mother country nd her colonies, because the circumstances of some of the colonies ould not warrant them in giving up so much for many years to ome. Their revenue was largely dependent upon the duty on goods nported. Everyone would like to see a friendly alliance with the olonies, with a view to greater inter-commerce between us and em. He thought the answer to the question should be that that hamber was in full and complete sympathy with the desire that ere should be a friendly arrangement, with differential other rrangements, that might be satisfactorily and mutually agreed pon, with a view to the extension of trade between Great Britain nd the colonies. They should say nothing about "against the orld."—The Chairman: That is the most objectionable feature.—lderman Wilson said Canada was now giving England advan-ages.—Colonel Sadler proposed that a letter such as he had suggested should be sent.—Mr Grigg seconded, and the motion was carried.

The Acting Honorary Secretary of the Central Travancore Planters' Association has sent in the replies he has received to the enquiry of the Indian Tea Association *re*

* * *

Compulsory Cess.

The replies represent 8,203 acres, and are without one dissentient voice in favour of the suggestion of the I. T. A. The whole district, with one exception, whether members of the Association or otherwise, is represented in these replies. The Acting Honorary Secretary remarks :—The conception in question I have not yet had time to hear from, but, as he is an old and loyal Ceylon man, I have not a doubt he will fall into line with the rest of us.

NOTES.

Cinchona in London. A firm market is reported. Price per unit 1½d. Monthly sales 1,100 packages.

Coffee in London. Latest cables state :—Stock 13,991 tons ; fortnight's landings 1,000 ; deliveries 1,900 tons.

The Production of Coffee. During the last ten years the production of coffee all over the world has about doubled !

Planters' Association of Ceylon. Mr. W. D. Gibbon will, at the annual general meeting of the Planters' Association to-day, propose that Mr. Edward Rosling be elected Chairman for the ensuing year.

Salada Tea. Twenty-eight per cent. is the exact increase in the "Salada" business in the city of Toronto. The *Canadian Grocer* remarks :—This, after the tea has been ten years before the public, makes it the more gratifying.

Tea Stocks in Australia. Stocks in bond in Melbourne on the 12th ultimo were 5,694,741 lbs., as against 3,146,948 lbs. at same time last year. Stocks in bond in Sydney on the 11th ultimo were 3,029,690 lbs., as against 1,498,670 lbs. at same time last year.

The British Tea Duty. Forced buying of Tea in London lately appears to have been partly induced by the doubt whether there may not be a further enhancement of the import duty very shortly. Such an increase is regarded as at least a possible contingency.

Indian Coffee for the United States. More coffee per head of population is consumed in the United States of America than in the rest of the world. This makes all the more significant the fact that East Indian coffee is almost unused in the States. Indian and Ceylon tea-planters have worked hard to cultivate American demand and taste. What have Indian coffee-planters done ?

Calcutta Tea Sales.

At the tea sales at Calcutta on February 6th, 14,000 packages were offered, and a few useful Assam invoices were shown. The bulk of the offerings were of ordinary quality ; and between 2,000 and 3,000 packages consisted of dust, and odds and ends. Prices were irregular, but may be quoted as fairly steady. All decent liquoring teas continued to meet with a strong demand.

A Tea-Testing Spoon.

The *Canadian Grocer* says :—Tarrant, Henderson & Co., tea exporters, Colombo, Ceylon, are distributing among the wholesale trade in Toronto, through their agent, Mr. Fred. Dane, a silver tea-testing spoon. On the handle, besides the firm's name, is a maple leaf in relief. As the wife of Mr. Henderson is a Canadian, this probably accounts for the presence of the maple leaf design.

The Ceylon Import Duty and Rubbishy Teas.

The following resolution is to be proposed at the coming annual general meeting at Kandy to-day by Mr. "Edgar Turner :—That in the opinion of this Association the time has arrived to approach the Government of Ceylon, to ask for (1) the abolition of the import duty on Tea in Ceylon, (2) the appointment of Inspectors to guard against the export and import of rubbishy teas."

Cheap Ceylon Teas for Canada.

A Montreal correspondent says :—There have been reports of some trading in Ceylon teas at ridiculously low figures, 9½c. c.i.f. for Pekoes, but some believe that the contracts will hardly be filled at this figure. The quotation came from Colombo, and as London has been ruling lower than either Calcutta or Colombo it seems strange that this break should occur which puts the primary market below London.

The Annamalai Hills.

A correspondent of the *Madras Mail* recently stated that over 2,000 acres had been planted-up on these hills, about 1,000 acres being under coffee. He remarked :—"I have picked about 1½ tons of crop from plants, a few hundred of which were put out very late in 1897, the balance in 1898, and at the present time not only all the 1898 but a large proportion of the 1899 planting has a large, even spike, promising a fine blossom after the next rain. Quality of bean looks excellent, and I am having the above small lot cured and shipped." Tea, rubber and cardamoms are also being grown.

Good Prices for Bark.

Mr. W. R. Tatham writes to a Colombo paper :—"With reference to Mr. Geo. Christie's letter giving prices realised by him for a parcel of cinchona bark sold in November last, it may also interest your readers to know that a parcel of bark sold in London in August last, from Oolapane estate, fetched even a better price than that from Kanapediwattie ; the prices being as follow :—

Stem bark sold at 10d. Sterling a lb.,
Branch bark sold at 7d. sterling a lb.,

the average price for the whole parcel being 9d. a lb., or, say, at present rate of exchange, cents 54 per lb.

Tea in Australia.

Melbourne advices dated 22nd ultimo report a steady market ; Sydney showed more animation. Messrs. Alfred Harvey & Co. remar about Ceylon Tea :—"Shipments from Colombo to date a 12,925,000 lbs. as against 10,820,000 lbs. at same time la year. Consignments have been on a somewhat smaller scal without, however, any improvement in quality, and the mark has been a dragging one. Medium Broken Pekoes have bee in full supply, and show good value to buyers. Low commo Souchongs have been immovable, and shippers are apparentl not now further loading the market with quite such undesirabl sorts as have found their way here of late. Stocks in bon on the 12th instant were 960,718 lbs."

The Multiplication of Pests.

Discussing Government's respons bility to planters in respect of inse pests, the *Nilgiri News* remarks :—"That efficient conservancy, to which we owe the flourishin condition of State Forests, is what preserves the insects aliv and enables them to travel beyond the natural woods an menace the planters' industry. One of the most effectiv measures of conservancy is a firetrace, which keeps periodica conflagrations out of the forests thus protected. In forme years, this was unknown and, consequently, once in two o three years, great fires ravaged the forests and destroyed th myriads of insects that found shelter in decayed trees an shedding barks. Now this purifying, or destructive agenc is kept out of the forests and hence the multiplication insects inimical to tea and coffee."

Tea Consumption in the U. K.

The total English imports of te have risen by 35 per cent. in sixtee years. In 1884 they were 214 millio pounds ; in 1899 they were 289 million pounds. Englan lost at the same time a quarter of her re-export trade, showin that the habit of tea-drinking is increasing among the popu lation. The consumption in the United Kingdom is no nearly 6 lbs. of tea per head of the population. There i no European country (except Holland) where the tea-con sumption exceeds 1 lb. per head. While more tea has bee consumed it has been cheaper tea, its value for custom having fallen from 11¾d. per lb. in 1884 to slightly unde 9d. in 1899. The basis of the tea-trade has shifted. In 188 65 per cent. of England's tea was supplied by China and Japan now they only supply 14 per cent. In 1884 Ceylon sent tw million pounds of tea ; in 1899 it had risen to 102 millions.

Java Quinine.

On December 8, a circular wa issued by Messrs. Tiedemann and va Kerchen, representatives of the Bandong quinine factory, t all interested in cinchona and quinine in Java. It ran a follows :—"We enclose copy of the conditions for the suppl of cinchona to the Bandong quinine-works for the 190 auctions which it is proposed to hold on the first Wednesda after each auction of bark at Amsterdam. We presume tha you have followed the course of the quinine-auctions durin the year 1900, and it may have struck you that the differenc in the unit price between Amsterdam and Batavia ha gradually diminished, and at the last auction, held o November 28 at Batavia, there was a difference of ¾c. pe unit in favour of the last-named place. We would, therefor advise you to send at least a portion of your annual harves to our factory. We enclose tender-form, which kindly retur filled up and signed."

nam Tea.

The English *Daily Messenger* (published in Paris) states :—"Some statics have just been published which show the great increase the importation of tea from Annam which has taken place thin the last eight years. In 1892-9 France imported only 8 kilos. ; in 1895, the importation was 3,742 kilos ; in 1898, was 18,000 ; in 1899, in anticipation of the Exhibition, it ıped to 60,000 kilos. ; while in 1900, it is expected to be out 100,000 kilos." In writing on tea from Annam, a ench journalist states :—" We must admit that it is wanting aroma ; but this is of secondary importance. In certain ses aroma is a thing that can be added ; it is easy to add it, d to do so only requires a certain *technique de fabrication*." is a pity to spoil so charming a phrase—an ordinary writer ould have said—adulteration. The French phrase, however, so delightfully vague that we record it. But what do the e o'clock tea drinkers think of this method of supplying oma ?

---

ondon Proposals on the Tea Problem.

A special telegram dated London, 11th February to the *Times of Ceylon* says :—The special Joint Committee the Indian Tea Association and the Ceylon Association in ondon have issued a further report, in which their recomendations are as follow :—

Estates averaging 11d. on their 1900 crop to January, 1901, to exempt.

Estates averaging from 9d. to 11d. during the same period to duce their output by 5 per cent.

Estates averaging from 7d. to 9d. to reduce their output by per cent.

Estates averaging 7d. and under to reduce their output by per cent.

The reduction to be allowed in various ways, either by stricting the area, by finer plucking, by making green tea, by sending tea to exploit the native Indian market, for hich a plan is being prepared. The scheme to be contional on the estimated reduction aggregating 18 millions. he Joint Committee further strongly deprecate any new earings.

---

uinine Auction in Batavia.

Detailed particulars of the October quinine auction in Java are given by the American Vice-Consul as follows :

-1. Editio I., consisting of 3,175·2 kilogs. (7,000 lbs.) in ts of two cases containing eight tins with 22·68 kilogs. 5·02 lbs.) ; sold at 23·45 and 24·60 fl. per kilog. (2·2046 s.). 2. Editio II., consisting of 750 kilogs. (1,653 lbs.) in ts not less than 22·68 kilogs. (50 2 lbs.), and not above 5 kilogs. (55 11 lbs.) in weight, packing at purchaser's otion ; sold at 23·45 and 24·60 fl. per kilog. The average rice realised, 24·34 fl., equals the unit price of 0·0992 fl. for e bark at Amsterdam. 3. Editio III., consisting of 120 ilogs. (264·5 lbs.) in five lots of one case of 24 tins of one ilog. each (52·9 lbs.). Two lots were sold at 28 fl. per ilog., but the remaining three lots, not realising the limit, ere not sold. Although there were few buyers and the idding was slow, the Vice-Consul added the fair prices were ealised.

---

ondon Tea Market.

Messrs. Gow, Wilson and Stanton's cable dated 7th instant reports that here is a dull tone generally among buyers and that the arket for medium liquoring pekoes and broken pekoes shows a slight decline ; while the market for common pekoes and broken pekoes also shows a slight decline. The price of fair liquoring Ceylon Pekoe Souchong is 5d. (a farthing down) and the average price of Ceylon tea sold on garden account this week was 6¼d. (an eighth of a penny down)—as against 6½d. and 7½d. respectively in the corresponding week last year. *Reuter* reports that fine qualities of Ceylon tea are steady, while the market generally is easier. Pekoe Souchongs are quoted at 4d. one eighth of a penny down) and the average for the week at 6¼d. (a farthing down) as against 6½d. quoted for Indian tea : 28,000 packages of Ceylon tea were offered for sale, of which 23,000 were disposed of ; while of the 59,000 packages of Indian tea offered, 48,000 found purchasers.

Coffee in London.

The *Produce Markets' Review* of 19th ultimo says :—Supplies of new crop Central American, together with some old crop which had been kept in the parchment and only recently husked have been offered more freely, and a large proportion found buyers, thus establishing a more fixed market than has been observable for some time. The quality of the new crop, particularly of Costa Rica, continues by no means satisfactory, and rates are in consequence much below those ruling for the same marks last year ; the few really fine parcels fetched, however, very satisfactory prices. Importers of new crop East India would not accept the prices offered, and only a few lots were sold, but should the quality of the later shipments turn out as well as is reported there will no doubt be a good demand from the home trade. In the terminal market very little has been done, and the quotations have hardly varied, but at the close with smaller Santos receipts an advance of 6d. has taken place.

Tea in London.

The *Produce Markets' Review* of 19th ultimo reports regarding Indian Tea :—A steadier tone has prevailed in this market and the bidding at the public sales has shown more animation than for some time past. Common descriptions have attracted more attention, and although there is no quotable change in values the tendency has been firmer, and last week's prices well supported. Some of the Teas notably from the Sylhet and Dooars districts are of improved quality and have been readily bought, and there appears every probability that the market for the more useful kinds ranging between 5½d. and 7d. will become distinctly firmer as the future imports bid fair to contain a smaller proportion of these Teas. The next better descriptions have been briskly competed for, and a large business has been transacted at in some cases advanced prices, while the tendency is to still higher values. The finest kinds still continue in limited supply and advanced prices has been recorded, a few stand-out parcels having been actively bid for and show a distinct rise. At the public sales 54,639 packages were catalogued and 49,395 passed the hammer, while a fair portion of 5,234 withdrawn was afterwards sold.

Proposed Quinine Laboratory in Java.

The *Chemist and Druggist* says :—There has long been felt in Java an urgent need for a laboratory for the examination of quinine, and of everything connected with the cinchona industry, such as the analysis of bark, manures, soil, &c. The absence of such a laboratory has been a source of

great inconvenience, the planters having had considerable difficulty in ascertaining the comparative values of certain varieties of bark. In addition to this there has been no ready means of testing the quinine intended for the Batavia auctions. The analyses were either made by Mr. P. van Deersum, Director of the Government Cinchona Plantations, or samples were sent to Holland for analysis, in which case the results were only known after a lapse of about three months. When the unit price was low and a small increase in the quinine-content of the bark was of comparatively little value, these means were considered sufficient, but since the industry has become more flourishing, and the majority of the planters send their production to the Bandong works, the establishment of a properly equipped public laboratory in Java has become an urgent matter. A Committee was therefore formed, and after several meetings they report that the proposed laboratory should be established without delay. At the head of it should be placed a capable chemist holding a diploma from one of the Dutch Universities, whose engagements would be for a term of five years, the remuneration to be 500*l.* per annum to commence rising by yearly advances of 50*l.* to a maximum of 700*l.* An allowance of 125*l.* is to be made for travelling expenses to India and Europe, the latter for the purpose of studying the arrangement and practice of some of the large European laboratories. It is estimated that the total amount required for the five years will come to about 4,200*l.* against which must be placed the receipts from analyses made. The charge for analyses would be 5fl. (8s. 4d.) to members, and 10fl. (16s. 8d.) to non-members. A yearly total of about 2,000 examinations would, it is said, be sufficient to cover expenses.

LETTERS TO THE EDITOR.

OVER-PRODUCTION.

DEAR SIR,—Before leaving for a short stay in England, I have been asked to publish my views on the Tea Question with reference to over-production, &c., and have sent a letter to the *Madras Mail*, &c., of which I enclose a press copy. If you can spare the space in your paper, I shall feel obliged if you will publish the enclosed letter in an early issue.

PEERMADE,
4th February 1901. GEO. NICHOL. THOMSON.

[INCLOSURE.]

SIR,—I have read with much interest a Circular on "Position of the Tea Industry" sent out by the Indian Tea Association, and at present being circulated in this district by the Hon'ble Mr. G. L. Acworth. I have given my opinions on the above subject to Mr. Acworth and he has advised me to publish them and if you consider my suggestions of any value, I shall be glad if you will publish same in your paper. I do not think that any of the suggestions in the circular are of much value because they all aim at curtailing the yielding capabilities of individual gardens, and by their nature all are necessarily voluntary schemes. It will be found impossible to get a majority of the tea planters in India to agree to any scheme that interferes with the immediate management or cultivation of their estates, such as abandoning portions for stated periods, rules as to plucking and destroying of inferior teas.

I may be wrong, but it is my honest opinion that all shou take a wider view, and that expansion of outlets, and n reduction of output, should be the main object of everyo interested in the tea industry. Any scheme with the obj of reducing output, would, if at all possible, only be of temp rary relief. We must remember that there is still a larg acreage to come into bearing. A new market for our tea or a present market extended, would be a permanent bene to the industry as a whole, so it is my opinion that nothin will be done of much consequence in the present crisis to r lieve producers, until Government are induced to pass a *co pulsory cess*, on all tea leaving India, the same as is now force in Ceylon.

The letter addressed by the Secretary of the Indian T Association to the Secretary, Government of Bengal, Revenu Department, on "An Indian export duty on tea" or what would rather name, an appeal to Government to assist t planters in collecting a cess to enable them, in the prese crisis, of collecting necessary funds for preserving a larg Indian industry from ruin, I say, as this letter has not receive a favourable reply, I would suggest a vigorous agitation i the tea Districts of India, in Calcutta, and in London by th Tea Associations there, in order to induce Government to giv a little help to those who are so anxious to help themselve We at the present time are fortunate in having as ou Viceroy an enlightened statesman, who will not be boun down by red-tape, and who, I am sure, is wise enough to b guided by a precedent that has worked so well in Ceylo With the funds that a compulsory cess of, say, 3 annas pe 100 lbs. would bring in great results, I am confident coul be accomplished. An overland trade in green and black tea with Russia, Tibet, &c., could be pushed and energetic step taken to make a large market for our teas at our door. Wit a capable business man resident in Calcutta, as manager o an Indian market fund, and a competent staff under hi great results would reward continued efforts, in pushing ou teas in India itself. It is true that it will be a hard task t educate the natives into the use of tea, but we must remembe that tea-drinking was originally an Asiatic custom. Th millions in China, drunk tea before it was known in Europe I recently wrote to the Ceylon papers on this subject under *nom de plume* and the gist of what I wrote applies to India and is contained in the following five propositions, whic I will put here in the order of merit, the first of which doe not yet apply to India.

1. Increase the tea cess.

2. Agitate for a reduction on the duty on tea at hom and keep on agitating until a reduction is made.

3. Moderate manuring. Manure more for quality tha quantity.

4. Waste no valuable time on wild schemes for reducin output, but concentrate all attention on the means for increas ing the demand for tea.

5. Advertise, advertise, all over the world.

6. Those interested in producing should endeavour t become interested in the large distributing companies at hom and a reserve and Extension funds of tea companies, migh be used for buying shares in companies at home, like th Mazawattee, &c.

I hope others interested will come forward with their views on this question, at this present time, which all admit is a very critical period to tea producers, both in India and Ceylon.

COFFEE.

SIR,—I. A. Rucker & Bencroft's market report of 7th timo, received by the last mail, contains the following notes the position of coffee :—

" It is interesting to note that, during the past six years, eliveries on the average have increased by 35,500 tons er annum.

" Thus for 1901 it might be argued that deliveries should tal, say, 885,000 tons against 851,500 tons last year. Most eople will be of opinion that invisible stocks are larger than ey were in 1894 or 1895 and that the figure of 33,500 tons rather on the heavy side. It is amusing, but at the same me instructive to note that, if 30,000 tons = 500,000 bags = 3½ % increase on last year's deliveries, be taken as a fair ssessment of annual increase ten years hence, we shall require, ell ! Let our readers make the calculation for themselves. nother interesting way of looking at the position is to note at our visible supply is now 447,000 tons against two years go 391,000 tons, and it might be argued that, at the present me, we are only producing 30,000 tons = 500,000 bags = ½ % coffee in excess of requirements, a comparatively unimortant quantity."

" *With a large crop in front, it is no use pushing these argu-ents but those who live will see sooner or later a wonderful ransformation.*"

Now, Sir, is this prophetic last clause (the italics are mine) n our favor or not? The Santos correspondent of the *Brazilian Review* gives, as far as *we* are concerned, a hopeul view of the position in so far that he asserts that, in conseuence of the ruinous prices to Brazilian planters, add to hich their labour and transport difficulties, that the much-alked-of record crop on the trees now is not likely to be icked, for, says he : " Should the currency price of coffee ontinue to remain as low as at present, a great many of our lanters will not even be able to have labour, and we presume rom all we said before that, however brilliant the outlook for he next crop may be now, a large percentage of it will not be arvested unless currency rise again, and that in the near future, ecause the preparations for the crop have to be undertaken n a short time. It is therefore foolish on the part of Brazian finances and of coffee dealers in consuming countries to ase any calculations on the fact that a large crop of coffee ay be on the trees." * * * Difficult and anxious imes are again in store for the Brazilian coffee grower.

In the present state of affairs, it is more likely production vill *recede* than advance and a more healthy supply and emand be established to the comfort of all concerned ! !

SO MOTE IT BE.

GENERAL ARTICLES.

BANANA FLOUR.

A few weeks ago a friend who lives close to the Buff Bay River, ent us some flour made from the full green bananas ; we had it ooked in various ways, and preferred it to cornmeal, yams, or oco. The people living near the river after taking off the skin, ut the banana in thin slices and lay them on the stones, one day's ot sun is sufficient to dry them, after which they are put in a nortar, pounded and sifted, and the flour is made. We made 10½ uarts flour from two bunches of bananas and borrowed a mortar hat (we did not know) had been just used for pounding castor-oil uts. This oil-flavoured flour we gave to the horses and they ate it reedily. Banana flour is not a new thing, and may never become one of our exports, but what is to prevent the people, when they go to their fields, drying their waste bananas while they are working and carrying the dried pieces home to pound at night. Sheds could easily be put up in the fields to protect from rain. When there is no demand for bananas for export, sufficient flour might be made to keep over the months when there is demand—and then the small bunches could be utilised. Breadfruit can be made into flour in the same way as the banana. If the flour is not good enough for ourselves, we can feed it to stock. I have seen cattle and horses eating half-rotten bananas and breadfruit. How much better for them would be banana or breadfruit flour.—*Journal of the Jamaica Agricultural Society.*

THE COFFEE SITUATION IN THE UNITED STATES.

Mackey & Small, coffee importers of this city, have issued a review of conditions that have governed coffee, which shows that its position is one of over-supply. They say :—

" It is our opinion that the advance that took place last year was brought about from three causes. *First*, the bubonic plague, necessitating the quarantining of vessels for a long time, and, in the opinion of many, there was no relief in sight. This fact caused a transfer of seaport stocks to the interior in this country and Europe of fully 1,000,000 bags.

" *Second*, the estimated Brazil crop of 10,000,000 bags, which turned out 9,000,000 bags.

" *Third*, that the mild crops, including Victoria and Bahia, would fall short of the previous year fully 750,000 bags.

" The transfers of stocks and the final outturn of Rio and Santos crops together thus amounted to 2,000,000 bags. The elimination of this weight of supplies at seaports caused the momentary advance in prices. At the end of the crop of 1899-1900, the much-predicted decrease in milds, Bahia, and Victoria did not materialize. The bubonic plague proved to be imagination served as a subterfuge. The receipts up to December indicate total for the season of 10,000,000 bags. This supply is corroborated by reports that the hulling out of the cherries shows an increase of 10 to 15 per cent in weight over last year's crop.

" The deliveries so far show a decrease of about 1,000,000 bags, compared with last year, which reasonably proves that the consumption has been feeding on the transferred supplies mainly made on the bubonic plague. With a visible supply on December 1 of 7,900,000 bags, we are in the same statistical position as we were when options were 4·10, without taking into consideration the prospects of the next crops.

" In looking back, we find that December, 1882, records the lowest price for coffee up to that time—5 cents for No. 7 on the Coffee Exchange in New York, and 2$000 for the same grade at Rio Janeiro, with Brazil Exchange at 21d.

" In seeking the causes that established this price, we find the most important factors were the sudden increase in production, the quickening of supplies to seaports by new means of transportation, and the establishment of exchanges for future operations to the detriment of spot values. These conditions augmented supplies at seaports much beyond natural yearly production, and brought about the low value then established. Even at that time, we believe that consumption was greater than the actual production.

" Owing to generally improved conditions of labour and the great change in the systematic introduction of coffee to the consumer by roasted pound package, we find that with average Rio and Santos crops from 1882 to 1896 of 6,000,000 bags, consumption had overtaken production, also the supply, and influence of future sales, which in turn caused the inevitable result, the great inflation of values in 1887, when No. 7 on 'Change reached 22 cents. Part of this rise was owing to failure of the 1887-1888 crop by reason of climatic conditions, but the principal cause was consumption overtaking supply.

" This sudden advance brought a flood of substitute sin the market and an almost total absorption of working stocks. The average price from 1887 to 1891 was a high level, and relief from what appeared to be a coffee famine came from the crop of 1891-1892.

" The average high values from 1887 to 1897 stimulated production, being greatly assisted by the mode of cultivation in the Brazils

through Italian labour. The result of all this brought to the market the gigantic crop of 1897-1898, which amounted to 10,500,000 bags, and marked the beginning of the first period of over-production. The two following crops of 9,000,000 bags each relieved the pressure to some extent caused by the 1897-1898 crop.

"The war with Spain created a belief that duty would be imposed on coffee in the United States. Then came the bubonic plague scare. Both reports were accepted by the public, and served their purpose in advancing values, although they never materialized.

"After two crops of 9,000,000 bags and having received five months' receipts of the present crop, the visible, supply December 1, is within 100,000 bags of the largest recorded stocks. It seems to be the consensus of opinion that the present crop is 9,500,000 to 10,000,000 bags, and the next will be 11,000,000 to 11,500,000 bags.

"We can, therefore, safely say with these lights before us that we are in reality in a period of over-supply, brought about by over-production of coffee, and not by increased means of transportation or the new methods of doing the coffee business."—*American Grocer.*

FIBRES, ETC., IN BEHAR.

In the course of remarks on Indigo Land, a correspondent of the *Englishman* says that, as auxiliary crops, sugar and fibre plants are also receiving attention. He then writes :—

FIBRES AND COUNTRY CROPS.

On either side of the avenue leading to the bungalow are plots of fibre-producing plants. Three kinds of *Sansevieria,* or Bow string hemp, are being grown, the *Trifaciata,* the *Zeylanica* and the *Cylindrica.* It is estimated that results will show about 1½ tons of fibre to the acre. The plots are being treated with *seet.* Some eight acres of land have been set apart for the cultivation of rhea. The *Nivea* variety composes the bulk, but a little *Tenacissima* is also being experimented with. From root cuttings put in last year three crops have been cut, the plants averaging six feet high. The rhea is being grown on old indigo land, and is also being manured with seet. The plants are in rows two feet by four feet apart. One of Faure's decorticating machines has been ordered and in view of the careful and methodical manner in which the experiments are being conducted they should go a long way towards solving a problem about which so much controversy has long been rife. The literature on the subject of ramie has attained colossal proportions, but it is difficult to separate the ounce of fact from the tons of useless theory and valueless statistics. What the planter in Behar would like to know is whether it will pay him to plant out a portion of his lands to grow ramie and what it costs to produce the fibre in a marketable state. He wants definite information as to how many and what sort of crops can be cut during the year? What weight of ribbons or filasse can be obtained per acre? The rhea responds to manure, but does the extra growth compensate for the additional expenditure? What is the best method of dealing with the plant after it is cut: which decorticating machine can be recommended and what are the actual capabilities of the various patents now on the market under ordinary working conditions? Questions like these must occur to any planter who is considering the advisability of taking up the cultivation of one of the most beautiful and valuable textile fibres in existence. The experiments at Dalsingh Serai will no doubt throw considerable light on a subject which is at present a very open one. If, as is hoped, they indicate a profitable outlet for the planters energy and capital we may trust to see the cultivation of rhea in Behar undertaken on a sufficiently extensive scale to guarantee the manufacturers at home laying down machinery, etc., with the knowledge that they can depend on receiving constant and uniform supplies of the raw material to keep their looms running and meet the demand created for ramie made goods. It must be evident to all that the cultivation of a textile plant like ramie on the garden plot system is unlikely to prove much of a commercial success: if it is worth touching at all it is worth handling on a comparatively big scale. On a strip of land close to where the fibre experiments are in progress Mr. Coventry showed me fourteen different plots devoted to Indian rape, from which colza oil is extracted. The object sought to be ascertained is the most suitable manure for this plant. The experiments last year proved very successful. The yield of seed from an unmanured plot was equal to 4½ maunds per acre, while the application of chemical manure gave 32 maunds per acre, an increase of over 7 per cent. One cwt. of the manure entailed the additional expe of about Rs.15 per acre, 4½ maunds per acre, is a low average yi and it is possible to get 8 or 10 maunds from ordinary unmanu lands in this district. In the same way the average yield on manu land may be put, say, at 20 to 25 maunds per acre. Based on th calculations a substantial profit seems to be assured to the plant who are disposed to follow Mr. Coventry's lead in the use of artific manures. Last year's experiments had reference chiefly to the ki of chemical plant food most needed, but those now in progress a intended to determine the exact quantities required to give pa ing results.

TEA IN THE UNITED STATES IN 1900.

The year 1900 proved very unsatisfactory to the importers of te says the *American Grocer.* Many, anticipating that the war wi China would lead to a heavy reduction in supply, imported large and the result has been an overstocked market. and sales at a lo The purchases of Congou tea for the season of 1900-01 mount up 18,500,000 pounds, or double the annual average import for t preceding three seasons. For months there has been a saggi market, and few, if any, importers made any money this seaso The total consumption for the year will be about 90.000,000 pound The amount of tea in warehouses at the close of the year is six more million pounds greater than held January 1,1900.

The following table shows the average monthly quotations standard grades of Japan and Formosa Oolong tea :—

	Japan. Good to Medium. Cents.	Formos Superio Cents.

ARROWROOT AND GINGER IN QUEENSLAND.

Mr. W. Castles, of the Logan Butter Factory, who has ha extended experience in arrowroot cultivation, whilst writin in very complimentary terms in the November issue of th *Queensland Agricultural Journal,* says :—

"I notice in your Farm and Garden Notes for December yo state 'Arrowroot and Ginger may be planted.' As one of the ol est arrowroot planters, I found that the earlier we got our arro root planted, the heavier was our yield of starch. Early in Se tember, we found to be our best planting time, and when we ha dry seasons, the largest bulbs were planted. This enabled the pla to be nourished, and to grow up a large and strong pla even in a dry season, and when rain came in those years, som times in December, the plant had reached four feet high owi to the nourishment obtained from the bulb alone, and we ha a heavy crop. We found the arrowroot which, in the seventie we occasionally planted in December, was only fit for see It was so late in the flowering that the frost of the ensuing Wint had overtaken it before the bulbs could mature, and the result w very little starch. Indeed, our December planting was always i tended to provide seed only for the next Spring. With regard ginger, we grew this for years and found out that it is essentially

plant requiring shade. If you notice the wild ginger, the native of the colony, you will always find it in the richest soil, and in the deepest shade of our scrubs. After trying for years to grow it by early planting, and having the mortification of seeing it cut down to the surface of the ground by the hot sun, I tried the experiment successfully of planting corn thickly in the rows on the land I intended to plant with ginger, and when the corn had grown high enough to give sufficient shade, I planted the ginger in rows between the rows of corn. I did not allow the corn to remain longer than the ginger required the shade, but cut it down for green feed. Ginger requires rich land and allowing the corn to mature would injure the ginger crop by robbing the soil.

Our contemporary remarks:—We quite agree with Mr. Castles as to the time for planting arrowroot. In the early days he speaks of, we planted arrowroot in September, and heavy crops resulted. In our October issue of the Journal we recommended planting in October (The Field in October). But circumstances will occur in farming which often made it impossible to do the right thing at the right time. The mill may break down in August, at the height of the season, or heavy rains may set in, rendering it impossible to get on to the land with horses. What we had in view in stating the arrowroot might be planted in December, was to point that that month is not too late for planting, although possibly the resulting crop might be deficient in starch. Those who are planting ginger would do well to note what Mr. Castles says about shading the young plants.

PEPPERS OR CHILLIES.

The Queensland Agricultural Journal inquires why should not Queensland enter upon the production of chillies on a commercial scale? and then proceeds to say :—

The capsicums grow luxuriantly in all parts of the Coast country, and bear fruit almost all the year round. Their cultivation affords for less labour than the cultivation of cereals, sugar-cane, or, indeed, of any other farm crop except Sisal hemp. The plants should be set at a distance of 4 feet in the rows, and from 5 to 6 feet between the rows. They will grow on almost any kind of soil, but prefer a dry, rocky soil with sandy loam, containing some lime. It is difficult to arrive at a correct estimate of the yield of tried capsicums from a well-grown shrub during the year. Some estimate the annual return at 2 lbs., others say that 3 lbs. and even 4 lbs. may be reckoned on. The selling price of dried chillies in the London market varies from £18 to 34 per ton according to quality—for instance, in April, 1899, fair red Zanzibar sold at 29s. 6d.; good red Japan at 33s. 6d. to 34s. per cwt. The present wholesale price in Brisbane for dried chillies is 1s. per lb., equal to £112 per ton. A sample of capsicums grown in the West Indies, dull and uneven in colour, was valued at 20s. per cwt. What is evidently required is an article bright in colour, even in quality, and possessing great pungency.

The Government botanist has received a sample of a large red, sweet capsicum dried in such a manner that the skin is perfectly transparent and the seeds inside are quite dry, and can be shaken like the dried peas in a "rattle-pod." We have no information as to how the specimen was dried, whether naturally or artificially, but the pod was certainly not opened previous to drying.

A consignment of capsicums prepared in this manner would, no doubt, bring a good price in the English market. Another enticing method of preparing chillies for export is to bottle the long red variety in a solution of salt and water. This preserves the shape and colour of the fruit, and gives it a very attractive appearance.

The *Bulletin of the Botanical Department*, Jamaica, says on the subject of chillies :—

Pod peppers or capsicums, the fruits of *capsicum annuum* and allied species, are a well-known spice and condiment. They are an indispensable ingredient in curries, and are largely consumed in the fresh and dried state and in pickles. Some forms of capsicum known as Bell peppers are entirely free from the acrid and burning pungency so characteristic of these fruits, and may be eaten cooked as a vegetable or in salads.

Chillies, Bird or Guinea peppers, the fruits of the shrubby capsicum minimum (usual much smaller than the preceding) grow generally in tropical countries. These are in chief demand in commerce. When thoroughly dried and compounded, and afterwards passed through a hand-mill and sifted, they are the principal source of the well-known Cayenne pepper.

"It is estimated that about 100 tons of dried chillies are annually received into England from the West Indies and the East and West Coasts of Africa."

In the *Kew Bulletin* (1892, p. 18) the following information respecting chillies was given in an article on the agricultural resources of Zanzibar contributed by Sir John Kirk :—

"The small red peppers, or chillies, are largely grown in the more dry and rocky part of the Island, where the upheaved coal presents a honeycombed surface that favours the accumulation of rich soil in the crevices. The pods are picked when ripe, sun-dried, and packed in neat bags made of the split fronds of the Hyphæne palm for shipment. This is an industry that has sprung up within the last thirty years."

Zanzibar chillies, as they appear in the market in a dry state, are small, red, thin, carrot-shaped fruits about 1 inch in length.

The following further particulars are contained in a report on the spice and other cultivation of Zanzibar and Pemba (F. O. Report, 1892, Misc. Series, No. 226) :—

"The pepper plant growing in the Island is capsicum minimum, usually termed the "shrubby capsicum," and producing the bird's-eye chillies forming the basis of Cayenne pepper. This is to be found in a small degree in every shamba, but the principal source from which the annual exports are derived is the eastern side of Zanzibar, and the cultivation here is chiefly in the hands of the Wahadinu people.

"Judging from observations made during my brief visit to this portion of the Island, east of Dunga, the small isolated patches from half to 1 or 2 acres in extent, and combined with tobacco, tomato, pumpkins, etc., I regret my inability to quote the annual total exports, but I believe they are large, and an undoubted source of revenue. As the chillie is, as yet the only product of any value grown in this less favoured portion of the Island, I consider that this cultivation could be extended, and the returns are certain and profitable.

"Another variety of pepper (? capsicum annuum) bearing a larger red and yellow pod is also cultivated, but the produce from this is all consumed locally."

The latest account of Zanzibar chillies is contained in the report of Mr. Consul Cave on the trade and commerce of Zanzibar, for the year 1897 (Foreign Office, 1898, No. 2129, Annual Series) :—

"The production of chillies has risen from 16,336 frasilas in 1896 to 17,698 frasilas in 1897, an increase of 77,670 lbs. The average price was 2 dollars 37 cents per frasila, as against 2 dollars 57 cents per frasila during the previous year. A better price than this could doubtless be obtained for Zanzibar produce if a little more care and attention were devoted to its cultivation and harvesting, but up to the present time it has been allowed to grow almost wild on the coral outcrop which covers the eastern portion of the Island, and the slight personal discomfort which attends the handling of pods prevents the native from exercising any care in its picking and subsequent preparation for market. Attempts have lately been made to obtain a better sample on ground which has been specially cleared and prepared for the purpose, but the results are not yet to hand."

JAPANESE CHILLIES.

In a note on recent additions to the Museum of the Pharmacutical Society (Pharm. Journal, 11th December, 1897), Mr. E. M. Holmes, F.L.S., furnished the following interesting particulars, at an evening meeting of the Society, respecting Japanese and other chillies :—

"During the last three or four years there has been in commerce a very bright red variety of capsicum minimum, Roxb (C. Fastigiatum, Bl.), said to be imported from Japan. In consequence of its clean, bright, and attractive appearance, it has commanded a higher price than other varieties. Mr. J. C. Umney has recently directed my attention to the fact that this variety is less pungent than the Sierra Leone and Zanzibar varieties, although far superior to them in colour. On further inquiry, I find that this fact is well

known to drug and spice brokers. Mr. Umney points out that when an alcoholic tincture of either the Japanese or Zanzibar varieties is diluted with about 14 parts of water, the former gives a much clearer solution than the latter, indicating less oily matter. All the bright red Cayenne pepper until recently in commerce is said to have been imported from Natal in that state. The entire pod pepper imported from Natal is a variety of capsicum annuum, much larger than the chillies, and of a dark, red colour and very pungent, whereas the powdered Japanese and Natal Cayenne peppers, placed side by side, are indistinguishable in point of colour. The other principal varieties of chillies at present in English commerce are, I am informed, those of Sierra Leone and Zanzibar, the former being of a yellowish, red tint, and the latter of a dull, dark red, and often of inferior quality, containing badly dried fruits, stalks, and foreign matter, but both are more pungent than the Japanese kind. The latter is, however, quite pungent enough for most people, although perhaps unsuitable, by reason of its lesser pungency, for medicinal purposes, as an outward application, etc. I am indebted to Mr. Young, of the firm of Messrs. Dalton & Young, for information concerning the different commercial varieties. Nepaul Cayenne paper is made from a small variety of capsicum annuum, and is remarkable for its violet odour. Neither this kind nor the Zanzibar gives a red, but a brownish powder.

The following comments on Mr. Holmes's paper were made at the meeting by Mr. MacEwan :—

"The subject of Cayenne pepper was interesting to many chemists quite apart from medical purposes, probably more capsicum being sold for feeding birds than for any other purpose. The pepper used in that way was tasteless, and seemed to contain a large amount of fatty matter. It was dark in colour, and the object was to heighten the colour of the feathers. It was supposed to come from capsicum annuum, and he should much like to know where it came from. It was only supplied by two or three houses, and attempts by others to obtain it had not been very successful. There was no doubt that the pepper as used was an untreated product. The late Dr. Brady on his return from Japan, passing through Vienna, came across a comparatively tasteless pepper, which caused considerable discussion at the time, as there was a large amount of it on the market, but the substance had been pretty much lost sight of since. He thought it would well repay inquiry, as very little had been done on the subject of peppers since Dr. Thresh dealt with it about eighteen years ago."

According to a writer in Spons' *Encyclopedia*, Div. V., p. 1803 :—

"Several varieties of *capsicum annuum* have little or no pungency; one of these is abundantly grown in Hungary, forming the paprika of the Magyars. Another variety, cultivated in Spain, is imported into this country in powder for giving to canaries, to improve the colour of their feathers. The Nepal capsicums, which have an odour and flavour resembling orris-root, are the most esteemed as a condiment."

SOUTH AMERICAN PEPPERS.

The following interesting account of the use of peppers in South America appeared in the *Saturday Review* of the 15th September, 1886 :—

"*Aji-aji.*—Pepper of peppers is the meaning of this compound Quichuan word, and both word and thing are largely distributed over South America extending from the Bibo-Bio in the south to the Atrato in the north; it is also found in the dialects of the Gran Chaco; in Aymara, in Andaqui, among the agricultural Indians of Choco, the mining Indians of Potosi, and Cerro de Pasco. . . . .

"There are two kinds of aji; but there is only one way of preparing it. The best is that which is made from the greatest variety of peppers. The pods of these are taken when fresh, stripped of their seeds, and ground into a paste of the consistence of fresh spring butter. The paste is put into a small well-dried gourd, prepared on purpose, of the size and shape of a well-grown orange. The gourd, when thus charged, is then coated with a layer of well-tempered clay, and placed in the sun to dry or to ripen, as the simple people who prepare it say in their own tongue. By the time when the clay is well baked, the pulp or paste within has been dried into a fine yellow powder, and is then fit for use. Many people, ignorant of this fine art of the Incas, have supposed, quite naturally, that these aji-laden gourds, with their exquisite flavour and refined taste, were some uncommon and little known natural fruits. T other method of preparing aji is to grind the seeds with the poo which simply adds great pungency to the pepper, and is alwa used in the preparation of maize, or Indian corn, which is boiled its own husk with much aji, and surpasses in flavour and pleasan ness any vegetable curry of the East. The gourds of aji, whe thoroughly ripe, are cleansed of their coating of clay, tied up suitable leaves, well secured by the fibre of the aloe, and muc resemble when ready for market reeves of large onions, a doze gourds making up one reeve of aji. The cost of these in the goo old times was 1s. 3d. for a dozen gourds; what the price may now is only known on the exchange. Time was when some of th old families of the interior who had passed their lives in ignoran of railways, daily newspapers, and quotations of the state of th markets, had their own special way of preparing aji, mixing wit it some delicately scented bark ground to powder, or other salutar substance known only to the reticent Indian. From such house no visitor was allowed to take his departure without carryin with him a supply of the latest made aji; no traveller went the capital of any of the Coast towns, but he carried with hi some of this excellent pepper as a present to the Archbishop Bishop of the Diocese, the ladies of Santa Rosa, or the good Fathe who once a year went long journeys to baptise the chidren, marr their parents, and otherwise maintain the influence and authorit of the church in the remote parts of the earth. But even this goo custom is fast dying out."—*Kew Bulletin.*

DISTRICT ASSOCIATIONS.

CALCUTTA TEA TRADERS' ASSOCIATION.

The Annual Meeting of the Annual Meeting, Calcutta Te Traders' Association, was held on Monday the 3rd instan The Secretary having read the notice convening the meetin the Chairman (Mr. H. C. Begg) said :—

Gentlemen,—Mr. Lockhart-Smith, who so ably presided over th deliberations of your Committee for a period of two years, wa obliged to resign the chair as he was proceeding home. You Committee did me the honour of electing me to officiate for him fo the remainder of the season, and I have the pleasure, therefore, t move the adoption of the report for the year 1900 which is no before you. I think I may be at liberty to say that the report is record of useful work both carried out and in progress. The mai objects for which the Association was formed were the regulatio of the tea sale and the adjudication of claims between buyers an sellers. In neither of these directions have the duties of the Com mittee in the year under review been more arduous than heretofor which is matter for congratulation. True, it is stated in the repo that the list of claims is somewhat larger than that of last yea but the average value is less by over ten rupees per claim; and the thirty-three claims submitted, about one-fifth or 20 per cen were met without waiting for the decision of the Committe There can be little doubt, gentlemen, that the losses which gi rise to these claims are to a great extent due to the practice, whic I am afraid still prevails, of packing excessive quantities of t into the chests. Special attention of producer was drawn to th matter some years ago, but as there appears to be a tendency to r vert to the custom, your Committee deemed it advisable to ma another representation on the subject, and it is to be hoped th it will receive attention. Another matter which has claimed a goo deal of the Committee's attention is tea thefts. With so muc handling as tea is subjected to during its journey from the garde to the market, it is scarcely to be wondered that thefts occur, an that the greatest difficulty is experienced either in tracing them in providing measures to prevent their recurrence. A Speci Committee, as you are aware, has been appointed to enquire int the working of the Calcutta Port Trust, and while the matter *sub judice*, it would be out of place to discuss it at present. I ma say, however, as regards the Port Commissioners' Tea Wareho —in which we are chiefly interested – that it is receiving speci attention. One or two of your Committee acquainted with th management of the warehouse have given evidence before th Commissioner, and their recommendations are adopted, we ma do to see an improvement in the working of the wareho

d a diminution in the number of thefts of tea which are supposed occur there.

The proposal to remove the tea warehouse into the Docks, and to ilise the existing building for other purposes, did not meet ith your Committee's approval on the grounds stated in page 3 of e report. Their action, gentlemen, I have no doubt, has your pproval; and you will, doubtless, likewise endorse the objection ey raise to the practice which prevails of utilizing the building r purposes other than the storing of tea for sale on this market. I ink, gentlemen, that it is not necessary for me to say anything rther, and I would now ask if any gentleman has any comments make upon the report or other remarks to offer upon any subject hich might be of interest to the Association.

There being no response, the Chairman then proposed—

"That the report as presented be received and adopted, and that e audited accounts to December, 1900, be passed as correct."

his was seconded by Mr. J. D. West, and, on being put to the eeting, was carried unanimously.

NEW COMMITTEE.

The result of the voting for the Committee for 1901 was then eclared as follows :—

Sellers.—Messrs. Jardine, Skinner & Co., Messrs. Begg, Dunlop & o., and Messrs. Williamson, Magor & Co.

Buyers.—Messrs. Balmer, Lawrie & Co., Messrs. Finlay, Muir & o., and Messrs. Barlow & Co.

Brokers.—Messrs. J. Thomas & Co., Messrs. Carritt & Co., and Iessrs. Moran & Co.

There being no further business the meeting closed with the ustomary vote of thanks to the chair.

WYNAAD.

Proceedings of a General Meeting held at Meppadi Club, n Wednesday, 6th February, 1901. PRESENT :—Messrs. Abbott, Atzenwiler, Behr, Carver, Hockin, Lance, D. Mackenzie, Mackinlay, B. Malcolm, J. S. Malcolm, Nicolls, S. H. Powell (junior), Taylor, Trollope, Waddington, Winterbotham, and G. Romilly, *Honorary Secretary.* Mr. C. E. Abbot in the Chair.

Death of H. M. Queen Victoria, Empress of India.

Before proceeding to the business of the meeting, the Honorary Secretary read the following telegram addressed to the Viceroy by the Chairman, U. P. A. S. I., on behalf of the planters :—"This Association desires to convey "through your Excellency its heartfelt sorrow for irreparable loss sustained by the death of our beloved Queen and "respectfully to express deepest sympathy with the "Royal family in its bereavement."

1. Proceedings of last meeting were taken as read.
2. Mr. A. A. Carver was elected a member of the Association.
3. The accounts for 1900 were presented and passed.
4. **Import Duty on Tea in Ceylon.**—Read letter from Chairman, U. P. A. S. I.—The Honorary Secretary stated that he had received no acknowledgment of his letter from the Chairman of the Madras Chamber of Commerce, but that he had heard indirectly that the question would be discussed at their next meeting.
5. **Crisis in the Tea Industry.**—Read I. T. A. circulars, Nos. 5, 6, and 8, also considerable correspondence on the subject. After a long discussion, the following resolution was put and carried unanimously :—

"That, in the opinion of this Association, none of Mr. Rosling's "suggestions are practicable, that a general temporary abandon"ment of 10 per cent. of the present acreage in bearing would be "unfair in principle and impossible of accomplishment. We con"sider that the only true remedy for the present depressed con"dition of the Indian Tea Trade is to push the sale of Indian teas "in new markets, and, with this object in view, we cordially endorse "the action of the Indian Tea Association in asking the Govern"ment of India to impose an export tax of ½ pie per lb. on Indian "teas."

All the tea proprietors present signed the circular letter issued by the Indian Tea Association, asking for the imposition of this tax and stating the acreage of their tea under cultivation.

Mr. B. Malcolm suggested that part of the fund should be devoted to pushing the sale of Indian tea in India.

6. **Kulputty-Meppadi Footpath.**—The Honorary Secretary stated that Mr. Jacobi, the Taluk Board Overseer, had been to see him, by direction of the District Board Engineer, and said that Rs. 100 had been sanctioned to provide bridges capable of carrying a horse, and consulted with him as to the nature of the bridges required. It was decided that 4-feet wide bridges of jungle materials, with a bamboo rail, over the streams where the fords were impassable, would suffice.
7. **Fees levied for Service of Warrants in Mysore.**—Read letter, No. $\frac{\text{D-40}}{\text{M.O.}}$, dated 10th January, 1901, from Collector of Malabar, saying "I have the honour to inform you that the order, under which the fee was collected, has now been cancelled. No fee will be levied in such cases in future. The fees already collected will be refunded on application."
8. **Payment of Money Orders.**—The Honorary Secretary stated that he had had an interview with Mr. S. Devadasen, Inspector of Post Offices, Calicut Circle, who had promised that in future all money orders at outlying stations would be cashed within twenty-four hours of their receipt.
9. **Census.**—Read letter from the Collector of Malabar stating that the preliminary census will be postponed to the week before March 2nd.
10. **Differential Duties and the French Tariff.**—Read letters from various Chambers of Commerce in England and Australia to the U. P. A. S. I. on the subject.

Resolved that the Honorary Secretary write to the Chairman, U. P. A. S. I, asking him to again address the Government of India and to enquire if the enhanced French duties on Indian produce will come into force after June next, and if any steps are being taken to avert the serious injury to Indian interests, which would be caused by such an enhancement.

11. **Harbour on the West Coast.**—Read letter from the Secretary to the Government of Madras, Marine Department, enquiring at which port the Association wants a harbour to be provided.

Resolved that, as long as a harbour is provided, the Association considers the selection of the port should be left to Government experts.

12. **Gold Medal, Paris Exhibition.**—Resolved that this Association does not approve of the U. P. A. S. I. paying 600 francs for the purchase of a gold medal.
13. Read letter from Mr. J. Barboza, License-holder for emigrants to Natal, New Town, 3rd Street, Madras, offering to supply coolies.
14. **Tanjore District Board Debenture Loan.**—Read letter from the Deputy Collector of Wynaad circulating prospectus.
15. **Indian Gardening and Planting.**—Read letter from the Editor circulating copies of the paper for circulation. Recorded with thanks.
16. **Pepper Blights.**—Mr. Waddington called attention to the increase of a disease among pepper vines. The following gentlemen were asked to serve on a Committee to investigate the blight :—Messrs. Abbott, Nicolls, Powell (junior), Waddington, and Winterbotham.
17. The following papers were laid on the table :—

Madras Agricultural Department—		
Do.	Bulletin No. 40,	on the seed drill.
Do.	do. „ 41,	ground-nut crop.
Do.	do. „ 42,	native beliefs on hair-marks on horses and cattle.
Allahabad	do. „ 8,	on crops.
Do.	do. „ 9,	on wheat and maize.
Do.	do. „ 10,	wheat in rotation with leguminous crops.
Do.	do. „ 11,	ærmotor in well irrigation.
Do.	do. „ 7,	sugarcane disease.
Indian Tea Association	Proceedings 8th January.	
Do.	do.	Letter *re* Bounty on Green Teas.
Do.	do.	Circular No. 4, on prospects of Indian Tea in Russia.

Indian Tea Association, December statistics.
Central Travancore Planters' Association Annual Meeting.
Nilgiris Planters' Association Proceedings, 17th January.
Malabar Gazette notice *re* Sale of Occupancy right in Waste lands.

A vote of thanks to the Chair terminated the proceedings.

(Signed) C. E. Abbott,
Chairman.
(„) George Romilly,
Honorary Secretary.

THE BACILLUS AND THE LION.

"I am no more afraid of a boiled bacillus than I am of a well-cooked lion," says Dr. Alexander Hill, Master of Downing College, and Vice-Chancellor of Cambridge.

Now, the authorities affirm that out of 900,000 babies born annually in England and Wales, probably not more than one in twenty lives out his natural life; and the writer thinks that estimate is too high.

All the rest die—bar the few accidentally killed—from preventable diseases, such as measles, scarlet fever, small-pox, influenza, consumption, etc., a long and dreary list; all the maladies on it having a family likeness, and all arising from, and propagated by, germs. It is likely that one-third of the cows have tuberculosis, and, of course, people drink the disease in the milk.

It really does look as though it would be a good idea to boil the bacillus—as early in his career as possible. If necessary, we might cook the lions later on; they are comparatively harmless, anyway.

"To sum the matter up," says another man-with-eyes-in-his-head, "I have noticed that among the preventable diseases the greater number are due to mistakes in eating and drinking."

Which brings us to the little story that John K. Orthwein tells. "About three and a half years ago," he goes on to relate, "I was in the South Brisbane Fire Brigade service. At that time I contracted dyspepsia—a sharp and positive form of it, with the pains and penalties I had often read of, but never realised before.

"It lasted four months, and might have stuck to me as many years but for one thing. My appetite disappeared altogether, I got constant colds, and my attempts to eat were miserable spectacles for my friends to witness, and worse still as experiences for me. I used to belch up a sour, acrid fluid, and life was hardly worth the price of it.

"My comrades in the brigade knew the bad form I was in, and, one after another, they told me to try Mother Seigel's Syrup. They were nearly all in the habit of using it for anything that ailed them, and were sure it would set me to rights.

"Anything to get out of this, I said, and got the Syrup without delay. The first bottle did splendid work, and when I had finished the third, my digestive arrangements were sound as a gold sovereign, and have been ever since. I can eat whatever comes my way, and catch no more colds. And this I owe to Mother Seigel's Syrup. No wonder it is popular all over Australia.

"I am no longer in the brigade, but live at Hubert Street, Woolloongabba, South Brisbane, Queensland, where I shall be pleased to see anybody who wishes further details of my case."—John K. Orthwein, *October* 7th, 1899.

The accuracy of the above statement is vouched for in writing by Mr. R. Cumming, Assistant Superintendent, South Brisbane Fire Brigade.

We may kill the bacillus by boiling it, and we may cook a lion if we can catch him; but the only certain way to get rid of indigestion, and the black flock of ailments which arise from it, is by the use of Mother Seigel's Syrup.

MARKET REPORT.

[*Per Mail advices 25th January* 1901.]

COFFEE.

The London Commercial Record says:—There has been no improvement in the general tone of the market. Further small supplies of new crop Neilgherry have been brought forward and meeting with scarcely any competition were nearly all bought in, but privately sales to a moderate extent, chiefly smalls, have been made at steady rates. Jamaica of fine ordinary to low middling qualities have been in fair demand and sold at about previ prices. Colory Costa Rica and Central American descripti obtained high prices, but less desirable qualities were slow of The market for "futures" has been flat on continued large recei at the Brazils and lower Continental advices, and prices show decline of 1s 3d since our last. Yesterday's business includ March Santos at 31s, May at 31s to 31s 3d, July at 31s 6d to 7½d, September at 31s 10½d to 32s 1½d, and December at 32s 3d 32s 6d. Closing rates are:—

London ...	Santos ...	March delivery	... 31s 0d.
New York	... No. 7 Rio...	„	... 5·55 cent
Hamburg...	... Santos ...	„	... 31¼ pf.
Havre ...	... Santos ...	„	... 37½ fran

Auctions to-day comprised:—436 bags East India, 594 ba Nyasaland, 15 half-bales Mocha, 119 barrels 32 bags Jamai 300 bags Vera Paz, 280 bags Colombian, 1,587 bags Guatema 249 bags Mexican, 33 bags Peruvian, 12 bags Nicaragua, 96 ba Costa Rica, 65 bags washed and 2,296 bags unwashed Dumo Santos. The auctions went off flatly and a good quantity bought Mexicans fully is lower; other descriptions about unchanged.

Imports, Deliveries and Stock of Coffee in London, are as follows:—

	Stock.		Imports.	
	1901.	1900.	1901.	190
Tons ..	14,653	13,535	1,305	1,3
	Home Consumption.		Export.	
	1901.	1900.	1901.	190
Tons ...	1,083	1,218	563	1,36

The preceding figures exhibit—	Ton
the Imports a decrease this year of ...	2
Home Consumption an increase of	1
Export a decrease of	79
Stock an increase of	111

The following are the results of this week's auctions:—

East India.—Of 673 bags offered 280 bags old crop Coorg sol cherry medium to bold 41s 6d to 45s 6d, peaberry 48s 6d to 62s 6

Jamaica.—Of 21 barrels 103 bags offered 130 packages sol smalls 43s, good to fine ordinary 39s to 43s 6d, low middlin brownish colory 45s to 50s, peaberry 52s.

Nyassaland.—64 pags sold, pickings 27s to 40s.

Costa Rica.—200 bags sold, smalls 36s to 49s, low middling t middling 48s 6d to 57s, bold 61s 6d, good to fine colory bold 70s 6 to 84s, peaberry 59s to 76s.

Guatemala.—Of 1,419 bags offered 1,000 bags sold, smalls 35s 6 to 45s, low middling greenish 47s 6d to 48s, middling to goo middling blue 53s 6d to 56s, good bold blue 64s to 65s, peaberry 56 6d to 68s.

Salvador.—206 bags sold, smalls 34s, low middling 46s 6d to 47 good middling 54s, peaberry 50s.

Nicaragua.—Of 102 bags offered 10 bags sold, low middlin faded greenish 46s.

Colombian.—Of 565 bags catalogued 350 bags sold, low middlin to middling 43s to 49s 6d, bold 58s 6d to 59s 6d, peaberry 53s 6d country damaged, bold greenish 53s to 54s.

Mexican.—Of 1,823 bags offered 665 bags sold, smalls 39s to 43 low middling to middling 45s to 52s, good middling 54s 6d to 55 peaberry 48s to 62s.

Ecuador.—26 bags sold, good ordinary pale greenish 34s 6d.

nuary 24...	5·45	5·40	5·50	5·55	5·90

TEA.

CHINA.—Green teas continue to meet a good demand at full lues, Young Hyson realising in some cases more money, but ongous hang fire considerably. During the week 4,052 packages ve been offered at auction and partly sold as follow:—Moning d, Keemun 5½d, Formoso Oolong 5d to 10d, Scented Caper 4⅛d 6d, Ouchaine 3⅜d. Green tea:—Gunpowder 8½d to 1s 1½d, nperial 4d to 7¼, Foong Mee 9¼d to 11½d, Sow Mee 7d to 7½d, oung Hyson 4d to 8¼d, Hyson 3d to 6½d per lb.

INDIAN.—The usual Wednesday's sale was postponed until yester- y owing to the death of the Queen. During the week 51,300 ckages have been brought forward, compared with 52,900 ckages previously, and 56,400 packages at this period of 1900.

Common grades and thin liquoring descriptions were rather fficult to quit except at a slight concession. Useful invoices, owever, particularly those with improved flavour, (as in the case a few recent arrivals from Assam and Dooars), met better mpetition and quotations were as a rule higher, while fine and iest parcels being in request went firmly. Shipments from outh India for some time past have been disappointing in quality id prices in the majority of instances on a low level, but a nsignment from Kodanaad Estate possessing attractive cup ld well, 82 packages yielding 9¼d per lb.

For 45,000 packages on Estate Account 7d per lb. was obtained ntrasted with 8d per lb. for 48,300 packages, and 9¼d per lb. for 3,600 packages in the two preceding seasons.

CEYLON.—Auctions included 27,000 packages against 29,400 ckages on Tuesday before, and 35,500 packages a year ago.

Of the teas catalogued a fair proportion was again indifferent in haracter, and for these no material change was noticeable, though ot so many Pekoe Souchongs were obtainable under 4¼d per lb. n the other hand bidding was brisk for desirable lots, an ppreciable advance being often paid to secure the best.

The average is 7d per lb. On the 17th instant it stood at a ttle over 6½d per lb., and 7½d per lb. on the 25th January, 1900.

JAVA.—A slacker demand was apparent for most sorts and the 900 packages of direct import submitted to the trade received ss attention, a good many breaks being withdrawn in consequence low offers. About 1,500 packages are advertised for the st instant.

Deliveries.—Since the turn of the year these have been on a tisfactory scale, and although not equal to those of 1900, which ere exceptionally large in consequence of heavy payments made in nticipation of the rise in duty, they compare favourably with 1899. here is a fear in some quarters that the Chancellor of the Exche- uer may again select tea for incraosed taxation, which is no doubt ducing a few firms to forestall any such action.

Deliveries—The clearances of all Tea (on which duty has been aid) from the London warehouses, as per official returns are, *viz.*:—

From 1st to 24th January,	1901	...	...	16,82½,771 lbs.
Do. do.	1900	...	...	*21,121,353 „

During the week the following have been printed for sale by ublic auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India ...	... 45,870	5,425	51,295

52,042 *pkgs.* INDIAN
27,756 „ CEYLON
2.210 „ JAVA
} Total 82,008 packages were offered in public auction this week.

On account of the very low prices caused through over production, the importance of restricting the output of Tea in India and Ceylon is now generally recognised by Producers. A Joint Committee of the Indian and Ceylon Associations has been formed and their report issued.

A well attended meeting of members of the two Associations was held on Wednesday, when influential representatives of the principal Tea Producing Companies were present.

A resolution was unanimously passed adopting the Select Committee's Report restricting the output of Tea, and agreeing to recommend all producers to support the same;—the result of the meeting being telegraphed to Calcutta and Colombo.

QUANTITY OF TEA (IN LBS.) ON WHICH DUTY WAS PAID AT ALL BONDED WAREHOUSES IN THE KINGDOM FROM 1ST JAN. TO 31ST DEC.

Other Countries ...	825,510	711,868	1,179,173	967,574

INDIAN.—The better tone noticed last week has been further accentuated, and buyers have been purchasing decidedly more freely than for some time past. Useful liquoring Teas showed occasionally slight advances, while the decline in common grades appears at length to have been arrested. The following averages are worthy of note:—"Okayti T Co.," 1/6½; and "Sealkotee," 1/4¾.

Week's average of Tea sold on Garden Account 1901, 45,525 pkgs., av. 6·88d. 1900, 49,018 pkgs., av. 7·98d.

Total Tea sold on Garden Account 1st June 1900 to date, 897,828 pkgs., av. 7·48d. 1900, 905,328 pkgs. av. 8·42d.

CEYLON.—The animation which was noticeable in the bidding last week has been more pronounced, and the market has perceptibly hardened all round. All descriptions met with improved competition, slight advances taking place here and there even in common Teas, while better rates were paid for the higher grades. The following average may be mentioned:—"Carolina T. Co. Goatfell," 1/2¾.

Average for week 6·98d, against 7·44d in 1900.

Ceylon Tea sold on Garden Account 1st January to date, 89,713 pkgs., av. 6·75d. 1900, 111,276 pkgs., av. 7·70d.

JAVA.—The Teas sold rather slowly, and many lots were withdrawn from sale—offerings consisting mainly of low priced descriptions, which are not in such demand as better liquoring kinds,

Bank Rate 5 per cent. Exchange on London three months sight:—Calcutta 1/4 1/32. Colombo 1/4⅜.

COCOA.

Auctions on Tuesday presented 5,283 bags, of which 2,150 bags sold at again lower prices for Trinidad and Guayaquil, other growths being unchanged, with the exception of good and fine Ceylon which advanced a little. Of 1,001 bags Trinidad 440 bags sold at 1s decline on fine; 70s to 73s paid for fine to very fine, and 68s to 69s for middling to good. Of 538 bags Dominica 280 bags sold at 64s to 67s for common to good. 496 bags Grenada nearly all sold at steady rates—fine 67s 6d to 68s 6d, good ordinary to fair 65s 6d to 66s 6d. 210 bags Jamaica partly sold at 65s to 67s for common to good. 10 bags St. Lucia realised 64s 6d, and 13 bags St. Vincent 64s to 65s 6d. 13 bags fine Tobago brought 67s 6d. 11 bags Surinam sold at 68s. Of 1,738 bags Guayaquil 400 bags sold at easier prices—72s for Caraquez, 73s for Machala, and 75s to 77s for winter Arriba. Of 1,695 bags Ceylon 400 bags sold at full to rather higher prices for the finer qualities, and steady values for other grades; fine bold red realised 100s 6d, fair to good bold and medium 80s 6d to 90s 6d, middling 75s 6d, and smalls 54s to 66s 6d per cwt. Privately about 800 bags Trinidad sold at 67s 6d for middling to 70s for fine. 100 bags Grenada at auction rates. 100 bags Dominica at 65s to 66s, and 500 bags Guayaquil, fair Caraquez at 70s to 72s, and winter Arriba at 75s per cwt.

PEPPER.

BLACK.—Is very quiet on the spot, with small sales of Singapo at 6¼d to 9 5/16d. For arrival 125 tons Singapore sold at low prices—February-April (s.) at 6 1/32d to 6 5/16d, and March-May (s.) 6⅜d to 6 1/32d.

Nothing offered at auction on Thursday. To-day easier. 2 tons Singapore sold at 6 3/16d near at hand and at 6 5/16d down to 6 March-May shipment, closing buyers at 6 9/32d.

25 tons Tellicherry sold at 58s c.i.f. February-March (New Yor

WHITE.—Also slow of sale. Fair Singapore on the spot sold 9 5/16d, and fair Penang at 8 9/16d. To arrive no transactions reporte

Of 323 bags Singapore brought to the hammer on the 24 instant, only a few odd bags sold at 9d to 9⅛d per lb, for dull, t remainder being bought in at 9⅜d to 10½d, as in quality. 91 ba Penang taken out.

GINGER.

COCHIN.—Catalogues embraced 170 bags, of which 62 bags so (Mostly "without reserve") at a 29s for small and mediu brownish rough, part lean and shrivelled and slightly mouldy, a at 22s per cwt. for rough shrivelled D's.

JAMAICA.—Supplies of desirable quality are scarce and high prices are obtainable, but holders' ideas are now beyond t enhanced bids. 10 barrels offered were bought in at 55s to 62s p cwt., 56s being bid in vain for middling washed.

(AVERAGE FOR ALL INDIA 6·88d., JANUARY 25TH).

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 1st proximo. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

Munzerabad. *February 12th*, 1901.—*Crop*—Many estates are finished, and pruning is now in full swing instead. *Prospects for next year* are encouraging. *Health*—good. *Labour*—more than abundant. *Weather*—heavy East winds, and increasing temperature; the thermometer ranges from 62° to 73° in the shade. *Interesting item.*—The guns fired on Saturday by the Gowdas and villagers for the passing of the Queen, impressed the solemnity of the day on all.

Coorg. POLLI BETTA, 20*th Feb.* 1901.—*Weather*—Regret to have to report rain yesterday, which must have been heavy in parts of the country. It is likely to be followed by more rain to-day. Of course, it is entirely premature. *Crops*—Gleaning in hand. Pruning being pushed on with. Except that small-pox is prevalent, the general health is otherwise fair. Labour sufficient.

THE CEYLON TEA DUTY.

EVEN in progressive Ceylon there are men who still rely upon protection. It has been urged, for some years past, that the Import duty on Tea in that island should be abolished; but there are still many men who oppose this suggestion. From our contemporary, the *Ceylon Observer*, we learn that, among the Russian buyers, the feeling is very strongly in favour of the abolition of the duty. What they feel is that at present all blending for the Russian markets has to be done in Russian ports, or at Hongkong; the rent for space in the former places is so expensive that the business is costly and could be largely developed if blending were done here. It would be possible to erect large stores in Colombo for the

blending business, and, in addition to the quantities of China tea that would be taken on the abolition of the import duty, the quantity of Ceylon purchases would be greatly increased. This appears to go to the root of the whole matter. What is feared by some Ceylon men is that, by facilitating the blending of Ceylon tea with Indian and China leaf, they may bring about a *reduction* in the demand for their own product. The Russian buyers assert, on the other hand, that, if blending were possible at Colombo, Russia taking only 9 million lbs. of Ceylon tea, the amount purchased in the Colombo market for direct export would rise in all probability to something like 15 millions. Another point urged in favour of conducting the blending operations in Colombo is that the tea could be made up in packets ready for consumption and would suffer less injury than at present from the variable climate of the Russian ports in which the work was perforce carried on at present.

Now it seems to be beyond a doubt that, generally speaking, Ceylon tea is wanted in Russia for *blending* purposes. We might question if, all the world over, more is not used for blends than sold as pure Ceylon tea. But for the moment our concern is with the Russian market. There Ceylon tea is liked, but, say the chief Russian shippers at Colombo, chiefly for the excellent beverage produced when Ceylon and China teas are blended. Now it stands to reason that any course that will encourage the use of Ceylon leaf and the disuse of China tea must be to the advantage of the former; and if, by buying China tea, importing it into Ceylon and there blending it, dealers can bring about an increased demand for Ceylon teas in Russia, the planters in the island must be gainers. In the long run the planter is not concerned with the *name* under which his tea is sold. Whether it go on to the market as "Ceylon," "Pure Ceylon," or a blend, matters not to him. What he has to study is how to sell the whole of his produce, and how to get the best price possible for it. It has been evident of late that former fears as to the abolition of the duty causing an influx into Colombo of rubbishy China teas, to be exported as "Ceylon," need not be allowed to affect Ceylon's policy. She has shown that she can send forth rubbishy teas without drawing supplies from China, and the demand for low sorts in foreign markets is not so brisk as to encourage the making of special efforts to increase the supply.

Then there is the question of blends of Indian and Ceylon teas. Doubtless the abolition of the duty would benefit Travancore in particular, for it would enable the tea from that State to be put upon the Colombo market, where there is a varied demand. But Travancore's gain would involve no loss to Ceylon. Far from it. Our own view is that, if the Ceylon tea duty be abolished, and if the enterprising merchants of Colombo lay themselves out to develop the blending of Indian and China teas with those of Ceylon, the importance of Colombo, as a tea market, will increase at a rate that will astonish even Ceylon planters, men who are accustomed to seeing things fill out rapidly from very small beginnings. The advantages that Colombo offers, as a distributing centre, should not be lost sight of. If, to sell a pound of Colombo tea in certain markets, another pound (or more) of China leaf is required for blending purposes, let Colombo have the handling of that other pound, and get a small return for her trouble. A point that should not be lost sight of is the advantage of having the control. Blended in London, in Hongkong or elsewhere, tea may be put forward under any name the blender likes. Blended at Colombo, teas cou easily be sent forth only under designations that wou amply advertise the fact that they were mainly or partly Ceylon growth. In fact, Ceylon men would, in a manne have the nursing of the opposition; an advantage by n means to be despised in days of keen competition. We regr that the Planters' Association of Ceylon has not seen th matter in this light, and has expressed an opinion against th abolition of the duty.

TEA AND COFFEE IN THE UNITED STATES.

Comparing 1900 with 1899 there was a large increase i the imports of tea into the United States and a large falling o in imports of coffee. But the figures for the last decade sho that, as a matter of fact, coffee figures have been on th increase and tea figures on the decrease—a circumstance tha casts a doubt upon the efficacy of Ceylon and Indian planter efforts to convert the Americans to the cult of tea. Th figures are as follows :—

IMPORTS TEA.

Year ending June 30.	Net imports. Pounds.	Value. Dollars.	Av. import price, ℔ lb — Cents.	Per capita population Pounds.
1891 ...	82,395,924	13,639,785	17 0	1.29
1892 ...	81,610,741	14,267,411	16·0	1·37
1893 ...	88,131,088	13,651,800	16·0	1·32
1894 ...	91 801,565	13,857,893	15·1	1·34
1895 ...	96,437,042	13,029,868	13·5	1·38
1896 ...	93,340,248	12,585,741	13·5	1·31
1897 ...	112,907,548	14,737,062	13·1	1·55
1898 ...	67.697,295	9,608,530	14·2	0·91
1899 ...	72,834,816	9,523,313	13·1	0·96
1900 ...	84,843,491	10,557,741	12·4	1·09

Average, say, 87,000,000 last year.

IMPORTS COFFEE.

1891 ...	511,011,051	94,628,119	*19·0	7·99
1892 ...	629,671,748	126,395,317	*20·0	—
1893 ...	551,395,250	78,444,496	14·0	—
1894 ...	547,068,994	89,600,572	16·4	8·01
1895 ...	643,234,766	94.599,880	14·7	9·22
1896 ...	572,671,840	83,534,366	14·6	8·04
1897 ...	724,559,536	79,893.943	11·0	9·95
1898 ...	851,891,346	62,674,241	7·3	11·04
1899 ...	801,756,868	52,370,184	6·5	10·08
1900 ...	749,792.471	48,776,176	6 5	9·74

Average, say, 6,58,000,000 per year.

U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

Differential Duties.

Introducing the circular of the U. P. A. S. I. on this subject, the *Antigua Observer* remarks :—

It affords us much pleasure to publish the following circular from the "United Planters' Association of Southern India" on the subject of the necessity for the Imperial Government to adopt an Imperial Fiscal Federation for the protection of British interests as against those of the rest of the world.

The cry comes from the far east to the distant west and is echoed back with fervor: for our industries have been brought to the verge of extinction by the unfair Free trade enactments of the Home government which admits foreign bounty fed products on equal terms with the unassisted products of her own colonies and closed her doors to our trade—leaving us at the mercy of Foreign States: and further

* Overvalued by reason of depreciation in Brazil paper milreis.

using her colonies to buy the manufactures of foreign states hereas had our produce found sale in England our wants ould have been supplied in exchange.

With the exception of a small quantity of Pine Apples *ne* of our produce goes to England.

Were it the case that England is entirely dependent on reign grown raw stuffs for her manufactures, or for food-uffs, the reason would be strongly in evidence for the course ursued; but her colonies encircling the world and producing very possible want of hers, makes her thoroughly independ-nt of other nations, both for imports and exports.

Foreign markets are barred against British produce by igh tariffs while the English market is open to them to the isadvantage of British interests.

There is scarcely a limit to the supplies that can be obtained rom British dependencies whether raw material for manufac-uring or for food, for there is land enough for cultivation and o increasing their exports.

NOTES.

he British Tea Duty.

A special cablegram, dated 15th instant, to the *Times of Ceylon* says :—The market is demoralised. Trade money is locked up in peculative duty clearances.

Ceylon Tea not paying its Cost."

The *Morning Herald*, of 25th ultimo, says :—Mr. W. Martin Leake, the Secretary of the Ceylon Association n London, in conversation with a *Leader* representative esterday, said that at the present time Ceylon tea was not aying its cost.

olombo Tea Sale.

The *Times of Ceylon* of 13th instant remarks :—In view of telegrams eceived from London, which report a very depressed and dragging market, the local market must be considered to have passed off with a steady tone, at fully previous rates for all desirable sorts. Quality is generally very fair, although some nvoices are not equal to what they have been.

The Tea Problem and Indian Opinion.

A telegram, dated Calcutta, February 14th, to the *Times of Ceylon*, says :—The consensus of opinion of those engaged in the tea industry favour restriction—on the condition that all accept the report of the Joint Committee in London—on the basis of reduction of acreage plucked. Many prefer the alternative of finer plucking. These two proposals will probably form a basis for united action.

The Assam Labour Bill.

The Surma Valley planters were to meet in Silchar on Monday to protest against the wages scale proposed by the new Labour Bill. Every one's idea is that had the proposed wage been given twenty years ago there might have been some excuse for it, but now that food, clothing, etc., are so cheap the proposed increase is a wanton piece of interference, calculated to seriously injure an industry which is already sufficiently down on its luck and more in need of every assistance Government can give.

The Colombo Tea Traders' Association.

The *Times of Ceylon* remarks :—It has been found that, with the growing size of the local sales of tea, that closing the catalogues at 2 p.m. on Saturday, does not allow of their being printed and circulated, together with samples, soon enough for sampling to take place without a great tax upon tasters owing to insufficient time. Hence the notice advertised to-day for the annual general meeting of the above Association on Friday next. It is also to be proposed that auctions commence at 11 a.m.

East African Tea.

The *Zanzibar and East Africa Gazette*, January 16th, says :—A small packet of tea was last week sent in from Dunga, the first fruits of the tea garden that was laid out there two years ago. The tea had a slightly new and unripened smell and taste, but otherwise compared favourably with the ordinary article, especially as regards strength. We are informed that it was manufactured with such appliances as were to hand : rolled on a deal table, sun-dried, and fired with an ordinary charcoal stove. We believe this to be the first tea made in East Africa.

Calcutta Tea Sales.

Calcutta news states that at the sale held on 16th instant, after an intermission of ten days, 13,000 packages were dealt with. A few Assam invoices of fair quality were offered ; but the sale largely consisted of red, stalky kinds. Prices were lower for all except the best ; but for a considerable business for various outside markets, it would have been difficult to quit all offerings. Calcutta sellers are not yet able to realize what London values have declined to. Reuter cabled a record for the week, but there is a feeling that the worst has yet to come. One further small sale will close the season.

Cinchona Bark and Quinine in 1900.

There is no doubt, says the New York *Drug Reporter*, of January 14th, that the influence of Java quinine on the market was felt more during the last six months than ever before, and from present indications it will continue to be a factor of considerable importance in the situation if the price continues to rule as much below the well known brands as it does to-day. Early in the year it was difficult to dispose of the larger part of the offerings at the Java auctions, but at the auction held on December 28th all the offerings were reported sold, and at a figure above the views of buyers in this market.

The New York Coffee Exchange.

The annual meeting of the New York Coffee Exchange was held on January 10. The report of the Treasurer, for the year ending December 31, 1900, showed current receipts of $15,645·18, including $12,480 dues from members. Current disbursements were $20,499·97. During the year $5,000 was paid on account of loan on the Exchange building. The total assets of the Exchange over liabilities are $188,378·18. The gross rentals from offices in the Exchange building during the year were $46,857·34. Operating expenses of the building, including agents' commissions, were $22,790·54.

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nicholson's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf people, unable to procure the Ear Drums, may have them free.

Address—No. 989 D, THE NICHOLSON INSTITUTE, Longcott, Gunnersbury, *London*.

[w. 26-5-00—26-5-1901.]

"Sad, but True: starved out" of Good Ceylon Teas.

A well-known Glasgow tea-dealer writes under date, January 18th, with this heading for his text :—"For 11 years we have been importing medium, good, and high-class teas. During the last five months we have had only three parcels that would come within this category ; and we are advised from Colombo that, in the case of the latter, they are not to be had, except at from 1½d. to 2d. per lb. over their selling value in London, but in many sales not to be had at all. Until recently we had dealers regularly looking in to see if we had any samples by the mail, but those days are gone. Nothing to be had now but poor characterless teas."

China Tea.

The total export of tea from all China during the first four months of season 1899-1900 and 1900-01, was as follows :—

	1900–01—Lbs.	1899–1900—Lbs.
To England	18,010,104	24,286,761
To the Continent ...	10,092,132	7,180,138
To Russia	30,531,666	28,022.655
To America	41,430,157	30.340,243
To Australia	6,251,538	6,094,660
To South Africa ...	1,300,864	1,120,961
Total ...	107,616,461	97,045,428

China thus exported 10,571,033 pounds more tea during the first four months of her season this year than during the corresponding period last year.

Doctored Coffee.

The Dairy and Food Commissioner of Ohio issued a notice on January 1, 1901, that on and after thirty days from date, the statute (Bates' R. S., Sec. 4200—6) against the practice of adulterating coffee by manipulation, such as coloring, coating, polishing, or powdering, whereby damage and inferiority is concealed, or whereby it is made to appear better and of greater value than it really is, would be strictly enforced. The following is the law on the subject (Bates' R. S., Sec. 4200—6, paragraph 6) : "(6). If it is colored, coated, polished, or powdered, whereby damage or inferiority is concealed, or if by any means it is made to appear better or of greater value than it really is." The Department holds that it is not a compliance with the foregoing to simply label the article "Compound" when coffees are filled, coated, and glazed to make them appear better or of greater value than they really are, and to retain water that has been added to increase weight. Additional information will be furnished on request.

Tea.

Messrs. Francis H. Leggett & Co., of New York, have issued a *brochure* of which the *American Grocer* writes :—This is a beautiful *brochure*, $4\frac{5}{8} \times \frac{3}{8}$ inches, in dark green cover with designs in gold. The frontispiece is a dainty reproduction in colour of a branch of the tea plant in blossom, and also showing the seed. The first chapters deal with the history of the world's most famous leaf. Included therein is a reproduction of Thomas Garway's famous circular, printed about the middle of the seventeenth century, and which, the author declares, "embodies the redundancy of a modern legal document with the pretentious ignorance and hifalutan language of the so-called medical treatises of to-day." In verbiage it savors of the school of Usufruct Tilden, and in its statement of the more modern school of dietetical philosophers who find virtues in baked cereals, when used as a beverage, equal to those t ancients claimed for sage tea. Tea picking, the manufact of the leaf, and the American industry form the subject other chapters. Consideration is given to the bearing of upon social life, and, in addition, several poetical effusions the leaf and its seductive qualities.

The Tanjore Railway Loan.

The following is the result of allotment of the Rs.20,00,000, Tanjore District Board 4 per ce Railway Debenture Loan of 1901, lately advertised in Prospectus of the President, dated 8th November, 1900 :—

Aggregate amount of Tenders ..	Rs. 9,42,500	Cash	Rs. 4,40,000
		Pro-notes	,, 5,02,500
Minimum rate of accepted Tenders.	,, 94-9-0		
Tenders at that rate received per cent.	,, Full.		
Total amount of accepted Tenders..	,, 6,17,000	Cash	Rs. 2,55,000
		Pro-notes	,, 3,62,000
Total amount to be received ...	Rs. 5,87,520	Cash Rs. 2,45,204	Rs. 2,45,
		Pro-notes face value, Rs. 3,62,000	
		At Rs. 94-9-0, closing rate of yesterday	Rs. 3,42,
		Rs. 6,07,204	Rs. 5,87,
Average rate at which Loan is issued	Rs. 95-3-7		

Coffee in London.

The *Produce Markets' Review* 26th ultimo, says :—The auctio have been only scantily supplied, and mostly with old cr Guatemala and Mexican, importers apparently wanting clear out their old stocks before the new arrives. To effe sales, somewhat lower prices have had to be accepted, thoug the decline does not amount to more than 1s. to 1s. 6d. p cwt. The knowledge that there was a moderately larg quantity of these coffees being held back has had a depressin effect on the market for some time, but in another few week when it is expected the balance will at least have been offere if not sold, some relief may be looked for. The few lots new Costa Rica sold quite up to recent values, and fine bol parcels fetched higher rates. The East India continue unsatisfactory, both from a home and export trade point view, and here again the weight of old crop remaining check any desire to increase stocks, and will do so until some reall fine parcels arrive. In the terminal market the receipts hav again proved beyond all expectation, and quotations hav accordingly declined from 1s. 6d. to 2s.. but the closing price are not quite the worst.

Indian Tea Report.

Messrs. Maccaughey's Tea Repo of the 31st ultimo, states that th week has shown a record as regards the quantity, the tota with Ceylons, being just under 100,000 packages. The trad could not stand such heavy offerings coming on the top the enormous call for money for extra duty payments, an prices of common tea must be quoted down again. Thursday quotations were noticeably weaker, with 3½d. per pound fo clean leaf and a fair amount at 4d. The impossibility giving proper attention to large quantities printed for Monda also had a depressing effect. The promise of a better marke is, therefore, not maintained and common grades lost mo than had been gained last week. Assams, when desirabl sold fairly well, and where Duars showed distinct improve ment, as in the case of Bamandanga and some other division

the Duars Company, there was good competition. Sylhet, andpur, and a few others sold well, but the quality, taken round, was very disappointing, and the averages were y low. All kinds of fannings and poor Broken Pekoes nain very cheap, and even in the case of the better class of oken Pekoes up to 1s. 1d. per pound, it was often difficult get near the valuations.

lian Teas in London.

The *Produce Markets' Review* of January 26, 1901, reports :—There is decidedly improved demand, and a large business has been ansacted at steady to firmer prices. The better medium scriptions have been actively competed for, and in many ses enhanced prices have been paid, the market closing ong with a good inquiry. These teas have for some time st offered exceptional value, and at the moderate advance ey are still worth the attention of the trade as a steadily creasing business is quite probable, and buyers will do well hold a larger working stock than usual, more particularly this class. The lower kinds have been freely bought, hich is mainly attributable to the teas from many of the rdens, particularly Sylhet and Dooars, showing better ality, and it is quite likely that clean sweet tea will not be tainable at lower prices. Should the reports from Calcutta, wever, be confirmed there will be a considerable quantity very inferior tea later on which will probably be offered lower quotations. There is but a comparatively small pply of the higher class sorts and consequently with an tive inquiry better prices have been paid. The public sales mprised 51,924 packages, all useful descriptions, which met ith a brisk demand and sold at somewhat firmer rates.

offee without Caffeine.

At a recent meeting of the Paris Academy of Sciences an interesting aper was read by M. Duclaux on "The Chemical Composion of a Coffee of the Grande Comore," the result of experients by M. Gabriel Bertrand, of the Pasteur Institute. It ppears, says the *Chemist & Druggist*, that this coffee grows a wild state in an island off the coast of Africa, where it as found by the explorer Humblot, and is signalised on ccount of the peculiar fact that it does not contain the slightst trace of caffeine, to which ordinary coffee owes its excitant roperties. One quality of this coffee is, therefore, that it an be taken as an after-dinner beverage at night without ny fear of insomnia. Referring to it from a scientific point f view, M. Bertrand drew attention to the fact that well-nown botanists, such as Professor Frœhner of Berlin, and Professor Baillon of Paris, have not been able to agree as to he specific nature of this coffee. The French botanist holds hat it belongs simply to the same species as ordinary coffee, *Coffea arabica*, while his German colleague treats it as a new pecies, and gives it the name of *Coffea humblotiana*. As a natter of fact, the botanical characteristics are practically dentical with ordinary coffee, but there is a distinct difference n the chemical composition. This is not apparently due to ny difference of soil or climate, as an analysis of *Coffea rabica* cultivated on the island shows it to contain 13 grammes of caffeine per kilo. M. Bertrand is of opinion the subject pens a new field of study to biologists.

London Tea Sales.

The London market goes from bad to worse. Messrs. Gow, Wilson & Stanton's cable of 14th instant, to Colombo records a further decline. Average 6d. (½d. down). Reuter reports that 21,000 packages Ceylons were sold out of 32,000 offered, and 34,000 Indians out of 56,000 offered. Average price of Indians remained unchanged, 6½d. The *Times of Ceylon* remarks :—"Ceylon Tea in London has fallen to a point which has been predicted from time to time by those pessimistically inclined, but whose forebodings have been received with incredulity by most of those interested in the price of tea. If proofs were wanted that we have overloaded the London market, Reuter's figures to-day give clear evidence that "tea for price" is not wanted at any price at home. For of 32,000 packages offered only 21,000 sold, even when Pekoe Souchong is quoted at 4d. by Reuter, and 4½d. by Messrs. Gow, Wilson & Stanton. The annals of the tea industry record no such average price as that of this week, and we add the prices for the same week for the past five years which are instructive as to the amount the rush for quantity has cost Ceylon tea planters :—

	d.
1901	6
1900	7⅜
1899	8½
1898	7½
1897	8
1896	8¼

If we have to give away our tea at less than cost, planters, we feel sure, would prefer that merchants who are handling our tea in Australia, Russia, Canada, and elsewhere, should have their share of the good things that are going, instead of the London middleman, gorged to such repletion that he will take no more, adding to the profits he has lately had thrust upon him. It would have been better for Colombo, and better for the tea industry generally, if the "fall back" upon London when prices gave way here two months ago had not been so quickly resorted to, with the result that the sterling tea average of to-day places so painfully before us."

GENERAL ARTICLES.

THE PLANTERS' ASSOCIATION OF CEYLON.

THE ANNUAL MEETING.

There was a large assembly of planters from various parts of Ceylon at Kandy on the 15th instant, in readiness for the Annual Meeting, which was opened the following day.

On the 15th three important sub-Committee meetings were held, when all questions concerning the Tea Problem were thoroughly threshed out.

A sub-Committee met to discuss the official estimate of crop for the ensuing year; and another sub-Committee met to consider the Over-production question; and a general meeting of Chairmen of District Associations was also held.

THE ESTIMATE FOR THE COMING YEAR.

On the 16th a General Committee meeting was held, when it was decided to delete altogether the paragraph in the report referring to the tea crop estimate for the coming year. The figures arrived at by the Committee were 146,000,000 lbs., of which it was estimated that 105,000,000 lbs. would be sent to London, as compared with 114,000,000 lbs. last year. The total estimate was thought to be too small, and another estimate is to be made.

THE GENERAL COMMITTEE'S RECOMMENDATION REGARDING OVER-PRODUCTION: TO REST 10 PER CENT. OF THE CULTIVATED AREA.

With regard to the Over-production question, this was discussed by the General Committee on the 16th, when it was resolved to recommend to the Association that ten per cent. of the area in cultivation be allowed to rest, and that a sub-Committee be appointed to ascertain what proportion of the estates would adopt the scheme.

The annual report was taken as read. The following are extracts.

FORTY-SEVENTH ANNUAL REPORT.

After the announcement that the register of estates and voters stand at 918, the first paragraph on the all-important subject of

TEA

is as follows:—

Last year was an abnormally wet season over a large number of the tea planting districts, but the weather generally was favourable for heavy flushing, with the result that shipments are approximately 10,000,000 lbs. ahead of the estimate, and 18,000,000 more than were shipped in 1899. This heavy increase, combined with the low quality and heavy shipments from India, have resulted in a lower average price than has heretofore been seen. Your Committee feels that unless these heavy annual increases in Ceylon shipments as well as those from Calcutta are checked, only still lower prices can be expected. The chief feature in the history of the tea trade during the past year was the raising of the British Import Duty from 4d. to 6d. per lb. with the result, as it would appear, of checking increase in the consumption. Foreign markets have received continued and greater attention, and considerably larger quanties of Ceylon tea have been shipped to other countries than the United Kingdom; nevertheless some 23,000,000 lbs. Indian and Ceylon teas have been produced during the past year in excess of all requirements. Adverting to the trade dispute of 1899, the compromise agreed to, *viz.*, the taring to lb., half-pound, would appear to be working fairly satisfactory, there being little loss in weight to complain of beyond 1 lb. allowed as draft, whereas previously the extra loss frequently reached from ½ to 1 per cent. Warehouse charges have met with a small reduction which your Committee trusts is merely an instalment of what will come, as the present reduction is quite inadequate.

Home consumption statistics for 1900 follow; while regarding the subject of duty, which is again attracting special attention in London, the following reference occurs, succeeded by an advocacy to pluck finer:—

Duty in December, 1900, was paid upon 16,302,079 lbs. of tea, against 15,615,802 lbs. during December, 1899. This is the first instance since the declaration of the Budget in March last that the *duty payments* have shown an increase over the corresponding period of the previous year. It is, therefore, possible that the large quantity of tea cleared in anticipation of the Budget may now be nearly worked off, and that figures may shortly assume their normal condition.

There is a strong feeling amongst some of the larger Indian and Ceylon tea producers, that in view of the over-supplied condition of the market, it would be advantageous to resort to finer plucking during the coming season, with the double object of reducing the supply and improving the quality of the crop.

TEA BLIGHTS.

During the past year blights on tea received the most careful attention of planters aided by the scientific experts at Peradeniya, Messrs. Carruthers and Green. There is not the same anxiety felt regarding insect pests and fungoid blights as there was about 18 months ago—for the condition of tea bushes all over the tea districts is satisfactory as regards appearance while as regards production, the increased export of tea—much exceeding the most sanguine estimate—speaks for itself. In this connection Mr. Kelway Bamber is experimenting with a view to increase the ability of the bushes to produce teas of better flavour and strength rather than increased quantity by employing manures which will be specially adapted to raising the former standard and thus probably enable the trees to withstand the effects of both insects and fungoid attacks.

COCOA.

The crop for the year 1900 was 33,697 cwts. against 42,527 cwts. for 1899. The serious falling off is due in the first place to the failure of the usual rains for the first 5½ months of the year, whereby the Spring crop was in a great measure lost, and the usual May and June blossoms failed to appear; and secondly to cocoa disease, which has caused the temporary loss of many trees in various estates and latterly the blackening off of pods. Disease among the red cocoa is, undoubtedly, serious and when neglected must end in disaster, but it has come within the personal knowledge of several experienced planters and of Mr. Carruthers that where proper precautions have been vigorously carried out, a very decided improvement as regards disease is distinctly noticeable in quite a number of estates, when compared with their condition two or three years ago. Cocoa stealing continues. The village headmen system if properly worked, is an ideal one for the suppression of this nat of crime.

CARDAMOMS.

The area now under this cultivation so largely exceeds tha any former year that it is the opinion of many growers that ca moms will, for a time, cease to be so remunerative, whilst oth maintain that the few thousands of pounds which Ceylon is cap of producing will not affect the market. Although the cultiva is being greatly extended in North Travancore, it is believed t there is a local market for all the land there can produce. exports during the year were 537,455 lbs. compared with 499,959 in 1899, crops generally have been short of estimates and many the older fields gave 50 per cent. less than their usual crops.

RUBBER.

During the past year little progress had been made in the pla ing of this product, scarcely any demand existing for seed exc the Castilloa variety. It may be of interest to note that one gr of estates in the Dumbera district exported 6,000 lbs. of Ce Rubber, which sold for at an average of close on 3s. for lb.

PARA RUBBER.

A demand for seed still continues for the Straits and Borneo well as locally though on a reduced scale as compared with previ years. With very few exceptions all rubber planted in Ceylon either throughout the tea or round the edges of swamps and on banks of streams. In regard to tapping there is still a great d to be learned, but it would appear from experiments that 1 lb. dry rubber per tree from 10-year old trees should (and if tap hard considerably more is obtainable) be a safe estimate and cos harvesting should not be more than 50 cents per lb. Present valu are about 3s. 6d. for best quality and 2s. for scrap.

COFFEE.

For some years no reference has been made to coffee, and reason is plain inasmuch as the exports of coffee for the year end 31st December, 1900, aggregate only cwts. 9,396.

After mention of the total exports of produce given in the append and the Customs' duty upon Colonial produce entering France fr countries which do not enjoy most-favoured nation treatment, t report proceeds:—

GOVERNMENT AGRICULTURAL DEPARTMENT.

This department of Government, so important in a Colony li Ceylon which depends for its prosperity mainly (it might be sa entirely) on Agriculture, has been inaugurated, and three ch officers have been appointed to meet the views of your Associati

THE BRITISH TEA DUTY.

Reduction of telegram charges between the United Kingdom a the East is dealt with; and then the recent resolutions on the r duction of the British tea duty. These resolutions having be duly transmitted to Government, it has been intimated that forwarding to the Secretary of State for the Colonies the s resolution passed by your Association urging on Her Majest Government a reduction of the Import Duty on tea in Gre Britain, His Excellency the Governor will give all the suppo he can.

THE CLOSING PARAGRAPH.

The past year has been one of more or less unrest everywhe with reduced dividends generally in connection with the Tea ente prise, and other Agricultural industry, while the effects of Wa Pestilence, and Famine elsewhere have been reflected and fe locally, both publicly and privately. The new year of your Asso ation beginning to-day will be memorable as the first of a Ne Century in the History of the World, while a retrospect of tim past warrants confidence in continued future welfare for Ceyl and its Agricultural enterprise, whatever developments or chang conditions occur in connection with your staple tea. Under circumstances your Committee commends again to the consta notice of all members and others with a view to practical acti and combinations, the motto *Unitas Salus Nostra.*

The Chairman, in moving the adoption of the report, reviewe the work of the past year. He said the present position of the T Trade demanded the closest attention. The price paid for the product had fallen to a lower level than had hitherto been reache and unless some relief could be afforded in the more or less i mediate future the proprietors of the poorer class of property mu be ruined. As regarded the estimate for the current year, th Committee felt it advisable, in view of the proposed reduction output, to call for a revised estimate before making public tho that had reached them. He pointed out, however, that everythi

led to show a marked decrease in exports to the United Kingdom ing the current year. He thought they might reasonably con-tulate themselves on the result of the one Pound Draft dispute. vernment had been approached, but were unable to agree to a re-tion of Railway Rates, and a motion on this subject would be ught forward by the Hon. Mr. J. N. Campbell. Labour appeared have been plentiful throughout the greater portion of the erent districts. The Benevolent Fund had continued to receive l-merited support at the hands of certain members of their com-nity, but he would like to see that support largely increased, as l as greater support given to the Hatton Nurses' Home. Con-ning the Ceylon Contingent, he feared that, as the war dragged so wearily, the glamour and novelty had worn off, and that they re apt not to remember so vividly their brothers at the front. If ssible they should send a Relief Contingent in order to let those o had been in South Africa one year return. The Rifle Corps vement had proved distinctly successful, thanks to the energy d zeal of the Hon. Mr J. N. Campbell. Regarding the work of e "Thirty Committee," he maintained that the American market s one to which they must look to take both black and green s. As to the work on the Continent, they had been kept fully vised. The green tea market required time for development d no present relief could be expected from this source.

RE-ELECTION OF MR. ROSLING AS CHAIRMAN.

Mr. W. D. Gibbon then temporarily occupied the chair, and, in eulo-stic terms, proposed the re-election of Mr. Rosling as Chairman. The motion was unanimously carried.

THE SECRETARY RE-ELECTED.

The Hon. Mr. J. N. Campbell moved the re-election of Mr. A. ilip as Secretary, referring to his long and faithful service to the ssociation.

The Chairman seconded, and the motion was carried amid applause.

OVER-PRODUCTION—THE CHAIRMAN'S MOTION CARRIED.

Mr. Rosling added as a rider to his motion the following recom-endations that had been made by the sub-Committee:—(1) "That combination with India, having for its object the reduction of tput, is desirable"; (2) "The sub-Committee considers that the ly scheme practicable is an all-round reduction of the plucking ea by ten per cent., conditional on eighty per cent. of the cultivat-tea acreage joining in the combination and upon India joining the same terms. If any proprietor prefers to make ten per nt. of his tea crop into green tea, this shall be accepted in lieu of duction of his plucking area by ten per cent"; (3) "That a b-Committee be appointed to obtain adherence to the scheme." r. Rosling's original motion was as follows:—"That action be ken by this Association with a view to form a combination nongst Indian and Ceylon Planters, to cope with the present nsatisfactory condition of the Tea Market, consequent on over-roduction."

The Chairman carefully weighed the *pros.* and *cons.*, of the heme, and observed that if the time was not now ripe for com-ination it never would be.

Mr. Sholto Skrine seconded Mr. Rosling's motion, remarking that ey had the satisfaction of knowing that their great rival—India—as pushed into an even closer corner than Ceylon. That being e case, they had the opportunity of forming a combination so as put tea produce on a reasonable footing in the markets of the orld.

Mr. J. H. Martin criticised the Chairman's motion on the ground at although 10 per cent. of the acreage would be rested, there was o guarantee that manure would not be applied to the balance of he acreage and it did not prohibit the opening of new clearings.

An amendment was moved by Mr. A. H. Thomas to the effect hat the cess be increased by one-half, but it was not seconded.

The discussion was continued by Mr. James Sinclair, who sug-ested the appointment of a Committee to confer with India and ork out the scheme; Mr. James Ryan and Mr. Labouchere Hillyer.

The Chairman replied to the criticisms, and the motion was even-ually carried almost unanimously.

The Chairman announced that the resolution would be telegraphed o Calcutta and London.

MR. TURNER'S MOTION REJECTED.

Mr. Turner's motion—"That, in the opinion of this Association, he time has arrived to approach the Government of Ceylon, asking or—(1) the abolition of the Import Duty on tea in Ceylon; (2) the appointment of Inspectors to guard against the Export and Import of Rubbishy teas," was, with slight verbal alteration, rejected the abolition of the Import Duty being strongly opposed by Messrs. A. H. Thomas, Sholto Skrine, C. Gibbon, the Hon'ble Mr. J. N. Campbell and others.

GOVERNMENT'S CONTRIBUTION TO THE TEA CESS FUND.

The motion of Mr. James Westland—"That Government be asked to contribute from Surplus Revenue to the Tea Cess Fund a similar sum to the amount collected last year," was also unanimously agreed to.

THIRTY COMMITTEE.

The following are extracts from the Report of the "Thirty Committee" for the year 1900:—

Finances.—The total collections paid into the Ceylon Tea (New Markets) Fund on account of the Export Duty on tea from January to 31st December, 1900, amount to R294,140·00. The balance in the Bank, brought forward from 1899, was R131,240·96.

Ceylon Tea in America.—A sum of £10,000 stg. was voted for disbursement by Mr. Wm. Mackenzie in pushing and making known Ceylon tea in America during 1900, and amounts aggregating £9,500 were remitted up to 31st December, 1900.

"As usual at the end of the year, I send a report upon our work in America. The methods pursued have been identical with those of former years, and are well known to the Committee. They are chiefly newspaper advertising, subsidies to advertisers, demonstrations, leaflets, sampling, etc. During the early half of the year our teas made fair progress in the States, and seeing how the whole tea industry was crippled by an excessive duty and very cheap coffee, we had little cause of complaint. But circumstances changed rapidly in the latter half. Large quantities of black China Congous poured into the States, prices fell several cents, and importers were disheartened. The English firms found themselves unable to dispose of Ceylon teas imported in June and July, except at ruinous losses. Then since October, the downward tendency has been so persistent in the kinds of tea America chiefly takes, that everyone was afraid to import knowing that however favourably bought one week, his teas could be undersold at next week's prices. When bottom has been touched, perhaps confidence may be restored, and orders may come forward. But as regards the States, we have to face the fact that the black China teas we have been for years trying to displace, are there in large volume. The reason generally ascribed for the immense importation of those teas is, the trouble in China. Merchants fearing the war would spread south, and hoping to get an advantage over rivals, ordered large quantities early in the season. To their surprise and disappointment, all of them got all they ordered, and the result is an over-supply. In Canada the situation is different. The figures for imports of teas are made up for 12 months to 30th June each year. As officially issued they are as follows:—

	To 30th June, 1898.	30th June, 1899.
Ceylon ...	3,406,000	6,857,000
Indians ...	2,032,000	4,643,000
Japans ...	9,260,000	9,294,000
China, etc. ..	5,329,000	4,077,000

This table shows the vast stride Ceylon and Indian teas made in the period—July, 1898 to June, 1899. Japans were steady during both years, and although British-grown teas bulked more largely during the last year, taking the two years together, Japans were 18,500,000 against British teas 17,000,000 lbs Since July, either imports of Japans have been small, or consumption has been very large, as there has been a great scarcity of these teas in Canada, and the price has gone up very considerably. The latest market reports from Quebec, Montreal, and Toronto predict a still greater stringency in the Japan tea trade in Canada, before arrival of the next crop. This condition of the Green tea supply should afford us a good opportunity for introducing *Ceylon Greens.* What is being done by way of shipping those from Colombo is better known in Ceylon than by me, as my figures are now a month old. But the price has evidently fallen considerably as might be expected, seeing that blacks are so cheap. I know that a Colombo firm wired on 31st December to Toronto offering to deliver *there* the *finest Green* at 6¾d. These had previously been costing 8½d. in Toronto. The stimulus of the bonus, added to the unprecedently low price of black tea, may well cause shipments to exceed the demand in Canada, which, we must not forget, is entirely in its infancy. The low price of blacks is itself sufficient stimulus to

create the supply of Greens in Ceylon. Our efforts and money should now be employed in encouraging those who are trying to make those teas known, and to get them into consumption. The unfavourable conditions in the States, during the last half year, made me spend less of our Fund there; while the favourable conditions in Canada justified me in increasing our efforts in that country."

UNIVERSAL INTERNATIONAL EXHIBITION HELD IN PARIS DURING 1900.

A sum of £2,000 sterling was granted towards the representation of Ceylon at the Paris Exhibition, and this amount has been paid to Government. Subjoined is the Official Report, on the Planting Exhibits at the Paris Exhibition by J. H. Renton as representative.

REPORT ON THE PLANTING EXHIBITS AT THE PARIS EXHIBITION, 1900.

In addition to my duties as representative of the Planting Community at the Paris Universal Exhibition of 1900 I had also to undertake the work of Special Ceylon Tea Commissioner for the whole of Europe. I, therefore, judged it wise to have an assistant who would remain in Paris throughout the whole time of the Exhibition, who would be specially in charge of the work inside the Exhibition and take the supervision of the tea-house and garden. I also thought it necessary to have a lady who would be responsible for the making and distribution of the tea, arrange for the ordering of the supplies and be in charge of the European and Native attendants. On the suggestion of Mr. F. G. A. Lane and with the approval of Mr. W. E. Davidson, I appointed, before I left Ceylon, Mr. R. V. Webster to the former post, and at the request of Mr. W. McKenzie I engaged Miss Parkinson for the latter. Miss Parkinson's long residence in Ceylon and her experience gained under Mr. McKenzie in "demonstrating" tea in America made her eminently a most suitable person for her post. Mr. Webster's experience gained in pushing Ceylon tea for the past ten years all over the world and his unique experience of no less than five Exhibitions, and of the manner in which tea shows are run, induced me to believe that he would be the best fitted to undertake the duties of Representative in the Exhibition of the Tea interests of Ceylon. Both appointments have been fully justified by the results.

Tea Exhibits.—The case containing these were provided with five divisions on each side. Each division contained twelve little spaces 8 feet by 8 feet—and three of these divisions were allotted to each estate, to hold samples of Broken or Orange Pekoe, Pekoe and Pekoe Souchong. Thirty-seven estates exhibited, but one or two exhibited fancy as well as Commercial teas. Three estates exhibited green teas. The cupboards below the exhibits were provided with glass doors: the boxes containing the balance of the teas were stowed away in them and the front filled up with teas in packets kindly lent by the Co-operative Tea Gardens, Maravilla Tea Company and the Harrow Estates Company.—A light wooden frame was run along the centre of the stand and two rows of photographs exhibited on each side. These were the photos provided by the Planters' Association illustrating upcountry scenes, work on estates, and in factories. The photographs enabled us to make this a fairly attractive show, but, as a rule, it was of interest only to experts or those specially interested either in the trade or in Ceylon generally. Samples of various grades of tea were of little interest to the general public. One cannot be surprised at for samples, such as these, can be seen in any grocer's window. So far, therefore, as our main staple was concerned, the exhibit in the Ceylon Court cannot be said to have done much to impress visitors with the importance of the tea industry of the Colony. I think that on a future occasion it would be better to have a dozen or more large circular stands with shelves, and to place the various exhibits and handsome glass vases or jars on them. Owing to want of space I had to abandon the idea of having a huge heap of Golden Tip Tea in bulk under glass, in a good position in the Court. In place of this heap on the suggestion of Mr. Webster, the four pillars in the main passage through the Ceylon Court were covered over under glass, with Golden Tip Teas. Mr. Webster undertook the bulk of the work in carrying out this main tea exhibit and made all the arrangements for the display of the photographs.

Cocoa, Coffee, and Cardamom Exhibit. These were all in one case. On one side the Coffee and Cocoa in bean, on the other the Cardamom, Cocoa in pod, Vanilla, and Nutmegs. The Coffee was exhibited in eight small spaces in the centre of the division, the Cocoa in sixteen spaces on either side of the Coffee. Cocoa exhibited from seven estates; Coffee arabica from two; Libe from one. In the centre of the division on the other side was Cocoa in pod and the Vanilla from Galagedera Estate; and on side of it, the handsome exhibit of Cardamoms from Duck Estate, while on the other were the Cardamoms from Forest and Mousakande and the Nutmegs from Doranakande.

The private exhibits made by the Co-operative Tea Gardens C pany, the Maravilla Ceylon Tea Company, and Lipton, Ltd. September and October, 1899. I advertised in the Ceylon papers t space would be reserved for private exhibitors in packet and bulk I had been urged to make up my own packet teas and sell ther some depôt in Paris, if the sale was not permitted at the Exhibit I felt that as neither the Planters' Association nor the 30 Comm tee were a trading body, that though such a course would be p fectly feasible during the Exhibition, yet after it was over, th would be no firm or business agency to carry on the sale of particular Brand. The Planters' Association being unable to the Brand or mark (specially adapted for the Exhibition) to one particular firm, I, therefore, was in hopes that private in viduals or firms would come forward and establish depôts in Pa with stands at the Ceylon Court, and run the chance of effect sales. Only the three firms above-mentioned availed themselve the opportunity. Unfortunately, Messrs. Lipton, Ltd, were o prepared at first to book orders for blends of Ceylon with Chi Without expressing any opinion as to whether or not this was best means of introducing Ceylon tea to the French public I f that in an Exhibition where Ceylon, and pure Ceylon tea on was supposed to be exhibited, it would not be right to allow Ble of Ceylon tea to be sold, or orders booked. Messrs Lipton, L agreed to withdraw their Blends and sell pure Ceylon tea. bu was not until June that they were able to commence sales. T exhibit made by the Co-operative Tea Gardens, and the Marav Co.'s was an especially attractive and handsome one, and their hibit combined with that of Messrs. Lipton, Ltd., have been t most powerful aid (so far as exhibits in the Ceylon Court wh in helping us to impress the general public with the importance the Ceyion Tea Industry. There is, of course, no question that t tea-house and the sale of tea in cup has been by far and away t biggest factor in bringing Ceylon tea before the notice of t general public and that the great success which this institution h had has enabled us to secure a splendid advertisement for Ceylon t without the help of any of the exhibits of the Ceylon Court. At t same time, the neat little packets exhibited in a dozen different kin of wrappers, by the two first-named companies took greatly wi the public and were a most efficient factor in introducing Ceyl tea. I felt very grateful that I could refer intending purchase of Ceylon tea to the depôts established by these two companies Paris in the first instance. In a short time the sale of Ceylon t in the Exhibition was commenced, and continued to the close. feel certain that if the Co-operative Tea Gardens Co. and the Ma villa Ceylon Tea Co. had not made this exhibit of pure Ceylon t in packets, Messrs. Lipton, Ltd., would not have followed suit, b would have stuck to their blends. I should then have been oblig to make up packet teas of my own, for the time being, or else all intending purchasers to go without being able to get Ceylon tea the Court. I wish it to be clearly understood that the sale of Ceyl tea in the Court has never been sanctioned by the Authoriti When these companies saw other articles being openly sold in the other Courts, and that tea was sold in Japan and Russia t Co-operative Tea Gardens Co. commenced selling at their own ri and Lipton, Ltd., followed suit after a time. On two occasions th have been warned to desist by the British Royal Commission, a on one occation by the French Authorities, but they have gone and taken the risk. In addition to their exhibit of Fancy Tea tins, Messrs. Lipton, Ltd., made a very attractive exhibit of Cof and Cocoa

Tea Factory.—Only one of the models was exhibited; the oth was placed on the top of the tea-house, there being no room for it the Court.

On 11th of June, Mr. Marcel, of Havre, applied for space which to sell packet teas, but by this time (nearly three mont after the opening of the Exhibition.) all the space had been allott and the various exhibits arranged. . . .

B.—TEA-HOUSE.

Tea-house.—The completion and furnishing of the tea-hou

sed a great deal of extra work and worry. The contractors had arted from the original design, the terrace or first floor should e been sorrounded by an open balustrade, instead of which a d high wall had been built. Although a roof was shown on the n, we had to provide an awning and blinds at our expense and, ng to the height of the wall, the floor had to be raised. Kitchen l counter space was insufficient, even although two additional ms were built on to the kitchen. The interior of the building was ely furnished and decorated by Miss Parkinson and Mr. Webster. e walls and pillars were covered with photos of Ceylon views and nery. The tea-house has had a success which exceeded all my i-ipations. We had to provide two more urns, and in June and y to increase our seating accommodation until it came up to e hundred from three hundred.

We served in	May	12,955	pots of tea.
Do.	June	22,351	,,
Do.	July	24,141	,,
Do.	August	19,312	,,
Do	September	25,009	,,
Do.	October	30,489	,,

Total...134,257 in six months

N.B.—A pot contains two cups of tea.

The above does not include the teas given gratuitously to the embers of the Ceylon Commission or their friends. I attribute is success to the following causes: *First*, to the goodness of the ticle: the tea was very carefully made and poured (after five inutes' infusion) into an urn, heated by hot water.

Secondly, to the Sinhalese boys, with their rapid and civil wait- g. We had to engage waitresses, in addition to the boys, but ere is no doubt that the boys a great draw. I want to take this portunity of expressing my appreciation of their very good and cellent behaviour during the whole time of their stay in Paris.

Thirdly, to some lady friends, journalists, and to others who from e very first have assisted us by advertising both the merits of ur tea and the attractions of the tea house. In the Summer, most usiness was done between four and seven o'clock, but in the utumn, especially at the end of October, the rush was always etween three-thirty and five o'clock. The tea-house was kept open ll eleven o'clock p.m. till the end of August, after which it was osed at eight o'clock.

C.—REWARDS.

Rewards.—I acted as British Juror in section 3 of class 39. *offee and Cocoa.*—I am glad to say I was successful in obtaining n award of some kind for each exhibitor in this class, although the umber of the exhibits sent were few, yet the total quantity of pro- uce was sufficient to occupy three times the space they did had e been able to obtain more room. I saw a Grand Prix was given r the best exhibits from other countries in this class, and I made n effort to get one for a Ceylon exhibitor. The jury awarded it Messrs. Lipton, Limited, mainly on the ground of the excellent nd variety of their Coffee exhibit. The French official catalogue r this class contained the names of only three exhibitors—Badulla, Haputale, and Northern Districts Planters' Association. The jury ery kindly, and without hesitation, accepted my amended list of welve individual exhibitors. At the same time it is a matter of egret that the official English catalogues, from which the French ere made, were not more carefully compiled in the first instance. he omission of individual exhibitors' names occasioned me a reat deal of trouble with the juries in class 59, 41, and 63. (Tea, pices, non-edible agricultural products, and mines.)

I see that in the official list of awards a Gold medal has been iven to the Ceylon Planters' Association in class 39. I fear this is n error. The class jury awarded no medal to the Ceylon Planters' ssociation, as a collective body, for the exhibit. I did not ask for t, because I did not see how the jury could award a second Grand rix in the same class to Ceylon, and I did not care that the ssociation should receive a lesser award than that given to an individual exhibit in the same class.

The superior jury, however, may have given it.

Class 59—*Tea and Spices.*—I am not quite so satisfied with the wards obtained in this class. The official catalogue contained nly the names of the various District Associations no individual states or companies being included. The jury in this class was ot nearly so complaisant as the jury in class 39, an official application had to be made to the French administration before the amended list of exhibitors could be accepted. Out of 37 exhibitors in Commercial, Black and Green Teas, 26 awards were made; but no awards have been given to Fancy Teas in Commercial Teas in packets. I am exceedingly sorry the Fancy Teas shown by the Co-operative Tea Gardens, Messrs. Lipton, Ltd., Kintyre, Pedro. and Hatherleigh Estates did not obtain extra and special awards, I think that the packet tea exhibit of the Co-operative Tea Garden, and the Maravilla Co. should have obtained a very high award. I drew the attention of the jury to the Golden Tip Tea kindly presented by Neboda, Taprobane, Mipitiakanda, Deaella, Newton, and Middleton Estates, for covering the pillars; but as I could not say they were exhibitors in the proper sense of the word (their names not appearing in catalogues), they obtained no recompense. Had I known how awards were given to "Collaborateurs," I should certainly have brought their names forward under this category. A Grand Prix was given to the Planters' Association of Ceylon for the Collective Exhibit of Tea. The jury proposed, in the first instance, to award the Grand Prix to myself on behalf of the Association. I declined to accept the suggestion, and pointed out that it should be given to the Association only.

I understood from the jury that they would give awards to the Cardamom Exhibits from the Duckwari, Forest Hill, and Mausakande Estates. I was sorry to see when the official list was published that no awards had been. On an appeal to the Superior jury, a Gold and Bronze Medals have been obtained for these exhibitors as "Collaborateurs," but these cannot be regarded as equivalent to a reward for their exhibit as their names do not appear in the official list. In class 41, I was successful in obtaining a Gold and two Silver Medals for the three Cinchona exhibits. I noticed after the official list of awards was published, that several awards have been given to "Collaborateurs" from Ceylon. I much regret that the possibility of obtaining rewards in this way was not brought to my notice. Had I been aware of it, I should have applied for special rewards for Mr. Webster, Miss Parkinson, and Messrs. Burnham and Dupre. The two former did much to lay out the Tea Exhibits, and get the Tea-house ready. The two latter who acted as salesman for Ceylon teas in the Court, are as much entitled to awards, as Mr. Hayward's salesman and saleswomen, to whom Bronze Medals have been awarded. Mr. Davidson has applied for and obtained Silver Medals for Mr. Webster and myself as "Collaborateurs." The application for Miss Parkinson was refused. I am much obliged to Mr. Davidson for interesting himself especially on our behalf, but I have never made any claim for any personal reward for work done in connection with the Exhibition, as I have all along understood that it was a rule of the Exhibition that members of the jury were *hors concours* even as "Collaborateurs."

D.—RESULTS.

Result of the Exhibition.—Sir William Mitchell has dealt with the trade in cocoa in his report.

I may add that I learn that most of the French chocolate manufacturers assert that the Ceylon variety does not suit them; but the leading import-houses here think that our cocoa has much improved. It was the importations of more than ten years ago that created a bad impression. At any rate the samples shown at the Exhibition were much admired, and a bigger trade ought to be done. At present all the imports are from Guayaquil, Venezuela and Trinidad.

India rubber.—I have had many enquiries for this article. I hope the day will come when it will enter largely into the list of exports from Ceylon.

Cinchona.—Quinine manufacturers would like to have Ceylon bark again, but at cheap rates. There is little hope of this wish being gratified.

There seems to be every prospect of an improvement in the price of quinine, and we may hope that the cultivation of Cinchona will be resumed in Ceylon to a moderate extent.

As regards Tea, we have made a good beginning and I am in hopes that Ceylon tea has come to stay. It is not the Exhibition only that has helped us it is known, but the extensive advertising, and in making personal canvassing of the trade, both wholesale and retail. This report deals only with the Exhibition. My full report on the work in France will follow at the end of the year; but I feel we have done more than awaken a mere passing interest in Ceylon

tea. Those people who have had it in cup, like it; and I trust the taste will grow. It must never be forgotten that France is not a tea-drinking country; and even if we oust China teas by degrees this will only mean a consumption of 1½ million lbs. What we must seek to aim at is to spread a taste for tea amongst the labouring classes and bourgeoisie. I have omitted to mention that, apart from the Ceylon Court and Tea-house, we had our tea on sale in cup in fifty-two restaurants and cafés in the Exhibition. I do not think that with the exception of Slater's Restaurant much tea has been sold at these cafés, but as all these restaurants displayed placards "Ask for Ceylon Tea" the advertisement was an excellent one.

CEYLON TEA ON THE CONTINENT OF EUROPE.

Up to 31st December, 1900, £7,000 have been remitted to London for Mr. J. H. Renton's operations on the Continent of Europe, while R11,202·50 have been disbursed in Ceylon at his request in payment of tea, etc., shipped to France for purposes of campaign. So far the only apportionment of these amounts is as follows:—

Account Commissioner for the Continent of Europe, £1,000 at 1/4	R15,000·00
Account Representative at Paris International Exhibition, 1900 . ... £500 at 1/4	R7,500·00
	R22,500·00

INDIAN AND CEYLON TEAS IN CANADA.

Indian and Ceylon teas—the latter especially—figure prominently on the advertisement sheets of the *Canadian Grocer*. The same contemporary gives an illustrated account of "Where Two Brands of Tea are packed," saying:—

In last week's issue of the *Canadian Grocer* mention was made of the amalgamation of two of the leading Canadian packet tea firms through the absorption of The Monsoon Tea Co., Toronto, by The Blue Ribbon Tea Co., Winnipeg and Toronto. The combined business will be conducted on the premises of The Blue Ribbon Tea Co., at 12, Front Street East, Toronto, under the management of Mr. Robert McKay. These premises, which consist of four storeys and a basement, were specially planned for the most economical and expeditious handling of a packet tea business. The accompanying cuts will give a fair idea of the method of work in several departments.

It is the intention of The Blue Ribbon Tea Co. to keep both "Monsoon" and "Blue Ribbon" on the market. Mr. McKay states that the quality of "Monsoon" will be greatly improved, but its general characteristics, *viz.*, that of a very flavory and delicate tea, will be retained, while "Blue Ribbon" will be packed precisely as before.

It is interesting to note the progress of the packet tea business in Canada. For many years it was a debatable question whether packet tea had come to stay, but the large and ever-increasing sales of such teas as "Blue Ribbon" and "Monsoon" show clearly that the tea trade of Canada, like that of Great Britain, is fast getting into the hands of the larger packet firms.

THE ART OF SINGING.

BY SIMS REEVES.

"Remedies for the Throat."

"All kinds of lozenges for the voice are to be avoided; some do harm, others have no effect, and none do good. Sugar and water, or a little glycerine, gives relief when the throat is inclined to be dry; this applies to persons whose throats are affected by the weather. About a third of a teaspoonful of Condy's Fluid in a tumbler of water, if used as a gargle every morning, will clear the throat and brace up the uvula, which, in some singers, is so long that it interrupts the pure emission of the voice, and introduces a grating undertone, while it also tends to make a tremolo on the upper notes."—*The Idler*, February, 1900.

It is curious to note the revolution that has taken place in tea trade since the old days, when it was all shipped from Ch during a few months of the year. China Congou is now almos thing of the past, so far as Canada and England are concern nine-tenths of the black tea for these countries being impor from India and Ceylon.

Another great change in the tea trade has been brought ab by the almost universal practice of blending several teas togeth in order to produce what is known as a "perfect tea of its kind."

It is in this scientific tea-blending that the packet people cla to have such an advantage. It may take years to successfu study public taste and produce a perfect tea but once produced, can easily be kept up to the standard by means of blending.

The dealer in bulk tea says: "What is the use of paying packi and advertising charges? Cannot I give better value with bulk teas

The packet teaman replies: "You cannot please your custome with bulk tea because people have found out that the tea in so particular packets is always fresh and good and suits their taste.

"But," replies the grocer, "I can blend my own tea, or b blended tea from my wholesale house."

"Quite true," replies the vendor of packet tea, "but tea-blendi is a science and anyway you must first get your tea and this is ju what the ordinary merchant cannot do."

The teas, for instance, that go into "Blue Ribbon" are, Mr. M Kay informs us, imported fresh every month of the year fro Ceylon estates that are pledged not to sell a pound of their tea any other firm in Canada.

Until very recently, all green tea used in this country came fro China or Japan, but during the last year much attention has bee given to the production of green teas in Ceylon. It is qui possible that Ceylon and Indian green tea will, in the near futur displace a very large amount of Japan tea in both the Unite States and Canada.

All the leading packet firms are now putting up Ceylon gree tea and it is meeting with a very good reception by the te drinking public.

THE AGRICULTURAL CHEMIST TO THE GOVERNMENT OF MYSORE.

The following are Extracts from the Report of the Agricu tural Chemist to the Government of Mysore for the yea 1899-00:—

LABORATORY.

As a Chemical Laboratory is a matter of prime importance to a Agricultural Chemist, several plans for such a laboratory were pr pared by the Agricultural Chemist and State Geologist. The pla selected by the Government provides for the chemical work of th Geological Department being done in the same building as tha containing the laboratories and office of the Department of Agricu ture. In it the present "Geological Laboratory" is included. Th fixtures are being made similar to those of the laboratory of th Central Experimental Farm, Ottawa, Canada, and will, it is hope prove as eminently satisfactory as those from which they wer copied. Before building the necessary additions, the Departmen of Public Works are kindly undertaking to make all the change required in the present building to adapt it to the new require ments. This will give the Chemist some space in which he ca begin analytical work before the entire building is completed— kindness for which he is very grateful to Government and the Department of Public Works. The chemical apparatus has bee selected from various catalogues so as to get the best value. A always, a portion of it had to be made to order to meet speci requirements or to embody improvements which appeared desirabl A large portion of it has arrived.

SAMPLES.

Chemical.—Twenty-five samples taken in connection with th study of various problems of general interest to coffee planter

awaiting analysis. In addition to these, ten miscellaneous ples have been received. To dispose of this work only will uire at least three or four months, and numerous other samples waiting to be sent as soon as there is some prospect of r being taken in hand.

Mycological. -Eleven samples of plants affected with fungoid eases were received and disposed of as circumstances permitted. that could be done was to recommend the application of rdeaux mixture where practicable.

Entomological.—Three parcels of larvæ of injurious insects were eived during the year. For leaf-eating insects not protected by overing, an application of Paris green cannot be too strongly re- mmended, provided care is taken not to poison domestic animals men. Paris green is an arsenite of copper which has been gely used as a pigment; and is now one of the most popular in- ticides. It may be applied either as a spray when suspended in ter (about one ounce to ten gallons of water) or dusted on the nts in the dry condition when mixed with 100 times its weight perfectly dry fine flour or better still "land plaster" (Gypsum) if can be got. Since the close of the year, several samples of in- rious insects and plant diseases have been received. These made neccessary to visit several fields and have led to a practical de- nstration in applying Bordeaux mixture. Paris green could t, unfortunately, be obtained at the time. In the near future it ay be necessary to write a bulletin on the subject. When nding insects it is absolutely necessary to provide them th some of the leaves of the plants on which they are feeding Much more important than the correspondence, in the way of ving information, were the interviews in the office; and more portant still, the talks and lectures on the estates, the villages, the fields and gardens visited when on tour. But of these no cord is kept. In response to an invitation from the United anters' Association a general outline of plot experiments and me of the fundamental principles of manuring were discussed at eir meeting held in Bangalore.

TOURS.

The three principal tours undertaken during the year were—

1. To Bidadi and Closepet.
2. To Koppa
3. To Shimoga District and Mangalore.

A tour to Koppa was undertaken in July to become person- ly acquainted with the effect of the very heavy rains which sually occur during that season of the year in the Malnad istricts. But owing to the practical failure of the monsoon, not ven a moderately heavy shower of rain occurred during the stay f nearly two weeks. The time was occupied in noting what could e seen of the diseases of coffee and arecanut. These diseases are f a fungoid nature. The condition of the moisture, which largely nfluences the growth of the specific fungus, especially Koleroga, s doubtlessly one of the most important factors in the spread of he diseases mentioned. But as the vitality of the trees has oubtlessly something to do with resisting the attack of the disease, he task of finding a remedy is not absolutely hopeless.

The coffee works at Mangalore were visited to see the last step f the preparation of coffee for the European market.

NOTES FROM BRAZIL.

(From the *Brazilian Review.*)

São Paulo, 1st January, 1901.—The Secretary of Agriculturel has ddressed a letter to the Directors of the Dourado Railway Company nclosing a petition received by him, signed by 68 planters in the istricts of Boa Vista and Figueira, begging that the projected exten- ion of the abovenamed line to Boa Esperança be carried as near hose places as possible. Statistics accompany the latter communi- cation showing that there exist in that neighbourhood some 5,000,000 coffee trees whose produce has at present to be transported a dis- tance of from 20 to 25 kilometres to the stations of Dois Corregos nd Jahú; whereas the new extension might easily be constructed o as to pass within 3 to 8 kilometres of where they are. The Minister requests the Directors of the Dourado Line, to give the matter their favourable consideration and report to him the result of their deliberations.

Reports from S. Simão state that the plantations there have suffered great damage from rain and hailstones accompanied by violent gales of wind. Work at the Fazendas has been interrupted, not only from this cause, but also from scarcity of hands; the emigration of labourers being continuous, while there is no immigration to counterbalance it.

Floods have been causing damages in Penna de Franca lately.

The *Correio Paulistano* hears that a European Syndicate is about to undertake the exploration and colonisation of the rich and fertile zone of Ribeira de Iguape, to the south of this State. Snr. Enrico Boccolini, Engineer of S. Paulo, has been commissioned to send in the necessary report and surveys.

Planters in Pereiras and Faxina are trying experiments in the cultivation of rye, with results which are, so far, considered highly satisfactory.

The President of the Agricultural Municipal Commission of Faxina reports the following: Coffee planted in the Municipality in full production 300,000 trees. Cotton crop is estimated at 30,000 arrobas. Wine: production of three establishments with about 100,000 vines, 85 pipes. There are 20 farmers engaged in cattle and horse breeding. Dairy produce is plentiful and food stuffs are being produced in very large quantities.

The Sugar-Coffee War.—Arbuckles and Havemeyer at it again. Advices from New York state that the Sugar-Coffee war has broken out again with renewed virulence. On the 25th of November the Sugar Trust commenced the attack by cutting prices of their brand of coffee 1 cent. per lb., which was immediately met by a retaliatory cut by Arbuckles of 15 cents per 100 lbs. in sugar. This the Sugar Trust refused to follow as they say that at 5·45c profit in sugar ceases. They, however, profess to "be expecting further declines in raw coffee, in which case package coffee will be promptly reduced." As current quotations are already at 9 1/2c. for the Havemeyer Lion Brand, the prospects of coffee can scarcely be described as rosy, to say the least of it. At 9 1/2c. per lb. and 10d. exchange the price per kilo. of roasted coffee in the States is equivalent to precisely 1$003 per kilo., whilst in Rio de Janerio itself the retail price is Rs.1$280 per kilo. Either some one here must be making a pile or American packers be true philanthropists! All the same they are a damned nuisance with their cuts and countercuts and if the Government could introduce a clause into the Commercial Treaty stipulating that both Havemeyer and Arbuckles should have their heads cut off, there would be some sense in it. What earthly use a treaty is going to be so long as this little game is unchecked it is hard to say.

Certainly by continually cutting prices the field of consumption is enlarged, and, were the advantages of lower prices extended everywhere to real consumers as in the States, there would be no great objection, but in Europe it is not so, and every cut only puts so much more profit into intermediary pockets without stimulating consumption at all or very little. To get at the European consumer, what is necessary is to start great Roasting Houses on the American model, who shall import their own raw material.

In this way, at least, every considerable fall of prices would be followed by some expansion of consumption and be thus to a degree counteracted.

Exchange.—Extremes during the week ending January 4 were 9 3/4 —9 31/32 d. for 90 d/s Bank paper and 9 13/16—10 1/16 d. for private.

The average Bank 90 d/s counter drawing rate for the week comes out at 9 55/64 d. the corresponding sight rate being 9 51/64 d. against 9 7/8 d. the average sight rate of the *Camara Syndical.*

The average depreciation for the week, calculated on the basis of the Banks' sight rate, is 63·71% and the premium on gold 175·60% against 63·88% and 176·92% last week.

Rio, January 5th, 1901 Ninety days' rate on London opened on Monday, 31st December at 9 15/16d and closed this evening at 9 13/16d. steady. 1900 closed its disreputable career in a bullish humour with rates quoted at 9 31/32d. exactly 3d. higher on the 31st December, 1899. The closing rate of the last four years was as follows: 1897, 7 13/16; 1898, 7 11/16; 1899, 6 31/32, and 1900, 9 31/32d. Two years ago it was too much money and the fall of exchange that was sending the country headlong to perdition, now it is the other way about, no money and rising exchanges! Alas! men never are but ever too blessed; otherwise a rise of 4 11/32 in 2 1/2 years ought to suffice any one. Leaving detailed analysis of the causes for another occasion, there is no disputing the fact that there has been a notable improvement in the rate during the past year, an improvement that

there is every reason to expect will be continued during the current year if, perhaps, on a more modest scale. During 1900 there were many factors that contributed to raise exchange, amongst which may be enumerated the considerable rise of coffee in foreign markets, the shrinkage of imports and especially the tightness of money throughout the Union. The firm and rising tendency of rates during the last few days of the year somewhat unexpectedly weakened during the past week and, instead of the rising tendency expected after the liquidation, rates were last week decidedly flat. One of the banks was reported to be taking heavily and endeavouring to bear exchange. The market, however, is decidedly optimist for the moment and believes in a rise and so, plenty of bills being forthcoming, these mysterious manœuvres had but little effect and in spite of them the market closed steady with bills offering at $9\frac{7}{8}$d.

Compared with the two previous years the Statistical position of the Market on the opening of the year was as follows:—

		1899.	1900.	1901.
90 days' rate...		$7\ ^{11}/_{16}$	$6\ ^{13}/_{16}$	$9\ ^{7}/_{8}$
Cash in Rio Exchange Banks in Contos		65,031	42,634	45,962
Depositos in c/c	,, ,, .		—	45,272
Debit to Home offices	,, ,, .	7,846	—	—
Credit with	,, ,, ,, .	—	2,110	2,452
Paper money, in circulation	,, .	785,942	733,727	699,000
Bank of England rate ...	.	4 %	6 %	5 %
Price coffee London per cwt.	s .	$3\ ^{1}/_{6}$	$3\ ^{5}/_{6}$	$3\ ^{2}/_{6}$
,, ,, Rio per 10 kilos	rs .	7$900	9$200	6$700
Coffee shipped during year	bags £	10,153,543	8,776,359	
Value f o b	bags .	14,198,000	17,500,000	
Stocks at Rio and Santos	bags.	—	817,274	1,454,830

Roughly, the position is this: the local market has cleared off its indebtedness to London and accumulated a small credit; of 2,452 contos, which can be drawn if required.

On the other hand, the cash balances are particularly low, and only just cover sight deposits. This time last year the Banks, though their cash was even less, were in a stronger position, having a credit with Home offices and branches of over 20,000 contos. Paper money in circulation has diminished 34,000 contos since January, 1899 and 34,000 since 1900, but in addition to this the failure of the Banks has locked up vast sums of money, on the one hand, and intimidated possible depositors on the other. Consequently, the stringency of of money is greater than ever and, so long as it exist, any decided *bear* movement must be very precarious.

Looking abroad, though lower than last year, the 5 per cent. Bank rate is not reassuring and would be almost certain to provoke active remittances except for the tightness of money. As far, therefore, as the purely monetary factors are concerned, they appear to be of a neutral character, one neutralizing the other and tending to keep rates steady.

During the past year, the principal factor of improvement in exchange was undoubtedly coffee, which gave over £3,000,000 more than in 1898, and on it, again, the future of exchange must mostly depend. On the 2nd January, 1900, sterling prices were actually slightly over current rates, whilst their tendency was unmistakeably upwards, instead of downwards as it present. Considerable stress is being laid on this feature of the market, and, certainly, were this market ruled by purely sentimental considerations, a fall would be inevitable. That sterling coffee prices are likely to fall or at any rate to be considerably under those ruling last year, is possible, but it does not follow that the balance of foreign payments would, therefore, be equally affected. On the contrary, there seems every probability of the difference in price being made up by the increase of quantity and that, after all, the value furnished in bills during the first six months, at least, will be quite up to last year's.

Entries and shipments of rubber for the first half of the season show little alteration in volume compared with the two former years, and may be expected to give results similar to last year's for the second half. Prices, however, have fallen and the value of rubber exports during the next six months will in all probability fall about £1,000,000 short of that of the same period in 1900.

On the other side, 90 and 120 days' acceptances for imports now falling due cannot be on a heavy scale and, in fact, judging from the customs revenue, are less than in 1900. It is true that from the 1st January Government requirements will reduce available bills by the equivalent of the increase of the gold duty on imports, but at most this cannot exceed £600,000 per annum and will certainly not be heavier in the first half of the year. There are, in addition, several undertakings on the tapis that are sure to bring grist to the mill sooner or later, whilst the position that the Banco Republica is rapidly assuming may be reckoned on as a new and powerful element of stability.

In the present state of quasi equilibrium of foreign payments, the most powerful factor of stability is, after all, the scarcity of money which, whatever inclination may be, practically prevents any organised "bear" movement.

The burning of paper money, which will shortly be renewed, however its real effect may have been discounted by the money having been practically withdrawn for some time from circulation, must exercise a powerful moral effect which cannot fail to be wholesome and favourable to the rate as it was last year and the year before, when exchange commenced to rise immediately after burning was started.

It is not, however, high or even rising, but steady exchange that is required. A rate oscillating about 10d. as it has done for the last four months is infinitely to be preferred to a big rise that could only serve to disorganize commercial relations once more.

DECEMBER COFFEE MOVEMENT IN THE UNITED STATES.

The *American Grocer* remarks :—

Heavy receipts in Europe and the United States during the past six months; an increase in the world's visible supply of 1,719,7[illegible] bags, and receipts at Rio and Santos greater than ever recorded for the same period, except in 1897-98, are leading features of the coffee movement for the first half of the trade year, beginning July 1, 1900.

The total deliveries in the United States and Europe for six months ending December 31, 1900, were 6,920,399 bags, against 7,770,580 bags for the corresponding time in 1899-1900; 6,359,98[illegible] bags in 1898-99. The average deliveries for the first half of the past three seasons was 7,016,988 bags, so that the deliveries for the past six months fell 96,589 bags below the average, while those for the first half of the previous year were 753,592 bags greater—a fact which substantiates the claim that the increase in the deliveries of that year did not represent actual consumption, but the heavier stocks in second and third hands.

The December deliveries in Europe and the United States were 1,180,838 bags, of which 633,328 bags in the United States, and 547,510 bags in Europe. The deliveries in this country were the heaviest for any month since January, 1900.

The following statement shows the movement and general position of the article :

	Bags.	Bags.
Stocks, December 1, 1900—		
United States	995,867	
Europe	3,906,275—	4,902,142
Receipts during December -		
United States	669,071	
Europe ...	1,522,970—	1,192,041
Total supply, January 1 ...	...	6,094,183
Less stocks, January 1, 1901—		
United States	1,031,610	
Europe ...	3,881,735—	4,913,345
Deliveries, December		
United States	633,328	
Europe	547,510—	1,180,838
Deliveries, December, 1899—		
United States	419,679	
Europe ...	666,616—	1,086,295
Increase as compared with December, 1899 ...	...	94,543
Deliveries (United States and Europe) November	...	1,281,638
Do. (do. do.) October	...	1,340,059
Do. (do. do.) September	...	981,198
Do. (do. do.) August	...	917,608
Do. (do. do.) July	...	1,219,058
Total for six months, 1900	...	6,920,399
Do. do. 1899	...	7,770,580
Decrease as compared with 1899..	...	850,181

The December deliveries in the United States consisted of 568,9[illegible] bags of Brazil and 64,381 bags of all other sorts.

e visible supply of the world on January 1, 1901, was 7,560,345 , against 7,874,142 bags on December 1, 1900 (a decrease of 97 bags), and 7,036,093 bags on January 1, 1900.
ie visible supply on July 1, 1900, was 5,840,561 bags, so that in nonths it has been increased 1,719,784 bags.
he total receipts at Rio and Santos for the first six months ie trade year were 7,060,000 bags, against 6,710,000 bags for same time the previous year, and 5,579,000 in 1898-99.
ading on the New York Coffee Exchange was light, reaching al of 543,500. Spot coffee, No. 7 Rio, fluctuated between $7\frac{1}{2}$ $6\frac{7}{8}$ cents. The lowest price for options was 5·35 cents for uary and December; the highest, 6·80 cents for October.
ith a crop in Brazil of over 10,000,000 bags, and a visible sup- equal to six months' consumption, there is little chance for h higher prices.

OVER MY TEA CUP.

A grocer's tea canister has caused Charles J. Everett to ak out into verse, and with the aid of the pen of Frances Bowditch, to adorn the pages of the *American Grocer*. e sketches we cannot reproduce, but here are the verses :—

This homely can of painted tin
Is casket precious in my eyes;
Its withered fragrant leaves within,
Beyond all costly gems I prize.
For in those crumpled leaves of tea,
The sunbeams of long Summer days,
The song of bird, the hum of bee,
The cricket's evening hymn of praise.
The gorgeous colors of sunrise,
The joy that greets each new-born day,
The glowing tints of sunset's skies,
The calm that comes with evening grey.
The chatten of contented toil,
The merry laugh of childish glee,
The tonic virtues of the soil,
Were caught and gathered with the tea.
Lifeless those withered leaves may seem,
Locked fast in slumber deep as death,
But soon the kettle's boiling stream
May rouse to life their fragrant breath.
With sigh of deep content we breathe
The sweet mists rising lazily,
With eager, parted lips receive
The first ambrosial taste of tea.
For light and warmth and mood of men,
Whate'er the plant hath heard or seen,
Or felt, while fixed in field or fen,
And stored within its depths serene,
Are now transmuted into thrills
Of sense or feeling, echoes faint
From peaceful, perfumed tea-clad hills,
From placid Orientals quaint.
And fancies born in other lands,
Which dormant lie in magic tea,
Dream-castles fair not made with hands,
By some mysterious alchemy
Emerge from cloudland into sight,
Transform the sombre working-world,
The gloomy hours of day or night
From leaden hue to tint of gold,
Bring rest to wearied heart and brain,
Kind nature's soul to us reveal,
Enlarge the realm of Fancy's reign,
Renew the power to see and feel
The radiance of the rising sun,
The sunset's glow, the moon's pale light,
The promise of a day begun,
The rest from toil that comes with night
And as I sip my cup of tea,
Though not a friend may be in sight,
I know that a brave company
Is taking tea with me this night.

DISTRICT ASSOCIATIONS.

INDIAN TEA ASSOCIATION (LONDON).

The following is an Abstract of the Proceedings of a Meeting of the Committee held on January 22, 1901, when the following members were present:—Mr. D. Cruickshank (in the Chair) and Messrs. A Bryans, J. S Hulbert, C. C. McLeod, F. A. Roberts, J. N. Stuart, A. G. Stanton, and C. W. Wallace.

The minutes of the last meeting held on January 1 were read and confirmed.

Correspondence with Calcutta copies of which had been circulated was laid on the table.

Restriction of Output.—The question of restricting the output of tea was fully discussed and the Chairman submitted a draft of the resolution, proposed to be put before the meeting of members of the Indian and Ceylon Associations on the 23rd instant, the terms of which were agreed to.

Reduction of Duty—Agitation in the Press.—It was decided that the sub-Committee should act on the terms of the resolution adopted at the meeting of the General Committee on January 1, but that in view of the action intended to be taken by Sir H. Seymour King in the House of Commons, all communications proposed to be sent to the Press should be submitted to him for approval before being published.

Tea and Gunny-bags.—A letter received from the Tea Brokers' Association of London, dated 11th instant, condemning the practice of the placing tea in proximity to gunny-bags having been read it was noted that the Secretary had addressed the Conference Liners on the subject with a copy of the above letter, the receipt of which had been acknowledged by them. It was resolved to write to the representatives of the "City Line" also on the subject.

Importation of Rubbish Tea.—A letter, dated 9th instant, from Mr. J. S. Hulbert having been read, the question of what could be done to prevent the importation of low class and adulterated tea was discussed and it was decided that inquiries should be addressed to the Customs' House on the subject.

Imposed Imperial Fiscal Federation.—A reply was directed to be sent to Madras promising to take up the matter when favourable opportunity presented itself.

KANAN DEVAN.

Minutes of Quarterly General Meeting held at Munaar Reading Room, 9th February, 1901. PRESENT:—Messrs. T. W. Schmid, L. Davidson, J S. Sealy (*Honorary Member*), H. E. Tollemache, W. M. Taylor, S. L. Robertson, W. D. Martin, G. H. Danvers Davy, J. J. Murphy, G. R. Whitby (*visitor*), H. L. Pinches, A. Angus, A. J. Wright (*visitors*), F. G. Tallet H. R. Quartley, C. Brander, R. Harley, C. G. M. Plummer, Baron von Rosenberg (*President*), C. Burn Murdoch (*Honorary Secretary*).

Notice calling the meeting taken as read.

The Death of the Queen.—After a few well-chosen words had been spoken by the Chairman, the following resolution was unanimously carried:—

"This Association joins its voice in the grief of the Empire at the death of its beloved Queen and humbly expresses its sympathy with the bereaved Royal Family and H. I. M. King Edward VII."

Minutes of last Meeting were then read and passed.

French Tariff.—Proposed by Mr. T. W. Schmid that this meeting supports the action of the Committee as expressed in the Chairman's letter to Mr. Ormerod, of 24th December, 1900.

New Markets for Coffee Fund.—Proposed by Mr. Davidson "That this Association supports the scheme of Messrs. Shaw & Langdale for pushing sale of coffee in France, and is of opinion that contributions to the scheme should be raised by an acreage assessment on the coffee area of the district." Seconded by Mr. Murphy and carried.

Reduction of Tea Duty. Proposed by the Chairman "That this Association do cordially support any action taken for the abolition or reduction of this duty on the lines recommended by Mr. Acworth, but that they would impress upon all those interested in tea that such action is more likely to meet with success if taken up and vigorously agitated for by shareholders and owners in England than by Planting Associations in this country."

Bridge over Kundale River at Munaar.—Resolved "That this Association thank the Sirkar for the grant of Rs.1,000 now allowed for the above bridge."

Roads.—Read the Chairman's letter of 12th December, 1900, to Chief

Engineer, Trevandrum, and resolved "That, if necessary, this letter be published in the *Madras Mail* and that this Association deplores the delay in answering an important communication of this kind, and that another copy of the letter be sent to the Chief Engineer with a request that he will give this pressing matter his early attention."

Tea Cess.—Indian Tea Association, Circular No. 5. The Chairman read the above circular and strongly supported the resolution contained therein and put it to the meeting, whereupon Mr. Davidson put the following amendment which was seconded by Mr. Tollemache and carried:—"That, subject to the names of the Committee being disclosed and subject also to the Company's or certain proprietors' approval, the resolution has our support."

I. T. A., Circular No. 6. The replies to queries were as follows:—

A. No.
B. No.
C. Plucking in these hills is already fine enough.
D. Yes: subject to confirmation by certain proprietors.

Transport Contracts.—Proposed by Mr. T. W. Schmid "That agents be advised that in future the rates for cooly hire from Boday shall not exceed 6 pies per 50 lbs. load per mile" Seconded by Mr. A. Angus and carried.

Labour Rates.—Proposed by Mr. Murphy "That next year, when agreements are being made for 1902, they shall be made out with the rate for men at 4½ annas." Seconded by Mr. H. L. Pinches and carried.

Volunteer Movement.—Resolved "That this Association congratulate the Volunteer Committee on the success of its preliminary endeavours in this patriotic movement and wish it a long and successful career."

Retirement of Honorary Secretary.—The Chairman proposed a vote of thanks to Mr. Burn Murdoch for his zeal and good offices as Honorary Secretary and expressed the Association's regret this his resignation of the Honorary Secretaryship meant his leaving the district as well, where he would be missed and regretted by everybody. Carried unanimously.

The following papers were laid on the table:—

U. P. A. S. I. Circulars, 3/01, 4/01, 10/01, 80/00, 81/00, 79/00, 75/00, 76/00, 78/00, 71/00, 72/00, 73/00, 69/00, 83/00.

I. T. A. circulars.

Planting Opinion, February 2/01.

Indian Gardening and Planting, 5 and 6.

(Signed) C. BURN MURDOCH,
Honorary Secretary, K. D. P. A.
(,,) B. V. ROSENBERG, *President.*

"KANDY DISTRICTS P. A." MEETING.

KANDY, *February* 16.

A meeting of those interested in forming a Kandy District Planters' Association was held at 10-30 this morning at Victoria buildings. There were 16 present. Mr. Gordon Pyper was elected Chairman and Mr. W. O. Secker, Secretary. Mr. Huxley proposed that Mr. E. Webb be Chairman of the Association. Mr. C. Gibbon seconded and this was carried. It was decided that the annual subscription should be R12-50. The following were elected to serve on the Committee:—Messrs. E. F. Rowsell, H De Sanctis, W. F. Murray, T. C. Huxley, R. Anderson, C. M. Fernando, Herman, C. Gibbon, Major Pain, H. Wills, F. H. Shelley, G. J. Murray, H. Stevenson, G. Pyper, L. Carey, J. B. Coles, and Chairman and Secretary *ex-officio*. Messrs. Pain, Gibbon, the Chairman and Secretary were elected to serve on the Parent Committee. The Chairman, Mr. Huxley and the Secretary formed a Committee to draw up rules. The Chairman, Secretary, and Messrs. Carey and Coles, to serve on the Labour Federation Committee. The Chairman at this stage proposed that the Asssociation be called the Kandy Districts Association and that they apply to the Parent Association to be affiliated. Mr. Secker was confirmed as Secretary on the suggestion of Mr. Coles. It was agreed that the general meeting be held on the second Friday in March. Papers were then circulated for signatures of those willing to be members, with the result that about 25 names were taken.

MARKET REPORT.

[*Per Mail advices 1st February* 1901.]

COFFEE.

The London Commercial Record says:—There continues to be a dragging demand, both the home trade and export shewing little disposition to operate, and in most cases prices have again been in favour of buyers, Colory Costa Rica of the new c however, met with competition at firm to higher rates a small shipment of fine Plantation Ceylon brought full va Further moderate supplies of new crop Neilgherry have att ed little attention, the better qualities being fairly ste whilst less desirable descriptions were very dull of sale at a de of 1s to 2s per cwt. The market for "futures" has at a been further fall, but at the close there is a recovery of 6d to 9d per from the recent lowest prices, which are still, however, below t current a week ago; yesterday's business comprised, March at 9d to 30s 4½d, May at 30s 3d to 30s 10½d, July at 30s to 9d to September at 30s 10½d to 31s 6d, and December at 31s 6d to per cwt. We quote:

London ...	Santos ...	March delivery ...	30s 3d.

TEA.

INDIAN.—Auctions were larger, including 59,800 packages against 1,300 packages previously, and 41,800 for the corresponding eriod of 1900.

Notwithstanding these full supplies prices were fairly maintained xcept in the case of common grades and parcels with plain nfusions which were generally easier. Quotations for the better escriptions, however, varied particularly for medium Broken 'ekoes, some selling well while others were neglected. Several lesirable invoices with a little cold weather flavour met strong ompetition, and higher rates were secured for them.

Duty payments have been on an increased scale for fear of a urther addition to the import on Tea. This unfortunately involves he temporary locking up of a good deal of money at a time when he sums to be found for deposits are considerable, and is having a rejudicial effect on the market.

For 50,000 packages on estate account 6⅝d per lb. was realised, compared with 7¾d per lb. for 39,400 packages, and 9½d per lb. for 38,500 packages in the two preceding seasons.

From the 1st to 31st ultimo, the following have been printed on Importers' account:—

1901.	1900.	1899.
239.400 pkgs.	244,000 pkgs.	221,100 pkgs.

making 1,115.000 packages of the 1900 crop disposed of to date against 1,146,000 packages in the same portion of 1899-1900.

CEYLON.—Public Sales were heavier, totalling 39,400 packages, (spread over two days) contrasted with 27,000 packages on the foregoing Tuesday and 24,100 packages in the twelve months before. Dealers were somewhat disinclined to add to their stocks for the reasons alluded to above, and much irregularity was noticeable in the bidding. Both leafy and brokens under 6d per lb ruled in favour of buyers, Pekoe Souchongs and Pekoes with poor cup often shewing a decline of ½d per lb. Medium to fine Pekoes and Orange Pekoes did not mark much change, being in many instances supported by outside orders, but Broken Pekoes from 8d to 1s per lb. were in less demand and the unattractive lots went easier. The proportion of finest and choice lines was again small.

The average has fallen to 6½d per lb. On the 24th instant it stood at 7d per lb., and rather over 7¼d per lb. in 190 0.

Quantity catalogued in January:—

1901.	1900.	1899.
146,000 pkgs.	137,800 pkgs.	110,000 pkgs.
(Avge. 6⅝d per lb.)	(Avge. 7⅝d per lb.)	(Avge. 8⅛d per lb.)

JAVA.—About 1,780 packages of direct import were submitted to the trade, which passed without spirit, and withdrawals were frequent in consequence of limits not being obtained.

For the 7th and 14th instant 2,000 packages have been declared. Offerings aggregated:—

1901.	1900.	1899.
8,800 pkgs.	7,700 pkgs.	3,900 pkgs.
(Avge. 5¾d per lb.)	(Avge. 6¾d per lb.	(Avge. 6¾d per lb.

Deliveries—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns are, *viz.*:—

From 1st to 29th January, 1901 ... ... 27,006,699 lbs.
Do. do. 1900 ... ... *33,270,376 „

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India ...	49,696	10,129	59,825
Ceylon ...	34,204	5,162	39,366
Java ...	724	1,061	1,785
Total ..	84,624	16,352	100.976

Also 232 packages from second hands.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon and Java Tea Report, dated February 1st, 1901, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1900-1901	1,150,176	865,536	38,669
1899-1900	1,216,076	826,660	40,989

60,328 *pkgs.* INDIAN
39,703 „ CEYLON
1.785 „ JAVA
} Total 101,816 packages were offered in public auction this week.

The Indian and Ceylon Associations are still engaged in endeavouring to promote joint action amongst growers with the object of restricting the output of Tea. At a Committee Meeting of the Ceylon Association held on Wednesday, the Report of the joint Committee restricting the output for the current season was approved and adopted, and a resolution passed asking them to give effect to the same.

The total exports from Ceylon during 1900 exceeded those of 1899 by nearly 19 million pounds, this heavy increase being accounted for by the extraordinarily favourable weather for Tea flushing, together with the copious manuring of some estates. The direct exports to markets outside the United Kingdom showed a very satisfactory increase, viz.:—

	1900.	1899.	1898.	1897.	1896.	1895.
Lbs. ...	34,671,446	25,946,032	23,635,238	17,124,508	14,205,051	12,186,532

A remarkable expansion took place in the Russian market, probably in part due to the trouble in China and partly to the unusually low prices. Australia also showed a satisfactory increase, while several of the less important countries have taken larger quantities

The uncertainty as to whether any alteration is likely to take place in the rate of duty is occasioning heavy duty payments at the present time, and buyers are on this account ready purchasers at the current low prices.

INDIAN.—60,328 packages were brought forward which, with the exception of 60,656 packages in January, 1900, was the heaviest quantity ever offered in London in one week. Quotations in Monday's sale were fairly well maintained for all except low priced descriptions, which sold irregularly and showed a decline of about ¼d per lb. In the later sales a somewhat easier tone was generally apparent.

Week's average of Tea sold on Garden Account 1901, 49,905 pkgs., av. 6·59d. 1900, 38,550 pkgs., av 7·71d.

Total Tea sold on Garden Account 1st June 1900 to date, 947,733 pkgs. av. 7·43d. 1900, 943, 878 pkgs., av. 8·39d.

CEYLON.—The heavy auction of 39,703 packages was only exceeded one week in August, 1899, which was after the refusal of buyers to purchase Tea on account of the draft dispute. The large quantity of Indian and Ceylon brought forward, aggregating together 100,031 packages, proved rather a strain upon the market, and prices for medium and common grades were easier to the extent of about a farthing per lb.

Average for week 6·40d, against 7·25d in 1900.

Ceylon Tea sold on Garden Account 1st January to date, 124,660 pkgs., av. 6·65d. 1900, 135,009 pkgs., av. 7·62d.

* This embraced one large payment in advance.

JAVA.—Sold slowly with poor competition, a considerable proportion of the offerings being withdrawn owing to bids not reaching the limits fixed.

Bank Rate 5 per cent. Exchange on London three months sight:—Calcutta 1/4¼. Colombo 1 4 9/32.

COCOA.

Large supplies were brought to the hammer on Tuesday, the total aggregating 8,989 bags; there was again a desire shewn on the part of importers to sell, and about 5,000 bags were placed at irregular prices. Of 1,051 bags Trinadad catalogued 720 bags sold at fairly steady values—superior red 84s, fine to very fine 70s to 72s 6d, middling to good 67s 6d to 69s 6d. Grenada, of which 4,039 bags were offered, declined 1s to 1s 6d, 3,000 bags selling at 67s to 67s 6d for fine, 65s to 66s for common to good. 91 bags Dominica mostly found buyers at 64s to 66s 6d for common to fine. 15 bags common Jamaica partly sold at 64s, whilst 32 bags St. Lucia half sold at 64s to 66s for common to fine. Of 808 bags Guayaquil only a few bags of Esmeraldas sold at 64s 6d. Of 371 bags Samana 170 bags brought 63s 6d to 64s. Ceylon was represented by 2,032 bags; Estate grown experienced active competition at very full to higher rates, but Native ruled in buyers' favour: 950 bags sold at 95s to 103s 6d for fine bold red, 83s to 90s for good medium and bold, 78s for middling ditto, 55s 6d to 66s 6d for small, and 63s per cwt. for Native.

COCOA POWDER.

At public sale on the 29th ultimo 9 cases English sold at 9d to 9½d, and 48 cases Dutch at 11d to 12½d per lb.

PEPPER.

BLACK.—The market was very quiet early in the week and values declined, but at the close the tone is steadier. On the spot about 1,000 bags Singapore have been sold at 6d to 6 1/16d for grayish and at 6⅛d for fair. To arrive 300 tons Singapore sold—January-March at 6¼d to 6 3/16d, February-April 6¼d to 6 3/16d, March-May 6 9/32d to 6 7/32d, and April-June 6¼d per lb.

At public sale on Wednesday 577 bags Singapore were brought forward and 494 bags sold—greyish and dusty 6d to 6⅛d; of 525 bags Tellicherry one lot good heavy realised 6 3/16d. 260 bags Alleppy, 32 bags Lampong, and 119 bags Trang all passed t hammer unsold.

WHITE.—Quiet, but steady. Fair Singapore on the spot sold 9¼d. and Penang at 8½d per lb. To arrive no sales reporte Singapore offers at 9 3/16d and Penang at 8 1/16d.

At auctions on the 30th ultimo 165 bags 14 cases Singapore we offered and 9 cases fine bold sold at 10½d per lb.

GINGER.

COCHIN.—Offerings were limited to 39 cases medium and sma rough cut slightly limed and 59 bags small to bold dullish roug partly shrivelled, which passed the hammer unsold at 47s and 3 respectively.

JAMAICA.—31 barrels were offered and 2 barrels lean medium a small brown washed sold at 32s per cwt.

CINCHONA.

A parcel of Crown bark offered and sold at 7d per lb. fo Huanoco quill (11 bales) and 1s 7d to 1s 8d for Loxa (11 bales), th latter figure showing an advance of 2d. Ten bales of yellow fla Calisaya were bought in at 2s, the limit being 1s 6d. The auctio to be held at Amsterdam on February 21 will consist of 5,426 bale of Ledgeriana and Hybrid, and 412 cases and 1,133 bales Succirubr The stock in first hands at Amsterdam on January 30 consisted 2,809 packages Government bark and 11,109 packages private bar including the quantity to be offered in the above-mentioned auctio The exports from Ceylon for the past five years have been—

	1900.	1899.	1898.	1897.	1896.
Lbs. ...	510,462	618,921	975,784	653,346	1,309,56

In 1900 the United Kingdom received 498,168 lbs., the remainde being divided between China, Italy, and Singapore. The shipment of bark from Java for January amount to 1,100,000 Amst. lbs.

QUININE.

QUININE has slightly improved its position in second-hands sinc last week, but the tone throughout has been quiet. Best Germa brands have been sold for March delivery at from 1s 1d to 1s 1¼d and on Wednesday there were still sellers at the outside figur May delivery has also sold at 1s 1½d, and June at 1s 1⅝d per o To-day business has been done at 1s 1d, spot, but the market close with buyers at this figure, but no sellers.

(AVERAGE FOR ALL INDIA 6·59d., FEBRUARY 1ST).

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first; As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to E. C. DUFF & CO., Proprietors, "Planting Opinion," 106, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 8th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Munzerabad.

Weather.—Blossom showers fell on Tuesday the 19th, and also on the 21st and 22nd, totalling altogether about an inch; they are very premature. Few estates are pruned out as yet, and could have waited for rain three weeks or so with advantage. *Works*—Pruning, manure and weeding. Prospects for next year are encouraging.

Coorg.

Polli Betta, 26*th February*. —*Weather*—continued cloudy till Sunday last with thunder showers in some parts of the country. It has since been clear with high East wind in the afternoons. *Crops*—Gleaning going on. The rain reported last week is bringing out a blossom on the Western side; over an inch was gauged. Where crops have been heavy this season, they will, of course, be short next season. *Labour*—sufficient. *General Health*—small-pox is still prevalent.

CEYLON AND THE TEA CRISIS.

Our last and present issues contain lengthy reports of the proceedings of the Annual Meeting of the Planters' Association of Ceylon. The chief subjects dealt with are of such great importance that we need not apologise for devoting considerable space to them. Yet we cannot but feel that much of that space may be regarded as wasted. The Ceylon planters have not dealt with the Tea Crisis as they might reasonably have been expected to deal with it. They have added nothing new to the arguments for or against over-production, and the only new statement we have observed with reference to the desirability of increasing consumption is a mis-statement. They have suggested co-operation with India while making remarks calculated to alienate the sympathies of Indian planters. They have advocated as

the only practicable course one that appears to us to be ridiculously impracticable. Perhaps, like ourselves, they have found that a multitude of counsels conduces to confusion and bewilderment, rather than to wisdom. At any rate, their decision leads us to suppose that wisdom has not presided at their Council meeting. Mr. Rosling, the Chairman, put forward an eminently "safe" resolution, *viz.* :—"That action be taken by this Association with a view to form a combination amongst Indian and Ceylon planters to cope with the present unsatisfactory condition of the tea market consequent on over-production." We allude to this as "safe" because, despite arguments to the contrary, we hold that present supplies of British-grown teas are in excess of demand. Unfortunately, Mr. Rosling attached to his resolution a rider that gives it an entirely wrong direction, *viz.*, the substance of the recommendations of a sub-Committee—"That action be taken by this Association with a view to form a combination amongst Indian and Ceylon planters to cope with the present unsatisfactory condition of the tea market consequent on over-production. That the sub-Committee considers that a combination with India having for its object the reduction of tea output is desirable. The sub-Committee considers that the only practicable scheme is an all-round reduction of the plucking area by 10 per cent. conditional on 80 per cent. of the cultivated tea acreage joining in the combination and on India joining on the same terms. If any proprietor prefers to make 10 per cent. of his tea crop into green tea, this shall be accepted in lieu of reduction of his plucking area by 10 per cent. That a sub-Committee be appointed to obtain adherence to the scheme above described."

It appears very unlikely that the required 80 per cent. will come to an agreement. If they do, it is still more unlikely that their agreement will produce benefit to anyone except some of the remaining 20 per cent. When Mr. Rosling remarked "My own personal view is that increasing the consumption is only a minor help to the reduction of production," he talked nonsense, while probably meaning sense. The most charitable view we can take is that he intended to say something like this : that efforts to increase the consumption would be only a minor help as compared with efforts to reduce production. How increase of consumption could help to bring about reduction of consumption, we fail to see. Then, again, the seconder, Mr. Sholto Skrine, scarcely took a business-like view of the situation when he remarked "We are, gentlemen, practically pushed into a corner. We ought to have the satisfaction, however, of knowing that our great rival, India, is pushed into an even closer corner than we are." The statement was neither just nor generous. Mr. Jas. Ryan was humorous, but scarcely discreet, when he said, "We have been treated very kindly in this matter by India. I am sorry to say that I regard this exceptionally friendly attitude of India with a very great deal of suspicion, and I regard it very much from the point of view of the school-boy, who, having received a large hamper from home, suddenly finds the 'bully' of the school wishing to lend him his knife to cut the string. When we were down, India treated us with a very considerable measure of contempt ; when we were beginning to develop a pretty little business by advertising and by taxing ourselves in a way that no other community in the world has ever done, India stood aloof, or made a sort of half-hearted attempt to compete with us and then retired from the business. Gentlemen, if we were to treat India as she deserves to be treated we should throw away scabbard, and fight them on their own ground, letting weaker go to the wall." This is exactly what we should l to see Ceylon do, for we hold that the interests of Ceyl and Indian tea-planters were *not* identical But if we w advocating co-operation between the island and the contine we should hardly do so in terms so well calculated to provo dissension.

With one remark of Mr. Rosling we were in full accor "if the time for combination is not ripe, it never will b It is not, it never will be. The time can never be ripe so gross an interference with the liberty of the individ planter as Mr. Rosling has advocated. The time can nev be ripe when tea-planters can defeat the real or suppos tious machinations of tea-dealers in England by reduci supplies. The time can never be ripe when tea can popularised by an increase of price to the consumer, or reduction of profit to the middleman. Tea-planters ha tried a fall with tea-dealers already, and have had the wor of it. This is certainly no reason why the former, seei that they are Britons, should not try again ; but it certain increases the odds against them. What planters have consider is cost and quantity of production ; price and exte of consumption ; cost and efficiency of means of distributio If they hope to improve the last by reducing the quanti produced, they will be disappointed. We believe that th view will commend itself to but few at present ; but, late it will be recognised that neither individual planters n collective bodies of planters can set economic laws at defian without incurring a very expensive lesson.

CHARITY !

"C. M. B. W." writes to the Ceylon papers :—How woul it do if all our planters would agree to send Russia this yea —not only as a discount on their last year's big order some 9,000,000 lbs., but as an advertisement as well—say 1 per cent. of our current year's crop, provided Governmen will carry it free to Colombo and ship it free of Cess, to b carried free in Russian steamer and handed over to th starving people of that country, duty free ? Don't you thin this would be a very good idea at this juncture, and help u by keeping a matter of, say, 1,300,000 lbs. tea off the Londo market, if all joined ? I cannot help thinking it would b the best and cheapest advertisement we could possibly go i for in that great tea-drinking country, as each estate's te would have its name on the packages. The tea should, think, be sent through the Russian Consul, Colombo, and b consigned to the British Consul, St. Petersburg, for distribu tion to the poor starving Russians. I'm quite willing t head a list and give 1 per cent. of my little crop, both estat and bought leaf." This correspondent's initials must hav suffered at the hands of the P. D. At any rate, "C. M. P. W —Charity Might Pay Well—would be more appropriate. Th idea of helping starving people by means of presents of te is a peculiar one, but it has been taken up seriously by ou

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nicho son's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf peopl unable to procure the Ear Drums, may have them free.

Address—No. 989 D, The Nicholson Institute, Longcott, Gunnersbury, *Londo*

[w. 26-5-00—26-5-1901.]

ombo contemporaries, and is even stated to have "attract-he attention" of the Russian Vice-Consulate in Colombo. e tea would be useless without "free freight" and "free ." A Colombo contemporary naïvely remarks:—"Tea is a good substitute for bread, but if used in the right way ld be a welcome addition to it." But—if there be *no d!* Free samples to richer people than Russian starving sants would be wise from an advertising point of view. m the standpoint of Charity, tea, alone, would scarcely egarded as very satisfying. Why try to blend "charity" "business" when, as is well known, Ceylon planters averse to blends?

BOARD OF TRADE RETUNS.

JANUARY, 1901.

mports, Consumption, and Exports of various articles ing the month of January are shown in the tables ow:—

Coffee.—The figures are discouraging, the accumulation of k being very marked.

—		1899	1900.	1901.
orted ...	cwts.	36,171	39,131	33,283
ne Consumption	,,	24,593	40,195	33,978
ort ...	,,	40,382	50,676	28,214
k ...	,,	282,000	264,000	300,000

Cocoa (Raw).—Stock has increased here also, but not in portion to the expansion of trade.

—		1899.	1900.	1901.
orted ...	lbs.	3,047,239	4,500,181	5,827,524
ne Consumption	,,	3,231,623	4,099,944	5,645,742
ort ...	,,	1,100,784	916,316	713,200
ck ...	,,	15,159,000	12,627,000	16,762,000

Cocoa (Prepared).—Home consumption steadily in-ases:—

—		1899.	1900.	1901.
orted ...	lbs.	433,437	515,109	687,585
ne Consumption	,,	517,323	513,413	584,411
ort ...	,,	105,685	73,730	52,210
ck ...	,,	1,123,000	236,000	372,000

Tea.—These figures are very unsatisfactory. A large rease in imports is but partially met by an increase in orts, while home consumption compares badly with nuary, 1900. There are, however, special reasons for this, d in fact the January 1901 figures are abnormally high her than abnormally low, in consequence of fears of a fur-er enhancement of duty. Stock is very heavy.

—		1899.	1900.	1901.
ported ...	lbs.	23,576,340	34,891,302	37,428,674

* It is understood that the bulk of this tea consists of transhipments for the United States and Canada.

Differential Duties.

Introducing the U. P. A. S. I. circular on this subject, the *British North Borneo Herald* remarks :—We ourselves do not, being uninterested in either tea or coffee, feel inclined to venture an opinion on such a very important subject, but we earnestly entreat those of our readers who, whether from experience gained in the cultivation of coffee or from a mature knowledge of planting in general, to be good enough to submit their views on the action that the Association has taken in the hope of bringing the matter, an eminently momentous one, under discussion.

* * *

The *Jamaica Daily Telegraph* says :—The action taken by the United Planters' Association of Southern India in consulting the leading Colonial newspapers, and the principal Chambers of Commerce throughout the Empire, will, we trust, lead to results beneficial to other interests besides the tea and coffee industries of India. Indeed, the covering letter of the Secretary of the Association to the *Daily Telegraph*, the resolution passed at the annual meeting of the Association, and the explanatory communication which we have received from the Chairman of the Association furnish pleasing evidence of an earnest desire for co-operation in a movement having for its object the combination of Great Britain and her Colonies and India against the world by means of a system of differential or preferential duties. The *Daily Telegraph* has been asked to give its opinion on the action that has been taken by the Association in bringing such a very important subject under discussion. We need hardly say that the course adopted by the United Planters' Association of India has our hearty approval. We have repeatedly and consistently maintained that if Great Britain and her Colonies and Dependencies are to hold their own in the fierce conflict with hostile foreign tariffs, a more or less uniform system of preferential tariffs must be adopted within the Empire, while a policy of free trade or judicious protection might be pursued towards foreign countries. Many months ago, we wrote : "The first practical step towards Imperial Federation must be a thorough re-adjustment of Imperial and Colonial tariffs. The arrangement would be as nearly as possible of the nature of a Zollverein, based upon principles of the free exchange of commodities within the Empire, but with the power to levy duty for revenue purposes and sometimes for protective purposes against foreign goods."

It is very gratifying to find that the opinions which we expressed some time ago were endorsed or echoed in the rectorial address which Lord Strathcona delivered to the students of Aberdeen University on the 18th of last month. The main subject of His Lordship's address was "The growth of Imperialism, and the efforts that are being made to bring about the consolidation of the Empire." After discussing the various plans or methods suggested for solving the problem of Imperial consolidation, Lord Strathcona said:—"The time might be not yet, but he felt sure it would come when Canada would trade with Australasia, with South Africa, and the United Kingdom on different terms than at present, when their commercial relations would be placed on a more friendly, or should he say, family footing. What the United Kingdom looked for was a predominance in the markets of the Empire; what the Colonies desired was the market of the mother-country and of Greater Britain for their products, which they hoped to see favourably regar —all other things, such as price and quality, being eq Such a policy could not fail to be beneficial to the Emp and his Lordship could not see any international reason militate against our regarding from a more favourable p of view our international trade as distinct from the exte trade ; or, our domestic trade as distinct from our fore trade."

Though there is all but perfect unanimity as to the d ability of the establishment of closer commercial relati between the United Kingdom and the Colonies and Dep dencies, no attempt has as yet been made to formulate a p whereby the object could be accomplished on a basis of p ferential tariffs. We need hardly say that an objection been raised to the proposed system of preferential tariffs the ground that it is a violation of the principles of f trade. It can be urged, however, on the part of the ad cates of the system that they do not wish to infringe principles of free trade but to improve free trade. It m also be contended that free trade is after all merely a pa cular fiscal system and not an infallible cult whose dogm stand in the way of commercial advancement and financ reform.

Among, the more serious difficulties to be overcome, w be the formation of a uniform system of the freest exchan of commodities within the Empire that will press fairly the United Kingdom and the numerous Colonies. In ma of the Colonies, nearly the whole of the revenue is deriv from taxation on British goods. The task that these Colon will have to face is such a re-arrangement of their fis system as will enable them to remit a considerable portion their import duties by substituting some scheme of interr taxation. The question on the English side that will have be answered is, will the manufacturers and consumers of t United Kingdom be prepared to place duties on the impo of foreign raw materials and foreign food? Despite t grave apprehensions of difficulty and trouble, we believe th the great fiscal problem will be successfully solved if t mother-country and the Colonies are prepared "to give a take." It is only by generous compromise and enlighten mutual concession that a grand intra-Imperial fiscal syste can be formulated and established.

We believe that the man who, above all others, is qualifi to accomplish this arduous task is the Right Hon. Jose Chamberlain, Secretary of State for the Colonies. While condemn the violation or infringement of the political cons tution of this Colony with which he is chargeable, we ha faith in his consummate ability and in his claim to be r garded as the best exponent of the grand idea of Imperi Federation and unity. We beg respectfully to remind hi of what he said, some four years ago, when presiding at t banquet held to celebrate the 29th anniversary of the foun ation of the Royal Colonial Institute. In advocating t promotion of a broad Imperial sentiment and the cultivati of a closer Colonial relationship. Mr. Chamberlain said th the Empire's rule over the Colonies was "*justified only their content.*" This is a broad, liberal recognition of Col nial freedom; but we fear that in the case of these We Indian Colonies we possess this freedom merely in name, n in reality. We do not believe that the Queen has in h globe-encircling dominions more loyal subjects than the i habitants of the British West Indies, or any that are mo ready to promote "the sentiment in support of the glorio

ditions of the country and flag." But surely it cannot be ected that any very strong feeling of content will be dis-yed by loyal subjects who do not get fair play in the rkets of the mother-country, and who are at the same e deprived of a portion of their political rights and erties. While we claim for these West India Colonies ter treatment, we need not say we are all in favour of a eme of Imperial Federation based on commercial recipro- and closer political union.

* * *

The Indian Tea Crop.

In their Circular of 8th September last the General Com-ttee of the Indian Tea Association, Calcutta, gave an imate of the outturn of the present Season's Crop of Indian a based upon the following figures :—

	Manufactured to 15th August, 1900.	Balance to be made to end of Season, 1900.	Total
	lbs.	lbs.	lbs
am	31,194,240	35,156,456	66,350,696
char	13,025,338	14,343,489	27,368,827
het	14,607,380	18,473,260	33 080,640
rjeeling	4.758,269	3,084,690	7,842,959
rai	1,392,028	1,150,720	2,542,748
oars	10,491,623	12,448,690	22,940.313
ota Nagpore ...	76,960	80,000	156,960
ittagong	391.041	483,345	874,386
ngra Valley ...	1,600,000	1,300,000	2,900,000
hra Dun	886,845	732,500	1,619,345
maon (estimate) ...	...	...	300,000
rdens from which no returns have been received, including Private and Native Gardens		...	16,168,000
		Total ...	182.144,874

The Committee have now given the following figures owing the actual outturn of the Crop as returned to them members of the Association.

Actual outturn of Crop of 1900.

	lbs.
ssam	67,928.770
achar	27,299,230
lhet	33,854,808
arjeeling	7.474.098
erai	3,378,075
ooars	29,997,065
hittagong	1,065,300
hota Nagpore	185.089
angra Valley...	3,000,000
ehra Dun	1,785,000
umaon (estimate)	300,000
ardens from which no returns have been received, including Private and Native Gardens (estimate)	11,260,000
Total ...	187,527,435

It will be noticed that the outturn from the Dooars District hows an excess of rather more than 7,000,000 lbs. over the stimate of September last. This excess is, to a large extent, n apparent one only. Owing to incomplete returns it was ecessary, when framing the estimate, to include about ,000,000 lbs. of Dooars Tea under the general heading of Gardens from which no returns have been received." This uantity has now been accounted for by the final returns rom Dooars Gardens, and is deducted from the estimate of 6,168,000 lbs. for "Gardens from which no returns have been received."

(Equals 8.364 English lbs.)

NOTES.

Coffee Leaf Disease. Regulations for North-Eastern Rhodesia, to prevent the introduction of diseased seeds, are published in African papers.

German Quinine. The export of quinine preparations, etc., from Germany during the eleven months ended November were :—

	1900.	1899.	1898.
Kilos.	170,600	195,600	180,000

Speculative Duty Clearances. A London telegram, dated 19th ultimo, says :—26,000,000 lbs. of tea have been removed from bond in London during the past ten days, in the expectation of increased taxes. A similar rush has been made on tobacco and spirits.

Colombo Tea Sales. The sale on the 20th ultimo passed off with a steady tone and with more active competition than has been experienced lately. It is satisfactory to note that the grading of many estate teas shows improvement, there being an absence of too dusty and flaky broken pekoes.

The Tea Crisis. The Indian Tea Association is forwarding to members of the House of Commons copies of a petition to Sir Michael Hicks-Beach, in which they state that the crisis in the industry is more acute and the output of Indian and Ceylon tea will possibly be reduced by 10 per cent.

Java Quinine. The exports from Java in September were 428 cases, of which 250 cases were shipped to the U K., and the remainder to New York. The shipments from July 1 to September 30 have been :—

	1900.	1899	1998.
Cases	825	562	396

Poor Teas. London advices, dated 8th ultimo, says :—Of Indian tea the public sales were again heavy, but there was a reduction in the quantity brought forward of Ceylon. Owing to the large supply of inferior tea prices were easier, but the best descriptions obtained full rates. The trade are said to be busily engaged in paying duty.

The Tea Industry. A public meeting of all interested in the Indian Tea Industry was held at the Bengal Chamber of Commerce on the 21st ultimo, at

3 P.M., to re-affirm the protest entered by the Indian Tea Association last year against the inclusion in the Assam Labour and Immigration Bill, now before the Imperial Council, of any provision for the enhancement of the wages of tea garden labourers.

Coffee in London.

London advices, dated 8th ultimo, state that coffee continues dull, the demand from the trade being limited—"Futures" have had a sharp rise this last day or two. Large purchases have been made of Santos by a New York speculator and quotations this morning were as follows, *viz.*, February 31s. 3d., March 31s. 6d., May 32s., July 32s. 3d., September 32s. 6d., and December 33s. per cwt., being about 1s. 9d. per cwt. above the lowest of the week.

Indian Tea Exports.

The following figures of tea exports, taken from the Calcutta Customs daily entries, are issued by the Indian Tea Association :—Quantity of tea entered for export to the United Kingdom for the first half of February, 1901, 3,311,246 lbs. ; quantity entered during the corresponding period of last year 2,175,289 lbs. Total from 1st April, 1900, to 15th February, 1901, 159,375,459 lbs. Total from 1st April, 1899, to 15th February, 1900, 148,326,789 lbs.

Ceylon Green Teas in Canada.

The *Canadian Grocer* remarks :—The "Salada" Tea Co. is in receipt of the following from H. Richardson, Grocer, under date of Carleton Place, January 22 :—

Sirs, I have sold out trial order of "Salada" Ceylon green tea, and all my customers speak well of it. Some of them say they will have no other if they can get "Salada" Ceylon green tea. It is this tea that will please Japan tea drinkers. Please send me as soon as convenient, 60 lb. brown label Ceylon green tea, and oblige.

Mr. Richardson got his first shipment on January 7.

Ceylon Tea for Russia.

It is asserted that the export of Ceylon tea to Russia this year is not going to be very large, this being accounted for by the fact that a great deal of inferior tea is being shipped, and many complaints as regards quality were received last year. The export of Ceylon tea to Russia last year amounted to 7,390,000 lbs. odd ; and this year there is expected to be an increase but not an appreciable one, and it is believed the total will be eight million or nine million lbs. at most and nothing over that.

The British Tea Duty.

A London telegram, dated 21st ultimo, states that the Indian and Ceylon tea-growers and distributors have petitioned Sir Michael Hicks-Beach to remove the additional tax of 2d. that was imposed on tea in consequence of the war in South Africa, and to equalise the scale of taxation on tea, coffee, and cocoa. Another telegram states that the speech of the Chancellor of the Exchequer has been taken in the city to mean that an increase of duty is improbable. Reuter's cabled version is misleading. The market is better.

Mexican Vanilla and Sarsaparilla.

Mr. Biorklund, the British Consul at Mexico, reports that an article which helps to confirm the opinion of the increase in agriculture in Mexico is vanilla. This bean, which in some parts of Mexico grows almost wild, is cultivated in the Southern States of the Republic, especially the State of Vera Cruz. The exports of vanilla in 1899 [illegible] 133,676 lbs., valued at £181,547, as against 59,034 lbs 1898, valued at £6[illegible],011. He goes on to say that the ex of honey and sarsaparilla is much larger than formerly, as neither require very much attention it is quite prob that they will become much more important.

Tea for Future Delivery.

The *New York Journal of C merce* says : "Trading in tea for fu delivery was inaugurated Monday morning. Comparati few members of the tea trade were in attendance at the op ing, and the business transacted was small. On the open call a sale was made by Mr. Max Meyer to Mr. H. Montgomery of 15,000 lbs. for February delivery at 13·3 in bond. Immediately after the opening call a second was made by Mr. R. C. Stewart to Mr Lester, of 15,000 l for February delivery at 13·50c., in bond. Shortly bef the close a third lot was traded in, Mr. Stewart selling to Meyer 15,000 lbs., for February delivery at 13·40c., in bo Total sales for the day were 45,000 lbs."

British-grown Tea in Vancouver.

The *Vancouver World* of a rec issue has the following : "J. Roberts, manager in British Colum for Messrs. G. F. & J. Galt, announces that they are n packing their own "Blue Ribbon" tea in this city, fr which western customers of the firm are hereafter to supplied. This is another industry which will greatly h Vancouver. As the Messrs. Galt control the output o number of the best gardens in India and Ceylon they en exceptional facilities for doing a tea business. Their hea quarters are in Toronto, but they have branches in Vancouv Calgary, Edmonton, Prince Albert, Brandon, Lond Hamilton, Ottawa, Montreal, Quebec, and St. John."

Tea-sweepings and Caffeine.

By a recent decision of the Unit States Treasury Department t sweepings (for the manufacture caffeine), when mixed with asafœtida, can now be import duty free. For a long time the Treasury Department declin to permit the importation of tea-sweepings under any class cation, holding that the Pure Tea Act excluded such m chandise, even though not designed for consumption as t Finally, a concession was made to the importers upon con tion that sufficient asafœtida should be mixed with the swe ings. The question then arose as to whether such a mixtu could be imported as a crude drug. The Courts have n upheld that it can, and refunds to a considerable amou will be made.

The Ceylon Tea Plantations Company.

The *Times of Ceylon* writes :—W learn on most reliable authority th the directors of our premier tea esta Company have by this week's mail sent out instructions lay fallow certain portions of their low-country estates. T has been decided upon quite irrespective of any joint acti that may be taken by growers generally to restrict output this way ; but it is an example which, it is hoped, will largely followed. It should certainly have an import beneficial effect in the right direction. The same Compan too, has already adopted more careful plucking on its pla generally. Example is better than precept ; and Mr. Ruth ford's advice to others has been followed up by prompt acti for the orders were despatched from London a fortni

fore it could be known whether planters generally would pport the proposed means of reducing the output.

e London Tea Market.

Messrs. Gow, Wilson & Stanton's cable, of 21st ultimo, to Colombo rerts that the market generally is steady, that for medium uoring Pekoes and Broken Pekoes showing a fractional vance ; while the market for Common pekoes and Broken koes is also steady. The price of fair liquoring Ceylon koe Souchong is 4¾d. (a farthing up) and the average ice of Ceylon tea sold on garden account this week was d. (three-eighths of a penny up)—as against 6½d. and 7⅝d. spectively in the corresponding week last year. Reuter ports that good to fine Ceylon teas are firm, and others iet. Pekoe Souchongs are quoted at 3⅝d. (three-eighths of penny down) and the average for the week at 6⅜d. (threeghths of a penny up) as against 6¾d. quoted for Indian tea. ,000 packages of Ceylon tea were offered for sale, of which ,000 were disposed of ; while of the 27,000 packages of dian tea offered only 21,000 found purchasers.

dian Tea in London.

A large business continues to be transacted in all grades, and with the ception of the common teas a steady but firm tone prevails, ys the *Produce Markets' Review*, of the 2nd ultimo. A rge and good assortment of the medium descriptions has en offered, several of the teas showing better quality, and there is an active demand prices are well maintained. ith every probability of a further increased business it is no means unlikely that a decidedly firmer market will evail later on, as the supply of these teas is not expected be in excess of requirements. Some of the finer teas, pecially from the Assam and Darjeeling districts, with utumnal flavour, were well bid for, and fetched high prices, hile these grades generally brought firmer values. On the her hand, although transactions have been considerable, the arket for the common qualities has been weak, and prices ave had a downward tendency, the quantity brought forward eing in excess of the improved requirements. At the public les 60,328 packages were catalogued, and only the comaratively small proportion of 9,450 withdrawn, most of which as since been disposed of by private contract.

he Patiagama Cinchona Co., Ld.

We are informed, says the *Times of Ceylon*, that Mr. H. M. Rowbotham, the well-known tea buyer of Melourne, Colombo, and Calcutta, has become the lessee of atiagama estate in Lower Hewaheta, the property of the atiagama Cinchona Co., Ld. The estate is not far distant om the once famed Loolcondura estate, the tea from which the earliest days of Ceylon tea had such a great reputation. here are 900 acres in all on Patiagama, and 223 acres of tea, ith no cinchona whatsoever. For the past ten years Mr. owbotham has spent as much time on board ship and in otels in circulating between Australia, Ceylon, and India as ny man alive, and he has at length wearied of the constant hange, and has purchased Patiagama with the intention of siding there a good part of the year. Mr. Rowbotham has ad much experience in planting, and in the early days of imbula did much hard work in opening virgin forest. It not now his intention to work the estate himself which will under separate supervision, but he will bring his good siness capacity to bear upon it, and intends to put money to it, and we fancy will make the place pay very fairly.

The London Coffee Market.

A continuance of receipts far in excess of anything expected caused further weakness in the terminal market, says the *Produce Markets' Review*, and prices declined about 1s. 6d., but an advance in some of the Continental markets led to more buying here, and the close is only 6d. under last week. As a consequence of this the demand, which had shown some improvement, fell off again, and the auctions towards the end of the week have been flat. A better supply of new crop Costa Rica, containing some of the finest marks, has been offered, and in most instances good prices were obtained, though establishing a drop of fully 20s. compared with the opening prices of last year The quality is, however, still below much of the last crop which is still offering, and holders of the latter are, therefore, not so anxious to sell as they were a month or so ago East India continues to come to hand slowly, and is of very poor quality ; there is little disposition to buy, and only part was disposed of.

Ceylon "Tea!"

A correspondent writes to the *Ceylon Observer* :—Just a line enclosing some extracts from the last local tea sale : 25,384 lbs. which ought to have been chucked away. Why do not Agents in Colombo give orders to Brokers to chuck away tea under 10 cts ? The most amusing in the whole sale list is the lot Tallegallakande red leaf packed in paper fetching *3 cts.* This will, I suppose, go to Europe and be sold as pure Ceylon tea !

Over-production.

We are afraid, observes the *London Commercial Record*, that the over-production and excessive buying have not been confined to Germany only, but the whole world has sinned in this respect. Let us point to coffee and tea alone. Brazil is literally swamping the markets with its production, and according to the phenomenally large receipts the crop shows no signs of exhaustion. As soon as the present yield has been gathered another enormous crop awaits picking and marketing. Stocks everywhere are very heavy ; no wonder, therefore, if prices incessantly decline, giving way under the overwhelming weight of Brazil sorts, and reaching a basis which not long ago seemed absolutely impossible. The coffee question is we all agree a very grave one, not alone to unlucky bulls or, holders

of spot stuff, they have their remedy, but also to the unfortunate planters. What is to become of the cultivator of fine coloury East Indian, for instance, if we continue to pay him starvation prices? How can he exist if our trade refuses to purchase his crop of decent coffee at over 45s. average, landed terms? Many of these planters, we are afraid, are not very rich people, and many, owing to a succession of poor crops, have nothing to fall back upon. Their estates will cease to exist, and fine coloury East Indian sorts, which we admire so much, will be a thing of the past. Unless consumers realise the danger and make up their mind to concede a fancy price for a fancy article, we shall have to educate our taste to a coarser coffee from which the delicious flavour of East Indian is absent. These pretty sorts have to a great extent, replaced the fine high-grown Ceylon coffees, which disappeared to make room for the all-powerful tea craze which expected to raise fabulous sums out of the old-fashioned coffee plantations. Tea gardens sprang into existence in Ceylon like the proverbial mushroom, with the result that tea was overdone, and, to-day, those that are interested in this commodity are trying to move heaven and earth to devise some means to put a stop to the ever-increasing cultivation of the article. Meetings have been held recently for this purpose, but from all we can hear nothing of any movement has been decided upon.

LETTERS TO THE EDITOR.

PRUNING.

Sir,—Would one of your readers favour us with an account of the best way pruning should be done after blossom showers?

Enquirer.

THE TEA CRISIS.

Dear Sir,—I have read with much interest the letters from the Hon'ble Mr. G. L. Acworth and Messrs. Thomson and Cooke in *Indian Gardening and Planting* of 14th February. While agreeing with much that they write, I cannot help thinking that something more practical is necessary for the complete combination of Tea Growers in Southern India.

Any scheme that will take from the London Market the large surplus of teas not wanted is acceptable.

There can be no good reason in Southern India for resting 10 per cent. of the Garden areas which is likely to be adopted in Ceylon when we have a market at our doors among the native population of the Madras Presidency. This market has never been properly exploited. Natives for many years have been regular drinkers of coffee, but of late the price of coffee has been prohibitive to the poorer classes and many have therefore turned their attention to tea, and I feel confident that there should be no difficulty in getting rid of 10 per cent. of our production, if properly worked.

I think therefore that this is a scheme that is worthy of attention, though I do not assert that it would be very remunerative at first, but would dispose of our lower grades without a loss and might eventually lead to profitable business when the taste for Tea is acquired and when the natives ha found out the relative cheapness of tea to coffee. In the ev of this scheme being tried and failing to take 10 per ce of the yield then the balance to be sold in Colombo Russia only. I am of opinson we should advocate—

(1) Compulsory cess on Tea shipped out of India

(2) Finer plucking (never more than two leaves unopened bud) going over the fields always within ei days, and April and May oftener.

(3) Exploit India with not less than 10 per cent. of yields or ship to Colombo to be sold for "Russia" only.

This, if properly carried out, would bring the desired res and improve the quality of our Teas

H. M. Knight.

GENERAL ARTICLES.

THE CEYLON CHAMBER OF COMMERCE ON THE TEA CRISIS.

The following remarks were made at a recent meeting the Ceylon Chamber of Commerce :—

THE OVER-PRODUCTION PROBLEM.

MR. ROSLING'S VIEWS.

The Chairman :—Gentlemen, I have now to ask Mr. Rosling kindly favour us with his views on the subject of which we ha heard so much lately.

Mr. Rosling, who, on rising, was cordially received, said :—M Chairman and gentlemen, I have to thank your Chairman ve much for his kind consideration in asking me to be present at yo meeting to-day. At the annual general meeting of the Planter Association, held on Saturday last, it was resolved :—"That acti be taken by this Association with a view to form a combinati amongst Indian and Ceylon planters. to cope with the prese unsatisfactory condition of the Tea Market, consequent on over-p duction;" and they added as a rider the report of the sub-Co mittee that had been appointed to enquire into the question. T report was :—(1) "That a combination with India, having for object the reduction of output, is desirable"; (2) "the sub-Co mittee considers that the only scheme practicable is an all-rou reduction of the plucking area by ten per cent., conditional eighty per cent. of the cultivated tea acreage joining in the comb nation and upon India joining on the same terms. If any propr tor prefers to make ten per cent. of his tea crop into green tea, th shall be accepted in lieu of reduction of his plucking area by t per cent."; (3) "That a sub-Committee be appointed to obtain a herence to the scheme." I do not propose to enter into the meri or demerits of the scheme, gentlemen. The object we have now view is to devise the best means of making that scheme an acco plished fact, and the first effort will be to approach the agen houses in Colombo. I understand that in the majority of cases t agency houses must refer the matter home, and I would sugge sending the following telegram, after this meeting, to the Chai man of the Ceylon Association in London :—"Rosling very anx ous to have Planters' resolution carried out. Colombo agen unable to act, waiting instructions principals. Steps must taken immediately. Ascertain at once and telegraph." If a gentleman is willing to come into the scheme and can contr acreage without referring to London, I shall be very glad receive his support; and if any Managing Directors or Chairm of local Companies can see their way to advise the shareholde that they propose asking for their support and consent to th scheme, I think that also will further the matter. I think th practically embodies what I wish to ask you, gentleme (Applause.)

A LOYAL ADHERENT TO ANY PRACTICAL SCHEME.

The Hon. Mr. W. H. Figg :—I am sure, Mr. Chairman and gentl men, I am speaking the mind of all present when I say that we a exceedingly pleased to meet Mr. Rosling, the Chairman of t Planters' Association, here this afternoon. (Applause.) This is t first occasion on which we have been addressed by the prese

airman of that important body and as for some years past we ve worked very harmoniously and have co-operated whenever could, it is an additional pleasure to see the Chairman of that dy down here in person. The matter about which he has spoken us is one which touches us all, more or less I do not think that I n rightly say that anybody is free from it, and whenever prosper- attends the tea enterprise we all share that success. I am sure at, if we have to face a reverse in the tea industry, that reverse ust affect us all, no matter what occupation we are engaged the island of Ceylon (Hear, hear.) That being the case, I am re we are all ready to give every consideration and support to any ractical scheme which may be brought forward for the ameliora- on of the present situation. I think we are taking a wise and ry proper step in telegraphing to London in order to obtain the -operation of the principals. For my part I am not prepared to y that I honestly agree with any particular scheme. It may be y misfortune, or that I cannot see so far as others. However, I n say that, so far as my personal interests are concerned and those hich I may be able to advise, I will loyally and gladly adhere to ny practical scheme which will commend itself to the majority of ne people interested in the tea industry. (Applause.) If we all act that principle, we shall, I think, in the end do some good. Of ourse, it is understood, and I believe Mr. Rosling will bear me ut, that the carrying out of the scheme proposed is absolutely on ne condition that India acts with us. I can only suppose that as ndia is in the same plight as regards the question of over-produc- on as we are, that she will be only too pleased to join in any cheme which is likely to do practical good to those concerned in ne tea industry. (Applause.)

VIEWS OF THE MANAGING DIRECTOR OF THE KANDAPOLA ESTATES COMPANY.

Mr. G. F. Traill:—Mr. Chairman and gentlemen, it appears to ne that we are face to face with a crisis, and that crisis has been rought about by the over-production of our staple tea. A scheme as been propounded and was carried unanimously at a meeting f the Planters' Association in Kandy, with the object of limiting he output of our staple. Without such a limitatien I believe that hat crisis will overtake not only many of us, but, possibly, the vhole country. I, personally, am very anxious that a scheme hould be settled upon. Never mind its merits or demerits. That can always be threshed out. Provided scheme can be unanimously decided upon, it can be threshed out and licked into shape by sub-Committees, Committees, and at General Meetings. If we unanimously agree to limit our output by 10 per cent., we shall be going a long way towards the removal of this crisis. So ong as we have 5 lbs. more than is wanted by the trade, the market will be extremely "wobbly." The moment we have 5 lbs. less than he trade requires, we shall have immediately a stiffened market. The moment we have a stiffened market, we have a panic amongst he buyers. The moment they are seized with panic, I take it, up go the prices. Supposing I send home 90,000 lbs. of tea at 7d., I take it, having worked it out most carefully, that I am very much better off than if I send home 100,000 lbs. at 6d. I slightly increase the cost of production, but that increase is certainly not more than 2 cents, and even then there would be a very considerabe increase in my income. And, if it would mean a considerable increase on 100,000 lbs., how much more would it be on 120,0 0,000 lbs.? I hope, therefore, that we shall combine in arriving at a condition of mind that will enable us to carry unanimously some scheme which may be licked into shape in the manner I have already suggested. (Applause.) As the Managing Director of the Kandapola Estates Company I undertake not only to rest 10 per cent. of my plucking area, but I will undertake to ship 10 per cent. less of black tea this year than I did last. (Applause.) And I will use my utmost endeav- ours with my principals at home to induce them to adopt the same line of action. Some people say at once with regard to any scheme brought forward that it is open to this objection and to that objection. A man may say that he cannot afford to throw away a single lb. of tea. My view is—throw away one lb. or two lbs., if it is necessary, and you immediately raise the tea enterprise out of the mud and put it back on its former prosperous basis. (Applause).

NO DISSENTIENT VOICE.

The Chairman called for any further remarks and re-read the telegram which it was proposed to send to London. He thought that the telegram conveyed the feelings of most of them, and he had no doubt it would receive the immediate attention of the Ceylon Association in London.

THE TEA-GROWING INDUSTRY.

The joint meeting of members of the Indian and Ceylon Tea Associations on January 23 was painfully blunt in its proceedings. For once in a way the members of the tea-growing industry divested themselves of the various phrases under which they had long concealed their thoughts, and frankly confessed that the problem of over-production in its worst form had to be faced. Ever since 1896 we, in this journal, have been dinning this unpleasant fact into the ears of tea-growers and directors of tea companies, but all to no purpose. When they might have stayed their hands they refused, and turning a deaf ear to caution, proceeded to lay out enormous areas in tea shrubs, to build huge factories, and to borrow heavily from bankers and agents in order to carry out these adventurous undertakings. Not content with that, Sir John Muir and his friends induced a large body of the British public to give them practically a blank cheque on the future by allowing a large amount of capital to remain uncalled upon the shares of the two big tea companies of the group.

The wild business done when every one went extending and inflating has produced its natural result, and in spite of the huge success in the way of increased consumption of British-grown tea in foreign countries, the home market is so congested with the larger supplies poured out from India and Ceylon that prices of tea are now at points quite unremunerative for the majority of growers. In the presence of this problem, to talk about the value of the rupee, the cost of home charges, and the recently raised duty is to play with puerilities, and it is well that the industry has ceased to deceeive itself in this way. All the same, we are not hopeful of the remedy suggested at the meeting, which is that growers by a self-denying ordinance, shall undertake to reduce the plucking area of mature tea by 10 per cent. provided producers agree to reduce their output by not less than 10 million lbs. for India and 8 million lbs. for Ceylon. In the first place there is something strange about this suggestion, as 10 per cent. of the tea output of India would represent at least 18 million lbs., and for Ceylon some 12 million lbs. Consequently a great number of growers will naturally consider that the figures aimed at will be obtained without reduction of their particular output. and, once it is recognised that growers can remain outside the ring with impunity, we are afraid few will be found inside that mystic enclosure. Then to attempt restriction in this fashion is only to draw together the edges of an unprobed festering wound. Years ago, in the palmy days of Colonel North, the nitrate trade of Chili was faced with a difficulty similar to that in front of tea-planters. There was at that time an excess supply of nitrate occasioned by the extravagant creation of joint stock producers. Restriction of output was at once proposed, and in that industry it was easier arranged than in many, as nitrate can only be obtained in the desert of Atacama. Accordingly, since 1889, there have been two, if not three, combinations with a view to the restriction of the production of soda in Chili, but the industry, as a whole, has not benefited by the arrangement. A few astute individuals and companies managed to reap profits from the self-denial practised by their neighbours, but the arrangements brought no prosperity to the over-capitalised companies. They have remained in an almost dividendless condition the whole time. seldom earning, one year with another, more than enough to pay working expenses, directors' fees, and office charges, so that their shares can now be purchased for a mere fraction of their nominal value.

This is the result of voluntary restriction of output in an industry particularly suited for such an experiment, and the difficulties in the way of a reduction in the output of tea must be much greater. The matter, in fact, requires a great deal more consideration than was devoted to it at the meeting last Wednesday week. For one thing, the Chairman, Mr. H. K. Rutherford, entirely ignored, so far as we can learn, the enormous area of young tea coming into bearing. According to the official figures issued by Mr. J. E. O'Conor, the immature acreage under tea in India at the end of 1899 was 82,082 acres, and if allowance is made, for the acreage which came into bearing last year, there must surely be an immature area of at least 60,000 acres still to come into full bearing. This, upon a low basis, represents 24 million lbs. of tea per annum for India alone, and one naturally feels inclined to say—What is the use of putting forth any manner of plausible scheme to compass a reduction of 10 million lbs. in the output when this young acreage is steadily coming into bearing?

No, the problem will not be solved that way. The difficulty has arisen through financiers, and we ought to allow it to be solved by financiers. Thanks to the efforts of people like Sir John Muir, an inordinate amount of capital has been attracted to tea-growing, and the only true remedy is to drive some of that capital away. Mr. Rutherford said at the meeting that restriction of output would bring back the confidence of financiers and bankers in the industry. Such an outcome is at the moment exactly the reverse of what ought to be desired. Those 60,000 acres of immature tea will never come into full bearing in their entirety, unless bankers and financiers lend money to weak companies, and it is precisely the weak companies that have the largest immature areas. Once let the banking loans and overdrafts to such concerns be withdrawn, and the area under tea in India will contract to an amazing extent. One need not be afraid that private enterprise will keep these plantations going, for numbers of them were only produced for company-working, in which shareholders should continue to provide money in one form or another without any regard to the profit that might be produced. Accordingly, we are not hopeful about the proposed policy of restriction, but it is a great point to find the industry confess that it has extended beyond the margin of prudence, and there may be more in the proposal than we imagine. For this reason we should like to hear the views of representatives of some of the stronger companies. It is they who will suffer most should the policy of restriction be put into force and prove a failure, and no doubt the answer to the question whether it shall be put in force or not lies with them. Many weak companies possibly will have to reduce their output in any case, from the simple inability to provide the money to pluck and cure the leaf; but the strong companies have resources and credit that will enable them to still carry out their operations. The question, however, must naturally arise with them. Why should we, who exercised prudence and moderation in the days of prosperity, make this sacrifice in order to save these weak, greedy companies from destruction? Surely some reason ought to be given in order to induce the strong companies to thus martyrize themselves, and, so far, we have utterly failed to find a forcible argument in favour of their adopting such a course.—*The Investors' Review.*

NOTES FROM BRAZIL.

(From the *Brazilian Review.*)

São Paolo.—The coming coffee crop in Lorena is estimated by the Municipal Agricultural commission at 11,725 bags.

At a meeting of *fazendeiros* in S. Paulo dos Agudos, a committee was appointed for the purpose of representing to the directors of the Sorocabana Company the urgent necessity of extending its lines to that place; the nearest point of the said railway being at present two leagues distant.

In Campos Novos de Paranapanema the coffee Crop for this year is expected to be well over 100,000 *arrobas*, owing to the large numbers of young trees that will come into bearing and which are flowering splendidly.

From Bebedouro come complaints regarding scarcity of labour which is becoming more and more noticeable. The ripening of the coffee is expected to commence very early this year, and gathering should begin in April. Thus the difficulties of planters will be greatly increased, and it is thought much of the coffee must be lost for want of hands. The writer advocates the introduction of Spanish immigrants not withstanding their being a little more expensive than Italians.

Exchange.—Extremes during the week ending January 11 were 9 3/4 9 29/32 d. for 90 d/s Bank paper and 9 25/32—9 15/16 d. for private.

The average Bank 90 d/s counter drawing rate for the week comes out at 9 51/64 d. corresponding sight rate being 9 47/64 d, against 9 13/16 d. the average sight rate of the *Camara Syndical.*

The average depreciation for the week, calculated on the basis of the Banks' sight rate, is 63.94% and the premium on gold 177.36% against 63.71% and 175.60% last week. At these rates.

Coffee.—Coffee prices though slightly under those of last year's are fairly maintained abroad, and the value of shipments during the past week, in spite of all, £16,100 in excess of the value for the corresponding week last year. The total f. o. b, value of coffee shipped to foreign countries from 1 July to 11 January 1901 is £12,589,336 as against £9,526,979 for the same period ending Jan. 11th, 1900.

A meeting of Coffee Commissarios has been called at the Cen Commercial to consider the interest of the class. We are inform that one of the subjects for debate is how to prevent exporting hou from buying direct from producers and thus intercepting their co missions. It is certainly rather hard on Commissarios who ha advanced money to planters on the crop, to witness with patie the crop passing into other hands without any settlement with the selves, but that only proves the necessity of altering the metho dealing with such dishonest clients. A radical change in the l that will prevent such things for future, would be far better. A how there are too many intermediaries in the coffee trade, and n that profits are coming down to bed-rock one or other of them bound to go. It will certainly not be the Exporters, so the choic limited to Commissarios or Ensaccadores. Probably the latter.

As regards the coming crop there is nothing new to add exc that everything tends to show that estimates of eleven million ba upwards will not prove exaggerated, the constant rain and m weather now ruling being favourable to the development of t berry, though it is possible some may fall off and be washed aw

NITROGEN-FIXING BACTERIA.

Besides the nitrifying bacteria which are able to transfer amm nium salts found naturally in soil, or have been added thereto in other nitrogenous compounds, a number of related organisms a met with in many fields which have the power of utilising the fr nitrogen of the atmosphere and drawing from this vast store of a most inert gas considerable quantities for plant-food. These a the nitrogen-fixing bacteria.

On the rootlets of many higher plants, more especially on tho of the *Leguminosæ*, small nodules in varying numbers are fou produced by and filled with bacteria. It is supposed that by t *symbiosis* (a living together) of these lowest forms of plant-life wi the higher plants, the latter derive the nitrogenous food which it proved cannot have been derived from the soil, and, therefore, mu have been obtained from the atmosphere. The process is not y properly understood, but the general opinion tends towards the a sumption that the bacteria fix the free nitrogen within the nodul and that the resulting nitrogenous compounds are assimilated b the host-plant.

By some also it is thought that through the peculiar conditio of "living together" the plant is enabled to fix free nitrogen its foliage.

Whatever may be the correct theory, the effect of this remarkab interaction between the low forms and the higher plants is ve striking and very variable in extent. Even amongst the *Leg minosæ*. the plants deriving the greatest advantage from th *Phenomenon*, extremes are met with; some deriving apparently b little benefit from it, whilst on the other hand, many may ve largely depend upon it. Amongst the Lupines, for instance, th yellow flowering variety is able to entirely dispense with nitrog nous substances in the soil.

Through the exhaustive investigations made first by Professo Hallriegel and Wilfarth, and later by Lawes, Gilbert, and others, o nearly all the cultivated leguminous plants, no doubt has been le that the nodules found on the roots are formed through bacteria a that these are able to fix free nitrogen for the use of the pla they attach themselves to. Until Hallriegel proved that th presence of bacteria is necessary to enable plants to utilise th nitrogen of the atmosphere, and that, for this reason, *Legumino* may almost entirely dispense with nitrogenous manuring of th soil they grow upon, and, in many instances, even enrich the la with nitrogen, these observed facts were not properly understoo

It was well known in practice that clover and lucerne would gro vigorously for a period of years without being manured, and wh flagging, could often be invigorated by a dressing with gypsu This tends to prove that these crops did not sicken for the want nitrogenous food, but on account of other elements becoming e hausted or unobtainable for some reason from the soil.

A palpable proof that the help of bacteria is almost absolute necessary to enable plants to assimilate atmospheric nitrogen, afforded by the fact that seedlings, say, of peas, will not thri

less the soil contains at least some traces of nitrogenous compounds; but as soon as they have made a start and have sent out otlets upon which the bacteria can form colonies, they prosper dependently of the presence of this food in the soil.

During the experiments carried on in several German agricultul establishments it was discovered that every species of legume as associated with a specially sympathetic bacterium which would ot perform the office of fixing nitrogen for other species. Based on the acquisition of this knowledge, Professor Nobbe, of Thard, in Saxony, is now preparing a number of pure cultures of ese specific bacteria for the purpose of sowing them together ith their respective culture plants. These cultures are placed on e market under the name of *Nitragin*, and for some time have een undergoing and still undergo practical tests regarding their ficacy of promoting the growth of plants.

It has not been definitely ascertained how long these artificial ltures can retain their vitality unimpaired; and besides, in some stances, adverse seasons have prevented a definite judgment eing arrived at as yet, whether the results obtained in trial plots an be maintained on a larger scale in the field. Considerble attention is being paid to this question at the agricultural ations in Germany, as well as in the United States, and elsewhere.

THE DENITRIFYING BACTERIA.

In addition to the organisms hitherto referred to, all of which re pre-eminently friendly to plant-life, and thus indirectly to man, here are a host of other bacteria met with in soil and water which lay an important part in connection with agriculture.

Their action is to reduce the compound organic substances into ss complex combinations, or into simple elements, and in this anner make them again available for plants to which otherwise ey would be lost, as these can utilise nothing but elements or mple compounds for their nutrition.

It is manifest that were it not for the decomposition of the many mplex substances taken from the earth in the shape of plants and nimals, after these have changed from the active state called life, o that of inactivity or death, and by this process are re-dissolved eriodically, these substances would be entirely lost to succeeding enerations of plants and animals, and this constant drain from the esources now found on the surface of the globe would ultimately xhaust their supply and make life impossible.

That putrefaction and other processes of decomposition are proced by bacteria was suspected for a considerable time, but this as not definitely proved till 1875 by Menzel and subsequently erified by others. The action of these organisms is so variable hat in the decomposition of any given substance probably a dozen pecies participate.

From this indisputable achievement of scientific research it will e seen that it is in the first instance entirely due to the activity of he minutest organisms that what is of earth goes back to it again y the dissolution into simpler substances of the complex and ntricate combinations. Chemical action, no doubt, has also much o do with the re-dissolution; but it is now accepted that this ctivity in the generality of instances is secondary to the bacterial, nd takes place after these have broken up the compounds.

Without the one process the other would not take place, and rom this it is evident that micro-organisms are more closely onnected with the productiveness of the soil than was dreamt of ess than thirty years ago, and that not only in medicine and ndustrial pursuits, but also from an agrinomic point of view bacteriology is becoming daily of greater importance.

The organisms intimately connected with the fertility of the soil hay conveniently be divided into two groups, namely, assimilatng and destructive bacteria.

Under the first group we would classify the nutrifying and the itrogen-fixing bacteria; and in the second all species which cause utrefaction and decomposition may be included

The first group, as previously stated, includes nothing but eneficial species which are occupied either in building up nitrogeous compounds in the soil, the nitrifying species, or in fixing itrogen, from the atmosphere the nitrogen-fixing bacteria the atter of which, besides assisting plants to use this element, frequently also enrich the soil itself. Important as is the numerous econd group on account of the reducing power of its species, it ncludes several that act disadvantageously in regard to agriculture.

These objectionable species are the denitrifying organisms. By denitrification is understood the deoxidation of nitrates and nitrites, which in each case involves a loss by either nitrogen or ammonia being given off. Their activity is perceptible by the pungent smell of ammonia rising from fresh stable manure, particularly from that of horses. Nitrogen being odourless, its loss cannot be perceived by the senses; it nevertheless takes place to some extant during every process of decomposition where nitrogenous compounds are present.

THE AIMS OF SOIL BACTERIOLOGY.

It now remains to indicate the aims of bacteriology in connection with agriculture. These are shortly as follows:—

1. To encourage a definite multiplication of the nitrifying organisms found already in the fields, by adding substances that will enable them to retain their vitality and vigour after their activity ceases for the want of nitrogenous material; and in case of their absence from a soil to transplant them thereto, if this can conveniently be done, by adding soil impregnated with the desired bacteria;
2. To secure by the growth of plants favourable to nitrogen-fixing organisms an enrichment of the soil by nitrogenous compounds; and
3. To counteract the sudden and excessive development of the denitrifying organisms, in order to prevent loss of fertilising substances by means of these latter.

THE DISPLACEMENT OF CHINA TEA.

In his book, entitled "The Englishman in China during the Victorian Era, as illustrated in the career of Sir Rutherford Alcock, K.C.B., D.C.L., many years Consul and Minister in China and Japan," Mr. Alexander Michie, author of "The Siberian Overland Route," Missionaries in China," &c., refers to "Flavoury Ceylon leaf" in contrast with "the rougher qualities which come from India," and remarks :—

The Indian and Ceylon Planters have made a personal study of all the conditions of tea culture, have selected their plants, invented machinery to do all that the Chinese have done for centuries by manipulation, have put ample capital into the enterprise, and used the utmost skill in adapting their product to the taste of their customers. Moreover, they have by dint of advertising all over the world, attending exhibitions, and many other devices, forced their commodity into markets which would never have come to them There was, on the other hand, no one interested in the success of Chinese tea growers, whose plantations are in the interior of the country, subdivided into garden-plots, with no cohesion among their owners for aggressive purposes. For though the Chinese can and do combine, it is usually in a negative sense, to obstruct and not to promote action, whereas the tea-growers of India have shown examples of intelligent co-operation of the aggressive and productive kind, not wasting power in seeking to impede rivals, but devoting their whole energies to the prosecution of their own business. And they have their reward.

The short-sightedness of the Government has no doubt contributed to the decline of the Chinese tea trade, through the excessive duties of one kind and another which they have continued to levy on the article from the place of growth to the port of shipment. It is fair to remember, however, that their exactions bear most heavily on the low grades, which, notwithstanding, continue to be shipped in quite as large quantities as is desirable in the interest of consumers; while the superior qualities, which are not quite able to bear the taxes, have almost ceased to be imported into Great Britain, the whole supply finding its way to Russia. That country has long been celebrated, and justly so, for the excellence of its tea, for which fantastical reasons are wont to be given. The true reason is very simple. Russian merchants purchase the fine Chinese teas for which no market can now be found in England, the public taste having run so exclusively on the product of India and Ceylon that a cup of good Chinese tea has become a luxury reserved for those who have facilities for obtaining the article outside the ordinary channels of trade.

SUPPOSED DEFRAUDING OF A PLANTER.

A correspondent of the *Times of Ceylon* writes :—

A case of considerable interest to the planting community has been instituted in the Police Court of Hatton by Mr. R. H. S. Scott, of Ottery estate, Dakoya. It appears that one "Ramasamy" describing himself as a kangany of Mathurapaestate, Kadugannawa, came to Mr. Scott and asked for an advance, promising to give him a number of coolies who were said to be under him on Mathurapa. Mr Scott accordingly wrote to the proprietor and sent him a cheque for R905·25, requesting him to send the coolies, but Mr. Scott has neither received the coolies nor a refund of the cheque. Below is the statement of Mr. Scott, the further hearing of the case having been postponed till the 28th February :—

Mr. R. H. Scott, sworn said :—I charge Ponnasamy Pulle, of Mathurapa estate, and Ramasamy kangany, who describes himself as being on that estate, but who is not on that estate. Ramasamy kangany came to Ottery from Kadugannawa some time prior to 19th January, and with him came Sinnaiya, one of my kanganies. Sinnaiya handed me two *tundus* which I produce, signed by R. M. Ponnasamy Pulle. On seeing these *tundus*, I wrote to Ponnasamy Pulle asking if it was convenient for him to pay the coolies off, and whether he would allow my kangany to go and inspect them. He sent me a reply saying he had allowed my headkangany to see the coolies. I think I sent the letter by my kangany. Two of my kanganies went, they returned and reported that they had seen one gang of twenty-four coolies and one kangany, and another gang of seven coolies. I thereon gave a cheque, probably to my kangany, for R905·25, being the total of the two *tundus*. They went to Kadugannawa on the 20th ultimo with the cheque. They did not return till 26th ultimo. They brought no no letter or coolies. On my questioning them they said Ponnasamy Pulle had said that the cheque I had given was wrongly dated and he could not cash it. I turned up my pass-book, which I had received from Colombo that night, and I found my cheque for R905·25 had been cashed on the 21st in Colombo. My kanganies said they had been pushed off the estate, and no coolies had been delivered to them. I sent my conductor down to Ponnasamy Pulle with a letter about 27th ultimo, requesting him to refund the money or to send the coolies. The conductor brought back a pencilled note from Ponnasamy Pulle saying that he had paid off the coolies, and knew nothing about the matter. The cheque was made out in the name of Ponnasamy Pulle.

THE PLANTERS' ASSOCIATION OF CEYLON.

We give below comprehensive summaries of the chief speeches delivered at the Annual Meeting of the Planters' Association of Ceylon. Some of them deal with subjects of very great interest to South Indian tea-planters.

CHAIRMAN'S OPENING REMARKS.

After the annual report had been laid on the table the Chairman said :—Gentlemen, the past year has been one of anxiety and trouble for many and the present position is one that demands our closest attention. Partly owing to over-production and partly to the increase in the British Import duty on tea, the price paid for our product has fallen to a lower level than hitherto known, and unless relief is afforded at a reasonably early date proprietors of the poorer classes of tea property must be ruined. As regards the estimates for the current year the Committee feels that with the probable reduction in the output through fine plucking and other causes it is better to get the present estimates revised before publishing them and this we hope to do by next month. I may say, however, that everything points to reduced shipment to the United Kingdom as compared with last year (Applause.) The result of the 1-lb. draft dispute, *viz.*, taring to the ½ lb. came into force from the 1st June, and I think gentlemen we reasonably congratulate ourselves on the result of the practical working of this compromise. All the evidence goes to show a reduction in loss in weight of ½ per cent or a clean saving of at least a quarter of a million rupees per annum to the Tea Industry. A small reduction has also been effected in warehouse charges, but they still amount on an average to over 2/ per package or m than it costs at present to send Tea from Colombo to Lond During the year the Association approached Government with view to obtain a reduction of railway rates by having tea pla from the fourth-class, into the sixth-class, but this, Governme was unable to agree to and Mr. Campbell has a motion on t subject to bring forward to-day bearing on this subject Labo appears to have been plentiful throughout the year in almost the planting districts and the Labour Federation would appear have worked satisfactorily. In July Government wrote renewi their offer of R22,000 for the removal of the Tea Kiosk and t Association having come to terms with their tenants, the Ceyl Tea Co. decided to accept the offer. In another month or two t Kiosk, in its present position at any rate, will be a thing of t past. The Benevolent Fund continues to receive the well-merit support of a certain number of our community, but I would li to see that support largely extended. During the year we receiv R3,400 subscriptions and donations and R1,056 interest on inves ments, our disbursements being R1,420. The capitalised fund the present moment amounted to R35,000, the interest from whi is utterly inadequate really to perform any useful work. Th fund came in for a good deal of criticism in the early part of t year and in December a general meeting of the subscribers w held to see if it were possible to increase its usefulness. The criti and conscientious objectors who asked for this meeting we singularly conspicuous by their absence (Laughter). Gentlemen would ask your continued and increased support to this Fund a also to the institution, somewhat allied to it, the Hat on Nursi Home. It is only some 13 months ago since we despatched o Contingent to the war in South Africa, some alas never to retu while all have suffered privation, sickness, and hardship in eve conceivable form. Our Contingent you may say has been co tinually at the front and has borne the heat and burden of the da as part of the finest fighting force in the world, and I think we ca well feel proud of our Contingent. (Loud applause.) I fear w gentlemen, now the war has dragged on so wearily and the novelt and glamour have worn off that we are too apt. I will not say forget, but not to remember so vividly our brothers at the fron And if it is possible to send a Relief Contingent down to allo those men to come back, I think if the men can see their way to d it, we should do it. (Applause.) A year ago I was able to announc the formation of a Rifle Corps with a promise of 235 member To-day, gentlemen, there are nine new ranges in existence, tw projected ranges, and 372 enrolled men or including the Colomb and Nawalapitiya Rifle Corps and the Ceylon Mounted Infantry total force of 600 men with a working knowledge of the rifle. think the events of the past year show how necessary it is tha every able-bodied man should possess that knowledge. (Hea hear.) Before leaving the question of the Rifle Corps I should lik to say that the success of this movement is entirely due to th energy and zeal with which Mr. Campbell has approached tha work. (Hear, hear, and loud applause.) I do not want to detai you long for we have a big agenda to get through, but I should lik to refer to a subject which is of the greatest importance to us all- the work of the Thirty Committee. In America our work durin the last year has been very up hill. Anticipating a shortage supplies from China owing to the troubles there, American deale indented for double their requirements and unfortunately the orders were executed in full; this, together with the war duty 5d. per lb. has had a bad effect on our teas; but I still maintai that the American market for our Black and Green tea is the o we must look to for further relief. On the Continent you hav been kept fully advised through the Press as to the work o Commissioner was undertaking there. The Ceylon Tea House the Paris Exhibition was an immense success, and I am glad to b able to say that a Tea House has been opened by private enterpri in a fashionable part of Paris to continue the good work com menced. In July last the Thirty Committee voted R120,000 as bonus on the manufacture of 2,000,000 of Green teas to come int force when the original vote of R30,000 was exhausted We a at present shipping about 150,000 lbs. a month, but with the Gree Tea market like all new markets for products it required time develop, and I do not think that we can look for immediate reli either from Green tea or from the present market. Roughl speaking we are spending £8,000 this year in America, £8,000 the Continent, and £8,000 on Green teas. I think, gentlemen, th that practically sums up the amount of work that we have g

rough during the past year, and I now formally move the doption of the report.

Mr. J. P. Ryan:—May I ask if we are spending £8.000 on Green a this year?

The Chairman:—The bonus required is £8,000.

THE OVER-PRODUCTION QUESTION.

The Chairman:—The next business on the agenda is the resolu-on which stands in my name; "That action be taken by this ssociation with a view to form a combination amongst Indian and eylon planters to cope with the present unsatisfactory condition the tea market, consequent on over-production." In framing is resolution I purposely left it indefinite as the matter was being onsidered by a sub-Committee that had not been able to meet before hat sub-Committee met on Thursday and issued its report. That eport was accepted by the General Committee this morning and ith your permission I will add that report as a rider to my original esolution. The resolution would then read as follows:—"That ction be taken by this Association with a view to form a combina-ion amongst Indian and Ceylon planters to cope with the present nsatisfactory condition of the tea market consequent on over-pro-uction. That the sub-Committee considers that a combination ith India, having for its object the reduction of tea out-put, is esirable. The sub-Committee considers that the only practicable cheme is an all-round reduction of the plucking area by ten per ent, conditional on 80 per cent. of the cultivated tea acreage joining n the combination, and in India joining on the same terms. If ny proprietor prefers to make ten per cent. of his tea crop into green ea this shall be accepted in lieu of reduction of his plucking area y ten per cent. That a sub Committee be appointed to obtain ad-erence to the scheme above described. With your permission I ill add that as a rider to my resolution in order to give it definite hape, and any gentlemen will be at liberty to move an amendment o that resolution. In dealing with the present position of over-pro-uction there appear to be two roads open for working a cure:—one y reducing the production, and the other by increasing the consump-ion, and either scheme must have one or other of those views in it. My own personal view is that increasing the consumption is only a minor help to the reduction of production. From the experience f past years in the "Thirty Committee" those who have served on hat Committee know how hard it is to force tea into new markets. When India first began to try to push Indian teas in America it did so y sending tea for shipment that could be sold at anything they could et. They thought that if the Americans could get tea cheap enough hey would take it. The result was that the tea was bought, shipped, ack to London, and did not get into consumption. Working on hose lines we have always met with the same experience. First of all ou have to get the taste for the tea, and at the same time have nachinery for getting that taste supplied. I fail to see any im-nediate relief from any increase of consumption either on the Continent or America or from making green teas. We shall doubt-ess have relief in the future and if we continue to develop the markets in the way that we have been developing them in the past, I fully believe that we shall get appreciable relief at the same date. But, gentlemen, we want relief to-day. Bearing on the subject I nave received by the courtesy of the "Times of Ceylon" a copy-right press message:—"Market demoralised. Trade money locked up in speculative duty clearances." In other words, gentlemen, that class of man who has come to our assistance, the buying-over broker who brought speculatively if filled up. In other words up to the present moment, so far as we can see, we have absolutely no outlet for that 25 millions of stock which we carry more to-day than we had two years ago, and so long as that 25 millions remains as an incubus on the London market I fail to see how we can look for any real material relief of the present disastrous position. The objections that have been raised to the resting, I won't say abandoning, of 10 per cent. of the cultivated acreage, comes, I think, chiefly from men who at the present moment are working still at a profit. I believe that many men would prefer to have a small certain profit than a possible larger one if it entailed no form of new departure. Well, gentlemen, we have got to-day to decline one thing or the other—we have to sit still and allow ruin to come upon many of the poorer proprietors or else we have to live up to our motto and combine with the view of reducing the growing pro-duction. We know that the London dealers, the buyers, and the whole trade, are watching this movement with the keenest eye, and we know that if we fail to combine to-day they will use that know-edge to depress prices still further. We also know that we have the London proprietors at our back and that India is anxious to go in for any feasible practicable scheme. (Applause) I think that if the time for combination is not now ripe it never will be. (Applause.) Gentlemen, I move my resolution in the form pub-lished, *plus* what I stated at the outset.

MR. SHOLTO SKRINE'S VIEWS.

Mr Sholto G. D. Skrine, who was received with applause, said:—Mr. Chairman and gentlemen, I thank you for the kind way in which you have received me after my absence from Ceylon. I come here to-day, at one of the most critical periods in the tea industry, to second a motion in which I have absolute faith. (Applause.) And a motion which I believe in my own mind is the only practi-cal way in which we planters can save our industry from some-thing that looks very much like ruin. It is, gentlemen, an un-doubted fact that unless we do something now when the opportu-nity is afforded us we shall never get this opportunity again. We are, gentlemen, practically pushed into a corner. We also have the satisfaction, however, of knowing that our great rival, India, is pushed into an even closer corner than we are. (Applause.) That being the case we have an opportunity of, at all events, forming a combination on the lines that have been carried out by

THE COAL OWNERS IN ENGLAND,

who not very long ago found themselves in quite as tight a corner as the Ceylon tea industry does to-day. They did not sit still and do nothing. They did not sit still and allow the trade to take their coal for nothing They combined as we are endeav-ouring to combine to day, and by that combination they succeeded in putting their product in a reasonable position in the markets of the world. Gentlemen, all we have to do is to follow that example. The difficulties, no doubt, are great, but it is the duty of Englishmen and still more the duty of planters, to meet difficulties and overcome them. (Applause.) In my opinion there are not wanting signs that the whole of the community has grasped the position of affairs and that the output of tea will naturally be reduced very largely by our own action, but in my opinion that action will not be sufficient to have any material and lasting effect on the market unless we, show that we who represent capital in the East, are prepared to put shoulder to shoulder and do something practical which shall restrict our output and take away from the middleman the exorbitant profit that he has been raking in. (Hear, hear, and laughter.) It is perfectly well-known in London and everywhere else that for the tea for which they are giving us 5d. to 4d. to-day they could very well afford to give us 8d. and still make a material profit on it. It stands to reason that they are not going to give us more than they can possibly help, and it is our duty to try and make them give us a legitimate price for a really good article. The estimates which have been sent in to the Association, have, I consider, and the Com-mittee considers, been based on practically the yield of last year, and I feel that, very prudently, we have decided, before pub-lishing these estimates to the world, to have them revised so as to be able to give a reliable estimate and one which the London markets may look upon as having been derived from reliable data. In a question such as this, I think, we all ought to sink our minor differences and do our utmost to unite, even though we may not be all agreed. There are, I am perfectly aware, a large number of estates which, even at the present moment, are showing considerable profits, and the proprietors of which will turn round and say, "Because at the present moment it is paying us, we do not see why we should be mulcted in order that men who, in our opinion, opened land which they had no right to open, should be allowed to profit." That, gentlemen, in my opinion, is a false argument. It is an un-sound argument. It is not a fact that they are going to continue to rate their profits. There are heaps and heaps of estates which up to now have been plucking coarsely, encouraged by the price given for coarse teas. These estates may not produce quite so good an article as those which are now so flourishing, but by plucking fine kinds, going in for making fine teas, there is very little question that before very long they will compete closely with those high-grown teas and reduce the profits of those estates very materially. For that reason, gentlemen, I consider that high estates ought not to adopt a dog-in-the manger policy, or leave their brother-planter alone and go simply for the survival of the fittest. (Applause.) I hope that at this meeting we shall be unanimous and that we shall be prepared to carry this motion, which has been so ably proposed by the Chairman and which is based on conditions which ought to make it, in my opinion, acceptable to

all. It is not proposed to carry out this motion unless 80 per cent. of the Ceylon area and also 80 per cent. of the area in India will combine and help us. If this is done there will be no doubt that it will bea material combination which will awaken the London market to the fact that planters can unite, and I maintain that it is for the benefit of us all that this motion should be carried unanimously. (Applause.)

Mr. J. A. Martin:—Mr. Chairman and gentlemen, with regard to the motion before us, I should like to ask two questions: (1) Does the proposal to rest 10 per cent. of the acreage of mature tea prohibit the application of manure to the balance of an estate? And (2) Does it prohibit the opening of new clearing? So far as I can understand, it does neither and if it does neither, I cannot see how it can possibly be contended to the carrying out of that motion will ever curtail the output of tea. If it does not curtail the output of tea it cannot by any possibility affect the market. (Hear, hear.) Take my own case. I happen to be in charge of an estate of 530 acres of mature tea, out of which I am called upon to abandon 53 acres. And what is the result? I shall set for a certain proportion of my older tea which will enable me if I wish to more heavily manure and cultivate balance of my acreage and the result would not be a reduction of my crop at all, but probably an increase. I do not at all say I intend manuring more heavily, but provided I wished to do so I should increase my crop at the same time as I reduced my acreage. Although I do not wish to raise any objections to any scheme which had been proposed for the general benefit of the community, I cannot see how the simple reduction of the plucking area can in any way benefit us. The estates of Udapussellawa, and Dimbula cannot, I know abandon any of their tea without reducing the out-put, but the owners of estates in the low-country cannot afford to tel their land act as a nursery for weeds. I came into this room to-day with the intention of moving an amendment, but I do not want to do so now. I do not see that any scheme which does not go directly to the root of the question—that is, output and not acreage—can be effective. I had intended to propose the appointment of a strong Committee, consisting of an equal number of planters and mercantile men, and including the Chairman of this Association and the Chairman of the Chamber of Commerce, to formulate the scheme. I did not know that such a Committee had met and I do not wish now to move such an amendment. I cannot see how the present scheme is going to benefit us in any way. If anyone can propose a scheme which will affect the output and not the acreage, it shall have my support. (Hear, hear.)

Mr. A. H. Thomas:—Mr. Chairman and gentlemen, after the very able remarks which have been made by Mr. Martin, a great deal of what I was going to say has been taken out of my mouth. I was very glad that the Chairman in his opening remarks, left out of sight the words he used in his first letter to the newspapers and those used by Mr. Rutherford suggesting that it might be necessary that their profits on the tea enterprise should be directed by a Legislative enactment I am glad to see that that has been knocked on the head. Regarding the 10 per cent. question, I think Mr. Martin has shown clearly that it will increase the production. I will take Mr Rutherford's own figures. A property of 5,000 acres would have to knock off 500 acres, supposing the estate gave 450 lbs. per acre, this would amount to 2,250,000 lbs. of made tea for the year. A little pinch of snuff to each tree would easily make up the 10 per cent. of this quantity. With regard to big companies, I think they are going to ruin this country and India. We are now trying to do something which will decrease the output, but I think I am right in saying that half the railway waggons which come up here are full of manure. What is that manure for, gentlemen? Why are we placing one ounce of manure in the soil if it is not to keep the tree alive? Good soil systematically attended to will give us a fair crop. Cultivate and prune the trees carefully and they will give us a fair crop without manure. I beg of you, gentlemen, to leave manuring alone and not to manure your trees for two years. If you will do this I think you will find that you will have a fairly paying crop. You manure your trees, and by manuring think you better the value of your tea. I will refer you to Mr. Joseph Fraser if I am wrong.

Mr. Fraser:—You are wrong, absolutely, Sir. (Laughter.)

Mr. Thomas:—Mr. Fraser will excuse me for singling him out, but he is a very important individual He has put before us statistics very neatly and carefully printed in the papers, and has shown us how manuring will pay, but I am afraid he thinks very differently now. (Laughter.)

Mr. Fraser:—No, I do not. (Renewed laughter.)

Mr. Thomas:—A very large quantity of his teas are going in t Colombo market for not more than 18 cents, and I think I will ch lenge Mr. Fraser to say that that tea does not cost 20 cents to p it on the market

Mr. Fraser:—No, it did not. (Laughter.)

Mr. Thomas:—Gentlemen, this is a very serious matter. Nu rous properties have had manure piled into them and the res has been quantity but very inferior quality. With regard to 10 per cent. question, I think I have proved that those who ma that deduction will put a little pinch of manure to their trees a the result will be a larger production than there is at the pres moment. With these few remarks I support the first part of t Chairman's motion, but I am opposed to the second portion. Bef sitting down I would move (1) "That this Association is of o nion that the large increase in the yield of tea during the past ye has been caused by the application of artificial manures, and urg owners of tea properties to cease manuring their estates, say f a period of two years. (2) That the cess be increased at once one-half, and that advertising and employing of agents for the s of teas be carried out on a much larger and more systematic sc than heretofore; that agents to canvass be secured from the cl of people used to that work, travellers for wholesale houses, e grocers. and either trades people."

The Chairman:—As I understand you to move this as amendment?

Mr. Thomas:—Yes, sir. as regards the cess, I think this should increased so as to enable us to advertise more and have agents over the world. Take a shop-keeper who has a large quantity goods which he cannot sell. What does he do? He advertis Now we must get a certain class of men to do this work for I am a tea planter myself, but I do not think the tea-planter i good agent to send around the world to create a market for o teas. I think we should go direct to grocers' assistants a travellers for tea and other products in England. We might p advertisements in the newspapers inviting these men to apply, a then pay them well. Gentlemen, we have taken the wrong si the wrong edge. What I contend is that we regulate the dema by the supply; we must not regulate the supply by the dema We are trying now to regulate our supply by the present dema We are trying to reduce the quantity.

Mr. James Sinclair:—Mr. Chairman, I may be allowed to ma a few remarks.

The Chairman:—Has Mr. Thomas's amendment a seconder?

Mr. Sinclair:—I am not going to second that. (Laughter.)

The Chairman:—Mr. Thomas's amendment is practically a commendation to increase the cess by one-half. The rest is a n of advice to people manuring. (Laughter.)

No seconder, however, was forthcoming, and Mr. Thoma amendment fell to the ground.

Mr. Sinclair:—Mr. Chairman and gentlemen, I came here to-d prepared to say a good deal on the Chairman's motion and chief I may say, I desired to point out the difficulties attendant on car ing out a practicable scheme. But I have detected a note in t motion and the Chairman's speech, and more especially in t seconder's speech, which indicates that an attempt is to be made form a combination between the planters of Ceylon and the plant of India. If that is the case, I expect that whatever is don Committee will be appointed to confer with India and work ou scheme. For myself I have every confidence with the planters Ceylon working out a scheme which will be acceptable to Compan in London and have a practical effect. I am one of those w hold that

COMBINATION WOULD EFFECT A CURE ALMOST IMMEDIATELY.

(Applause.) We are being most unfairly treated by the dealers home. They are a very small body of men and can very read put into force any course they choose to adopt. I do not kn that there is any cut-and-dried scheme for ruining us, but there i tacit understanding and they have certainly been working that w for many years. On account, therefore, Mr. Chairman, of the ne for combination which I detect in the speeches the less said ab the difficulties of carrying out any scheme just now the bet (Applause.)

Mr. James Ryan:—Mr. Chairman and gentlemen, with rega to this matter—a matter which we must all admit to be serious cannot help thinking that a good deal of the correspondence wh has appeared in the newspapers has been just a little bit hysteri

t has also been to my mind a wee bit un-British. It used to be he idea that he never bawled out before he was hit, and when he as hit he made as little noise as possible and damaged the other an as much as he could without uttering a sound. (Applause.) ow in this case we have had letters upon letters. We have had tters of praise and letters of abuse. We have had the man who as improvident and forgot to manure abusing the man who did anure; we have had the humourist who tries to rub it in one ay and next day to rub it in again, and it does not seem to matter him whether it concerns his own friend so long as he can be unny on two sheets of foolscap. But the matter, as I have said, is very serious one. We have had some thirty schemes put before s. Each one of us has had an objection to somebody else's scheme nd we have not been, as a general rule, able to see any flaws in our wn. We have been treated very kindly in this matter by India. am sorry to say that I regard this exceptionally friendly attitude f India with a very great deal of suspicion, and I regard it very uch from the point of view of the school-boy, who, having received large hamper from home suddenly finds the bully of the school ishing to lend him his knife to cut the string. (Hear, hear.) When we were down, India treated us with a very considerable easure of contempt; when we were beginning to develop a pretty ttle business by advertising and by taxing ourselves in a way that o other community in the world has ever done, India stood aloof, r made a sort of half-hearted attempt to compete with us and then etired from the business. Gentlemen, if we were to treat India as he deserves to be treated, we should throw away the scabbard, and ght them on their own ground, letting the weaker go to the wall. Well, gentlemen, that might be regarded as un-British and very ossibly a little undiplomatic. (Laughter.) Therefore let us accept ndia in the spirit in which she has come—as the prodigal son eturning to banquet on the weal which we have saved up. So let s waive all previous weaknesses of India and take her into our osom. On the other hand, gentlemen, we have our planter-rethren here who behaved very much as India did. They were aaking a very nice thing of it in the low-country and I do not emember any low-country planter coming and helping me in the lack years between 1887 and 1890. Mr. Wm. Saunders came to me ne day and said "I suppose, Ryan, you are not getting very much ea on your estate and that it is beginning not to pay." (Laughter.) Well we will take these gentlemen to our bosom too. I am perfectly villing, with the consent of my partners, to meet the Chairman of he Ceylon Planters' Association, the Indian planters, and the ow-country planters, to abandon 10 per cent. of my acreage or a period of twelve months. And I reckon this, gentlemen, as very noble thing for me to do. (Laughter.) But he knew certain of his neighbours who were making very large profits er acre and I do not think they will go quite as far as I can. t would be quite possible. therefore, for the planters of Dimbula, Dikoya, Udapussellawa, and the higher districts to refrain rom backing up this scheme, yet we might still have 80 per cent. f the tea acreage of Ceylon adhering to the scheme. Many emedies have been suggested for the reckless form of generosity which would sooner spend somebody else's money than their own. (Laughter.) They have even suggested for example that the unfortunate cooly who has done nothing whatever to bring about this tate of affairs, should be mulcted in 10 per cent. of his pay. (Laughter.) Well, gentlemen, no doubt he will be mulcted in 10 per ent. of his pay and perhaps, even more, and the place where he will be mulcted will be where he had not manured enough and very robably, gentlemen, he will have to go somewhere else. (Laughter.) But he will leave off going if you do not mind, and try and consider his matter a little seriously. Now the point is this. we must educe the output. Very well, we are going to follow the Chairman nd stop plucking 10 per cent. of our acreage, provided at least 80 er cent. will agree to this. We must exercise extreme care in lucking and manufacture We must not pluck closely, but it is

PERFECTLY EASY TO PLUCK FINELY.

We must manufacture that tea in the best possible way, and if we ave insufficient withering accommodation, we must borrow the money to increase our withering area. We must restrict the out-ut of rubbishy teas. There is not the slightest use of our trying o keep up the good name of Ceylon if the 20 per cent. who will not oin in this scheme go behind our backs and produce stuff to feed ur friends, the London dealer and the buyer of rubbishy teas in olombo. (Hear, hear) We have all of us from time to time got a ery good price for tea which we knew in our heart of hearts to be very poor tea. It is quite possible to restrict the output of that tea by the formation of a Committee who shall determine whether such a liquor be so much below the standard that it would be inadvisable to put it on the market. I would ask you, gentlemen, to consider seriously the necessity of appointing five trusted men—two planters, two merchants, and a broker—with a view to ensuring that no tea leaves this island of Ceylon which is not a credit to the island. (Applause.) The other remedy I would propose is one which had already been brought forward with much greater skill and by much better men than myself. It is perfectly evident that if we are to open up new markets we must have more money to do it with. I asked the Chairman just now whether it was true that we were going to spend £8,000 in America this year, £8,000 in the Continent, and £8,000 to bolster up green tea. That amounts to £24,000. I am sorry to say, gentlemen, that the income of the "Thirty Committee" will not exceed R3,00,000, which is the Chamber of Commerce estimate. Our own estimate is a little less, and at the most liberal exchange, say of 1s. 4d.—which has been one of the things that has ruined us—it will not exceed £20,000. If we are going to spend £8,000 to bolster up green teas, we shall have to borrow £4,000, or raise it by increasing the cess. Therefore, my remedies reduced to a nut-shell, are:—Sit tight, say little, make as good tea as you can and not too much of it, prevent your tea-maker, and everybody else's tea-maker from sending away from the estate any tea which would be a discredit to Ceylon, and give the "Thirty Committee" more money to work with. (Applause.)

Mr. Labouchere-Hillyer also offered some remarks. He said he felt he was following a person not only of Ceylon eloquence but of continental eloquence—(Laughter)—and his only apology for attempting to follow him was that he would be extremely brief. He thought from the speeches that that had been made and from the telegrams that had been received from London and Calcutta that something would be done to save them from the difficulty in which they found themselves. He strongly deprecated the idea of the survival of the fittest, and hoped that they would stand together and make one united body of Ceylon proprietors and superintendants. The Chairman had proposed a scheme, and, therefore, was above those who simply criticised all the schemes brought forward. (Laughter.) He thought they should support the Chairman's scheme, and he also thought the suggestion put forward by Mr. R. V. Webster with regard to the Government marking of all Ceylon tea was good. The export of poor tea would do the colony harm. With regard to the 10 per cent. proposal, he thought it was a very valuable one and strongly supported it, as it seemed to him the only possible solution of the question. Did it not strike the Chairman that the London men knew something more about the matter than those in Ceylon? He (the speaker) knew absolutely nothing except that which concerned plucking, weeding, pruning, and so on. He grew tea; he did not sell it. Mr. Skrine, who, he believed, had just returned fron London, brought forward his remarks in exactly the tone expected from England and not in the tone that might be found in letters dated from Abbotsford. With regard to the letters which had appeared in the newspapers, barring Mr. Webster's, what were they except letters of criticism and abuse? Could they anywhere find a perfect scheme? Could they have a perfect Government, a perfect law, a perfect Land Act, or a perfect School Board tax? They could never get a perfect scheme and it therefore behoved them to take the best that had been put forward.

After a few further remarks of a jocular character, the speaker was loudly applauded and said he was not quite sure whether the applause meant "sit down" or "go on." (Laughter.) He would, therefore, be really serious in the matter. There was one quality which he really rose to advocate more than any other and that was the policy of sweet reasonableness. Surely in this matter sweet reasonableness was what they wanted to effect and carry out. They did not want to "go" for each other, but to join together and carry out some practicable scheme. (Applause.)

No further comments were offered, and the Chairman, in reply, said:—Gentlemen, the chief criticism of Mr. Martin, who was the first to speak more or less against the motion, was on the subject of manure, but I do not propose to enter into the manuring policy, because where doctors disagree it is not for me to give out advice and point out whether you should or should not manure. The mere fact of resting 10 per cent is not likely to make a man go in for manuring more than he would otherwise. (Hear, hear.) I join issue entirely with Mr. Thomas when he says that no estates manure to live. I firmly believe that 25 per cent. of the estates are manured

to live, and for no other reason It has been a very great pleasure indeed to hear Mr. Sinclair's advice and Mr. Thos. Labouchère-Hillyer's advice after the amount of criticism we have seen in the Press. I trust that more or less it is irresponsible criticism, and that is why I say "Do not criticise any scheme too closely." It is a moral impossibility to get a scheme anything like perfect. I would like to refer to the telegraphed proposals of the London Association. The special sub-Committee considered them very closely indeed and their opinion as practical planters is that the scheme is impracticable. The scheme was that estates averaging 11d. should be exempt, and estates averaging 9d. should rest five per cent., and so on. I am not sure to be crying out about the immorality of my neighbour. Personally, I believe he is as moral as myself. (Laughter.) If he writes and says he will rest ten per cent., I believe he will do so. I do not believe you cannot trust his morality. I say it is a libel on the community. (Applause.) At the same time you must have a certain amount of policing. In the opinion of the Committee the whole scheme suggested by the London Association is impracticable. They think we should choose what appeared to be the simplest scheme, and the chief virtue of resting ten per cent. is its simplicity. Even supposing you have an immoral neighbour when he rests ten per cent. of his acreage he practically put up a flag, and all his neighbours can see that ten per cent. growing. If he plucks that 10 per cent. it will be seen. There is no single scheme which is really efficient. A great number of men who write to the newspapers seem to think that the resting of ten per cent. of the acreage is to be the only thing that the "Thirty Committee" will do, but the Committee will also push Ceylon tea with energy and zeal in a foreign markets. At the same time they strongly recommend all men who can make a profit by fine plucking to do so; if they cannot make a profit by plucking fine, then they will not do so. I do not think there is any need to keep you any longer, and I now formally put the motion to the meeting.

Mr. MacGregor:—Do I understand that you will take the areas of every individual estate?

The Chairman:—It has not actually been defined. I take it that if the motion is carried, it will be left to the sub-Committee Personally, I think it is absolutely immaterial whether we take every individual estate or whether we take each Company. It is nothing to us whether an estate pays. What we want to do is to take the weight of tea off the market.

The motion was then put to the meeting and carried almost unanimously.

Mr. T. C. Huxley:—I propose that the result of this discussion be wired home to the London Association.

The Chairman:—I propose wiring it to London and to the Indian Tea Association in Calcutta.

THE IMPORT DUTY ON TEA.

Mr. Edgar Turner had the following motion in his name:—"That, in the opinion of this Association, the time has arrived to approach the Government of Ceylon asking for (1) the abolition of the import duty on tea in Ceylon, and (2) the application of inspectors to guard against the export and import of rubbishy teas." He said that having, as they hoped, satisfactorily settled the question of over-production they now wanted to find new markets for their teas. With the permission of the meeting he would like to alter his motion. Instead of saying "to guard against the export and import of rubbishy teas" he should like the motion to read "to prevent the import and export of tea below a fixed standard." Permission having been given to alter the motion he contended that what they wanted to do was to find an outlet for their teas. They had heard the cry of "starve London," but they could not starve London because they had got the stuff, and the only way was to create new markets. By the abolition of the import duty on tea in Ceylon he took it that in time Colombo would become the distributing centre for the East. At the present moment no blending could be done in Colombo. Ceylon originally made its way through blending and they must continue that, and the only way he could see of doing that was by removing the import duty on tea in the island. To his mind the result would be that the Colombo market would gradually increase. People would not send down say ten thousand chests of China tea here if it was going to be sold at a loss. The same with India; they were not going to send down tea here if they were not going to get better prices. As he had said he hoped that Colombo would gradually become the distributing centre for the East. The Colombo market was quite satisfactory if they got the teas that suited it. At the present mome they knew that their teas were blended in Australia and Londo and if they were blended in Ceylon they would have better contr If they agreed that the abolition of the import duty was desirab they must have safe-guards and these safe-guards would be I spectors. At the present moment Ceylon was undoubtedly sufferi from a minority who were sending away teas that were not fit f consumption. This destroyed their good name and in the interes of the majority they ought to take some steps to prevent it. Son people said that they must not interfere. They asked Governme to interfere and collect the tea cess. That was a step taken *nolen volens* in the interests of the island. It was compulsory, and no on would say that the tea cess had not done good. If the impo duty were abolished and Inspectors appointed, in all probabili they would see the Colombo market gradually increased.

Mr. Martin:—Mr. Chairman and gentlemen, I have muc pleasure in seconding Mr. Turner's motion, though I am not pr pared to make a speech on the subject, because I did not come her prepared to do so. At the same time I think that any schem propounded by a man who believes that it will tend to the gener advancement of the community is worthy of discussion. and, there fore, I have much pleasure in seconding the motion. (Hear, hear I foresee considerable difficulty in carrying out the scheme. On is that Government will require to have some sort of pecuniar advantage accruing to them from the appointment of these Inspect ors. But I do not think it would necessitate any very larg increase in such a tax as the tea cess to enable Government to pu through some such scheme as Mr. Turner proposes As regards th second part of Mr. Turner's motion, I think it would be a eminently desirable thing to prevent the export from Ceylon of a such teas as are calculated to do harm to the good name of the te industry of this island. (Applause.) There have been teas sold i London, Australia, and I have no doubt elsewhere, which hav caused a great deal of discussion in the public Press, and I thin that any scheme, which can be devised to prevent the export fro this island of teas such as those I have referred to, is deserving all the support we can give it. (Applause.)

THE ARGUMENTS AGAINST.

Mr. A. H. Thomas:—Mr. Chairman and gentlemen, I rise t oppose very strongly the first part of Mr. Turner's motion, bu I support the second portion. I believe that it would be a ver serious day for Ceylon if we were to do away with the impor duty on tea. (Hear, hear.) China tea will be brought into Colomb by millions of lbs. and will be blended with our tea to the propor tion perhaps of 5 lbs. of China to 1 lb. of Ceylon tea. This will b sent to the West. Ceylon will never be the distributing centr to the East. We do not distribute it in the East; we distribute i all in the West. I heartily support, however, the second part o the motion.

Mr. Sholto Skrine:—Mr. Chairman and gentlemen, I also rise t oppose Mr. Turner's motion. The proposal if carried into effec would be likely to do Ceylon an infinity of damage. I would poin out that Mr. Turner has given us no practical scheme by which w should be benefited by abolishing the import duty on tea. Ther is no doubt that the arguments against it are overwhelming (Hear, hear.) To start with, it would open this market, which is very neat little market, specially inaugurated for the good of Cey lon, to the Russian buyer who would have the opportunity of buy ing anything he liked. It would give the Indian man the oppo tunity of swamping this market without any possible benefit to u We had an object lesson in which it has been shown that we, th planters of Ceylon, can, without the slightest difficulty, swamp thi market. I think that that lesson ought to be enough to show u that it would be dangerous to let anybody else into the Ceylo market. (Hear, hear.) It is not calculated to do us any goo whatever. India, I am sure, would welcome a market in Colombo and India, although she is holding out the right hand of friend ship just now, has not, as many speakers have pointed out, bee particularly friendly to us in the past. And even their friendl overtures may be viewed with suspicion. There is no doubt tha were Indian tea allowed to come into Ceylon, our market, for a practical purposes, would be of very little use to us. I, therefor think that we should be doing

A MOST IMPRUDENT ACT

if we gave the slightest support to this motion, and I hope the will be found very few people willing to support it. (Applaus I am glad that the motion has been seconded, so that the opini

the Association may be clearly expressed. Had the motion not en seconded, we should not have had an opportunity of saying at we think about it. It is just as well that the world should ow that we have no intention of opening up this market to as. (Applause.)

Mr. C. Gibbon:—Mr. Chairman and gentlemen, I think there is other very good reason why we should not open our market to ner countries. We must not forget that Travancore will shortly sending out large quantities of tea, and we do not want the lombo market swamped by four or five millions of Travancore as. (Applause.) If the reason is that of blending with China as, it must be remembered that this could be done in bonded arehouses

The Hon. J N. Campbell:—Mr. Chairman and gentlemen, I was Colombo last week and asked a broker there if he could give me s opinion on the suggestion that was going to be made by Mr. rner. He said he had seen one or two of the Russian buyers d other large buyers in Colombo, and, so far as he could make t, there was no demand whatever for the abolition of this duty. here was no desire on the part of the purchasers he had met to in for tea blending in Colombo. The Russian buyers, as a rule, end their teas in Moscow, and it is unnecessary for them to bring eir teas from China or India to Colombo for blending purposes. have had a letter from the same broker to-day, saying he has seen o more Russian buyers, and one of them is in favour of the pro-sal in case he wishes to make brick tea from China and Ceylon ist. And he is absolutely the only man in Colombo who is in vour of this proposal. I am myself opposed to it. In my opinion e time has not yet come when we should open the Colombo arket in that way. (Applause.) If any one wishes to carry out ending, as already mentioned, it can be done in bond. There is thing to prevent that being done. I do not agree with Mr. rner that we should ask Government to appoint Inspectors. I ink that rubbishy tea is a thing that will cure itself. When ople find they cannot sell it, they will cease to make it. I do not ink that there is anything like a large quantity of tea exported om Ceylon which should not go into consumption. There is, I ink, very much more tea exported from India of that kind, and we go on putting restrictions upon ourselves, we shall still leave open to India to export as much rubbishy tea as she likes. I ink it would be extremely irksome to us to have all our best and mmon teas passed by an Inspector, and I am as much opposed that proposal as I am to the other. (Applause.)

REJECTION OF THE MOTION.

Mr. Turner, in reply, said:—I am afraid it is not much use ying anything in reply. I may, however, refer to one or two ints. Mr. Skrine asks what advantage we are going to gain if double the size of the Colombo market. I think it would be a stinct advantage. Mr. Campbell says that it is unnecessary for e Russian buyers to blend their teas here. If they could blend em here, I think it would be a great advantage. They have a ry big trade in Siberia, and it is brick tea that I want to see ade. With regard to the blending of tea in bond, I believe that at matter was brought forward and that this Association would t listen to it. Had they listened it would have been the thin ge of the wedge, and had the making of brick and blended teas Colombo been started there would have been no need for my tion. But this Association threw it out and would not have it.

The Chairman:—Well, gentlemen, you have heard both sides of e question and I now ask you to vote upon it.

The motion was lost by a large majority.

THE TEA CESS FUND.

MR. WESTLAND'S PROPOSAL CARRIED.

Mr. Jas. Westland rose to move "That Government be asked to ntribute from surplus revenue to the Tea Cess Fund a similar m to the amount collected last year." He said: My task, r. Chairman and gentlemen, has been made easier by the eeches which have been made to-day. With regard to Mr. omas's remarks, I will let you into a secret Before bring-g this motion before the meeting I was seriously consider-g the question of asking the community to agree to the tax ing raised by themselves. I asked some of my friends in Colombo, d they said "You surely know that we are too poor to tax our-ves. You will lose your motion." Mr. Ryan has said that the mmittee really want funds. Our member in Council has said at the Government have a very large surplus. From this large plus they had to pay in the space of six years for a policy in-augurated by Government. But instead of taking six years to pay it off, it is going to be paid off almost at once. Now I want a little of this surplus and I have good grounds for asking for it. We know that the Governor has refused to reduce the Railway rates, because, he said, once the rates are reduced, it is a difficult matter to increase them again, and the sum that we shall lose will be a very serious one. Now, gentlemen, I have clearly stated in my motion that the sum I ask for is only to equal the amount that will be lost to the revenue by one year's reduction of the rates. (Hear, hear.) I ask it only for one year. I was told, before I came to Kandy, and since, that it was no use moving this proposal—that Government would never grant the request I made. I asked "why?" The paltry excuse given me was that I dare not do it at this meeting. We have the Governor's word that he sympathises with us deeply and he said that he would help us as soon as we could show him in what way, or words to that effect. What better can we have than

THE PROPAGATION OF THE GOSPEL OF TEA

throughout the world. Preach tea; advertise it. What did Lipton do? What did Pears do? What did "Monkey Brand" do? (Laughter.) They advertised their goods throughout the whole world. We want our teas advertised not only in North America but in South America. I know, as a member of the "Thirty Committee," that our hands have been tied for want of money. We have been spending money lavishly. We have a precedent for asking for this help. Planters have, before now, gone to the Government when they desired to open a road and asked for a grant-in-aid. They have offered to contribute so much, say R50,000, if Government would contribute a like sum. This has been done for years. There is another precedent in Government spending money largely in irrigation works. Why? To benefit the native community; and rightly so. (Hear, hear.) I believe, from my soul, that the money I ask for will benefit not only the planting community, but the whole of Ceylon—(applause)—if it is well spent by the "Thirty" Committee". You have had the names of the members of this Committee which would be responsible for the spending of this money. If you have confidence in them, I ask you to urge Government to give us this money. It is only R3,00,000. (Applause.)

MR. SKRINE SECONDS.

Mr. Sholto Skrine said:—Mr. Chairman and gentlemen, I rise with some diffidence, after the report that has been made on my oratorical powers—(laughter)—to support this motion; and I feel rather nervous, after the remarks that have been made, in making a speech in support of it; I am also nervous from the fact that you have heard so much of Mr. Skrine that you are quite tired of him. I support this motion because it is the only practical way, so far as I can see at the present moment, of raising sufficient funds to exploit successfully the different markets of the world. There is no doubt we are suffering at this moment from over-production. We are already showing our willingness to be taxed, by passing a resolution to the effect that we will cut off one-tenth of our acreage in order to reduce our production. But there is something more necessary after reducing production, and that is to open other markets. The low market has made the whole of us poor, and it is quite impossible to propose further taxation. I think, therefore, that Mr. Westland has made out a very good case. We have, as he said, the sympathy of the Government, and I honestly believe that the Government is anxious to see this industry out of its difficulty—(hear, hear)—not only out of selfish motives, but because it feels that the Ceylon planter deserves something of Government—that he has made the brightest jewel in the British Crown. (Applause.) If it were not for the Ceylon planter, Ceylon, instead of being the brightest jewel in the British Crown would be another Madagascar. We have, too, an infinite number of precedents why Government should help us, and Government would not be straining a point by holding out to us a helping hand. When Mauritius and Jamaica were in considerable financial difficulties, we saw the Colonial Secretary willingly come forward and help them in their difficulty. Shall it be said that the Ceylon Government, when we are in difficulties and ask for so paltry an aid, will withdraw its hand? I do not believe it, gentlemen. I believe the Governor and the Colonial Secretary will be only too glad to do what they can and prove in a practical way that they absolutely sympathise with the planter in his difficulties. For that reason, gentlemen, I support this motion in the confident hope that Government will come forward and help—in the confident hope that Government will realise what the planter has done and is

willing to do for his country. (Applause.) Every planter this year has given of his blood and his treasure to help the Empire, and it is not a great thing we are asking for to-day—that Government should give us back some of the surplus tax which has been taken out of our pockets in order to aid us in our difficulties. (Applause.)

SUBSIDISING ONE PRODUCT.

Mr. Thomas:—Mr. Chairman and gentlemen, does this motion not clash with Mr. Campbell's motion? We ask Government in the latter motion to release us from taxation, and had we not better go with that resolution with clean hands? Another thing is that we are now asking for a donation from Government of something like R300,000 on one product only. The Government may turn round and say "Why should the tea industry get this money more than the cocoanut, cocoa, cardamom, or any other industry in the Colony?" I am very doubtful if Government will accept the motion. From our own pockets we must strive to get a market all over the world. Mr. Westland supported everything I said in my amendment, with a difference that I wanted the money to come out of our pockets. If it was the only product in the country, it would be a different thing. But there are half-a-dozen products, and we cannot expect Government to give us alone this large sum of money.

GRANT-IN-AID.

Mr. W. D. Gibbon:—Mr. Chairman and gentlemen, I am very sorry that Mr. Thomas has not been able to follow up the arguments that had been used by the various speakers. I thought they had been very simple and explicit in putting the matter before us. I should have thought that by this time Mr. Thomas would have been able to comprehend the fact that there are certain occasions on which the Government is prepared to grant such help as Mr. Westland has proposed. Mr. Westland very clearly pointed out one, *viz*, the grant-in-aid scheme, by which Government, out of its revenue, contributes half the expense of a road in a certain district. It is a scheme in which I have been interested as a Committee-man for the past ten or fifteen years. The Government has never talked about any inequality in that. Even the newspapers belonging to our friends the native community have never found any fault with the policy, and I cannot see that there is any inconsistency in Government giving us this help which we now so sadly need. (Hear, hear.) Going upon the principle laid down by Mr. Thomas, England made a great mistake in taxing one particular class of product. They had no hesitation in putting the increased tax of 2d. on our teas. Did the other communities find fault with Government for putting on that tax? Not at all. I believe, therefore, that the request is one which Government will think twice before refusing. (Hear, hear.)

PROTECTION FOR CEYLON'S GOOD NAME.

Mr. R. V. Webster:—Mr. Chairman and gentlemen, I have great pleasure in supporting Mr. Westland's proposal. At the same time I think there would be no harm in bringing to your notice a very valuable asset which we have overlooked. That asset has been obtained with much care and with the expenditure of much money. The asset is simply "Ceylon Tea." Very large sums have been spent during the past few years, say ten years, in bringing the words "Ceylon Tea" before the public. Now I can talk with a little experience. During the past ten years I have completed thirteen trips round the world. I have visited, with the exception of China, Japan, and South America, every country in the world When I first began my travels it was quite an exception to find "Ceylon Tea" in any shop windows. Now it is everywhere. You find Ceylon tea in at least 90 per cent. of the shops if you go to Australia, New Zealand, Canada, and even the United States of America, with the exception of the Southern States, which have not been exploited. We have brought Ceylon tea before the world. We have created a demand for it, and the public ask for it, but I am sorry to say that the unscrupulous merchants of the world buy our teas and blend them with cheap Chinas, Javas, and various other teas. To-day we are receiving more benefit from it because we are producing teas at such a low price; but should you reduce your output you will very soon find that the merchant will again resort to blending with a large proportion of China, Java, and other teas to bring down the cost. Now we have to devise some scheme to protect the name of Ceylon tea, and so reap the benefit of it. It is a difficult thing, but we must not stop because it is difficult; we must tackle it. (Hear, hear.) There is no reason why we should not devise some scheme whereby we shall reap a benefit from the valuable asset to which I have referred. In Queensland, only last year, I was walking down a street, and saw in a shop window "Ceylon Planters' Association, Colombo." I visited the shop and bo teas there, but I am sorry to say that Ceylon tea was conspic by its absence. No attempt, I think, has been made so far to tect our interests. It is a difficult thing to formulate a sch but I think we could devise some means whereby we can pro ourselves from these frauds.

NATIVE TESTIMONY.

Mr. D. Joseph:—Mr. Chairman and gentlemen, I rise to sup the motion I merely came to hear the proceedings, but after statements that have been made with regard to the good which planting enterprise has rendered to Ceylon, I rise, as a nativ support those statements. (Hear, hear.) We all know that w coffee, for instance, was paying, the country was prosperous. W coffee failed, we all know what happened. Around Kandy alon value of land went down, and, in fact, people were actually on brink of starvation. Through the enterprise of the tea-plan however, prosperity returned. H. E. the Governor once sai think, that the planting community and he rowed in the same I do not exactly remember his words, but I believe the illustra intended was that the island depended largely on the prospe and enterprise of the planting community. I think no truer w were ever spoken by the Governor. The price of land may be h and the people prosperous, but immediately there is a drop in price of tea, the land becomes less valuable. I may instanc case in which an owner refused R4,000 for his property, but l on sold it for R2,000. I think, therefore, that it would be v foolish policy on the part of Government—something like kil the goose that lays the golden eggs—if they do not grant the v small concession asked for. I have very great pleasure in supp ing the motion. (Applause.)

Mr. Westland:—Mr. Chairman and gentlemen, I do not thin necessary to say anything in reply.

The Chairman then put the motion, which was carried *nem. c*

OVER-PRODUCTION OF TEA.

The following remarks of Mr. J. E. Aird, in a lette the *Englishman*, deserve more than passing attention:—

There are at present several schemes before tea producers inte ed to remedy the so-called over-production which is clogg industry. If we assume that it is necessary for tea producer sacrifice a certain proportion of their income for a year or two order that profits may be greater in the following years, it wo be well to make as sure as possible that there will be a return for sacrifice. It is not my intention here to point out the execu difficulties attending any particular scheme for the reductio crop, but rather to consider, by comparison with the alterna method of relieving an overstocked market, the advantages and advantages of the two methods. Ignoring the almost insuper difficulties of combining the multitudinous interests involved in reduction of output, let us suppose that the combination is poss and that Ceylon and India are, as an experiment to manufact ten per cent. less tea than the amount already estimated for, I and Ceylon together supply, let us say, eighty per cent. of the wor consumption; so that the ten per cent. reduction would mean e eight per cent. on the total output, and as only the lower grade would be taken off the market, it is not too much to suppose t other tea producing countries would increase their outturn ten cent. to supply demand for low grade teas. It will be seen then a ten per cent. reduction of output by India and Ceylon means six per cent. on the total output of the world. It is questionab prices will rise proportionately to the reduction of supply, but if be admitted, it must also be allowed that prices will fall again w outturn becomes normal. Supposing that the proportionate crease in price takes place, Indian and Ceylon gardens, then long as the experiment lasts, will have a 6-1/3 per cent. rise in pr on a ninety per cent. crop, but as an eleven per cent. rise is require make a ninety per cent. crop pan out equal to a normal one, we h here a dead loss of 4-2/3 per cent. on our present prices. This may appear much of a sacrifice for a year or two, but as neither the num of consumers nor amounts consumed per head will have increase the meantime, with all respect to the men who have devised the sche I would ask to be shown wherein we will be benefited when pr and our turn become normal at the conclusion of the experimen

Let us now consider the alternative scheme for relieving over-oduction by increasing consumption. To increase the number of nsumers or amount consumed per head there must be no curtail-ent of crop, nor enhancement of prices, but at the same time it ands to reason that if all the surplus tea over present consump-on can be taken off the market by fresh consumers, there will be drop in prices. Still assuming that it is necessary for tea oducers to sacrifice a portion of their incomes, and ignoring as fore the difficulties of combination and collecting, let us consider iat would be the probable effect of an amount in hard cash equi-lent to the loss on ten per cent. reduction of output were applied increase consumption. This sacrifice, as I have pointed out, ll amount to about five per cent. on present income or in other ords allowing twenty per cent. of the fund for expenses of ad-inistration and distribution, it will admit of four per cent. average ass tea of the Indian and Ceylon crops being taken off the mar-t and distributed gratis, as an advertisement, among people who present do not drink tea. As the taste increases a price could demanded and a proportionately larger percentage of crop taken f the market; and there would be small chance of other tea oducing countries underselling us, for with such a lever of control our hands, a demand for any particular class of tea could be mediately supplied at a price which no competitor could look at. ne of the many advantages of this scheme is that, once the rate levy is fixed, proprietors and share-holders would be better able calculate how they will stand during the experiment. There n be no doubt that, the numbers of consumers being increased, e final results will be more beneficial and permanent than any at can be looked for from the artificial expedient of reducing itturn.

ONE TASTE IS ENOUGH.

The writer never had a taste of rheumatism but once—about ur years ag- it was—and it laid me up and made me groan for x weeks. And I am not praying for any more. I can get a art-load now, just by thinking how it felt. But, oh, what a lot folk catch it worse than I did.

Here is Mrs. Annie Hill, she is one of them. Or rather she *was;* e is right enough in these days. Her idea of talking of it is to eer some other sufferer, and show him the way out. And we ank her for that. It's the proper feeling to have towards our llow-travellers through this vale of tears—and pains.

"Some eight or ten years ago," says Mrs. Hill, "I was a perfect artyr to rheumatism and indigestion. As if they were not enough r one poor woman to bear, I often had frightful pains in the chest, th weakness all over my body. It was awful, and I didn't know iat the end of it was going to be. Now and then I was completely ostrate.

"We hunted everywhere for a cure, and I tried medicines, until e empty bottles in the house rattled wherever you put your hand t; all to no earthly good. We spent money and spoiled hopes, d that's the story.

"At last I saw an advertisement of how Mother Seigel's Syrup d cured a man of rheumatism and other ailments—just like mine. told the tale himself, as I am telling this. I will try it—so I id to myself.

"It acted splendidly, and I kept on with it until I was entirely ll. It cured my rheumatism, my indigestion, and my liver mplaint—all in a bunch. Sometimes I bought the Syrup by the lf dozen in order to get it a little cheaper.

"I am an old resident of this district, having lived here for the t fifty years. I am now seventy-five and in good health, I am own far and wide, my husband and sons being in the farming d dairy industries on a fairly large scale. I am never without ottle of Mother Seigel's Syrup in the house. There are plenty medicines in Australia, goodness knows; almost as thick as the bbits used to be, but none, so far as I know, to compare with ther Seigel's Syrup."—Mrs. Annie Hill, Kayuga, near Muswell-ook, N. S. W., Sept. 21st., 1899. Witness, A. Halpin.

"I have known Mrs. Hill for eight years. Her testimony to the tues of Mother Seigel's Syrup can be implicitly relied upon. e is altogether incapable of making any statement that will not nd the closest investigation." C. J. Spratt, Auctioneer for the rmers' Association.

MARKET REPORT.

[*Per Mail advices of 8th February* 1901.]

COFFEE.

The London Commercial Record says:—There is no improvement to report in the general tone of this market, and with the few exceptions of fine colory lots of Costa Rica the tendency has again been to easier prices, especially with regard to the limited supply of new East India, the quality of which is still open to much improvement. A feature of the week was the offering of 580 bags Hawaii the largest consignment yet received from there, but there was very little demand for them, and not only a few lots sold. The market for "futures" was very flat for some days, and March Santos fell to 29s 9d, then a better feeling prevailed, which subsequently gave way to depression on large receipts, but at the close, on a rise in Exchange, values have improved; yesterday March Santos sold at 30s 4½d to 31s, May at 30s 10½d to 31s 6d, July at 31s to 31s 9d, September at 31s 4½d to 32s, and December at 31s 9d to 32s, closing with buyers at the best points.

London	Santos	March delivery	31s 0d.
New York	No. 7 Rio	,,	5 75 cents.
Hamburg	Santos	,,	30¾ pf.
Havre	Santos	,,	37¾ francs.

At the Dutch Trading Co's public sale, held on 5th instant in Rotterdam, 29,260 bags 90 cases were offered; good odinary Java realised 30½c against 32c valuation, and 35c in October, 1900.

Imports, Deliveries and Stock of Coffee in London, are as follows:—

	Stock.		Imports.	
	1901.	1900.	1901.	1900.
Tons	13,988	12,559	2,214	2,330
	Home Consumption.		Export.	
	1901.	1900	1901.	1900.
Tons	1,857	2,183	1,356	2,342

The preceding figures exhibit—	Tons.
In the Imports a decrease this year of	116
Home Consumption a decrease of	326
Export a decrease of	986
Stock an increase of	1,429

Auctions this week have passed off as follows:—

East India. 210 bags offered and 175 bags sold—*Wynaad* smalls 42s, low middling 13s 6d, pea-berry 55s.

Jamaica. 8 barrels 46 bags sold. good ordinary 37s 6d, peaberry 52s 6d.

Costa Rica.—2,315 bags catalogued and 2,100 bags sold, smalls 33s to 47s 6d, low middling greenish to colory 45s 6d to 50s 6d, middling 51s to 58s, good middling 59s to 64s, bold 60s 6d to 75s 6d fine bold 77s to 90s 6d, peaberry 53s to 83s.

Vera Paz.—286 bags mostly sold. smalls, 39s, 6d, low middling 46s, bold 54s 6d. peaberry 55s.

Salvador.—63 bags partly sold, smalls 32s, low middling 46s, peaberry 52s.

Colombian.—Of 749 bags offered 670 bags sold, smalls 29s to 34s 6d, fine ordinary 37s 6d to 41s, low middling dull greenish to middling brownish 42s to 48s 6d, peaberry 47s to 55s 6d.

Mexican.—Of 970 bags offered 125 bags sold, peaberry 48s to 50s.

Hawaii.—580 bags offered but only 36 bags peaberry sold at 32s to 50s.

Venezuelan.—50 bags bought in.

Guatemala.—305 bags partly sold, low middling 46s to 47s.

Brazil.—Of 297 bags washed Santos 30 bags peaberry sold at 52s.

February 6 ...	5·55	5·55	5·60	5·65	5·70

TEA.

China.—Congous continue to meet a very poor market, and at public auction this week only a small part of the 2,515 packages presented for competition sold, although prices were lower. Souchong realised 3½d to 3⅝d, Oolong 3½d to 3¾d, Scented Caper 4d to 6d, Shiftings 4⅛d.

Indian.—Sales were slightly lighter than in the week before, *viz.*, 57,500 packages, compared with 59,800 packages and 33,400 packages in 1900.

Dealers did not seem able to cope with the large quantity brought forward following on the heavy supplies previously offered, and an easier tone was apparent for most descriptions. Common to fair leafy kinds were further depressed, Pekoe Souchongs touching 3½d per lb. Medium grades, unless possessing autumn flavour or some special characteristic, met a languid demand, and reduced prices often had to be accepted in order to close them. Fine and finest were comparatively scarce, and on the whole realised steady prices.

As was the case at this time last year, the statistical position is again being interfered with, and figures are misleading owing to the excessive payments made in anticipation of a possible rise in Duty.

January deliveries were:—

1901—18,256,000 lbs. 1900—17,490,000 lbs.

For 49,900 packages on estate account 6½d per lb. was obtained, against 7¾d per lb. for 30,000 packages, and 9¼d per lb. for 32,300 packages in the two preceding seasons.

Ceylon.—Auctions totalled 27,900 packages versus 39,400 packages on the previous Tuesday, and 23,500 packages a twelvemonth since.

A great deal of irregularity was noticeable in the ideas of buyers, and there was less competition for Pekoe Souchongs and Pekoes under 6d per lb., the former selling down to 3½d per lb. Medium descriptions ruled about steady, there being a few more export orders in the room than of late for those suitable to the Continental trade. The best liquoring Broken Pekoes attracted attention, and together with the few choice lines, went off well.

The average has declined to 6¼d per lb., which point has not been recorded hitherto. On the 31st ultimo it was 6½d per lb. and 7½d per lb. in 1900.

Deliveries in the past month were:—

1901—10,065,000 lbs. 1900—9,020,000 lbs.

Java.—Only 960 packages of direct import passed the hammer, with a weaker tendency for the majority of the invoices brought forward. and many lots were withdrawn in consequence of bids being under valuations. Nearly 1,800 packages are advertised for the 14th instant.

Deliveries—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns are, *viz.*:—

From 1st to 5th February,	1901	...	...	6,986,037 lbs.
Do. do.	1900	...	...	2,946,672 „

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India ...	... 44,232	13,267	57,499

COCOA.

Importers are still desirous to quit, and at auction on Tues... when 6,362 bags were catalogued, about 4,000 bags sold. Pri... were somewhat irregular. West India, with the exception of Tr... dad, declining from 6d to 1s 6d, whilst fine Ceylon again advan... and other growths showed no material change. Of 830 bags Trini... 440 bags sold at about valuations middling to good 67s to 69s... The further large supply of 2,740 bags Grenada practically all s... at an irregular decline of 6d to 1s 6d, good to fine selling at 65s... 66s and common to fair 63s to 64s. 10 bags fair St. Lucia brou... 63s 6d, while 36 bags Jamaica partly found buyers at 63s 6d. b... these being 6d to 1s down. 59 bags Costa Rica realised 65s to ... 6d, and 5 bags Surinam 65s 643 bags of Guayaquil and 23 b... Venezuelan retired unsold. 33 bags African sold at 63s to 64s... Again higher prices were obtained for stand-out lots of Ceylon, ... the medium and common qualities are not much wanted and pr... slow of sale; 1,604 bags were catalogued and 560 bags sold—fin... very fine bold bright red 99s to 108s, fair to good bold and medi... 80s to 90s, middling ditto 76s 6d to 78s, and smalls 59s 6d... 78s per cwt.

PEPPER.

Black.—The market has ruled firm and for arrival higher pri... have been paid, but the tone at the close is dull. About 200 t... Singapore have changed hands, *viz.*, January-March and Febru... April shipment at 6¼d to 6 9/32d, March-May at 6¼d to 6 11/32d, Ap... June at 6 11/32d, and June-August at 6⅜d to 6 13/32d. On the spot s... of fair Singapore have been made at 6 1/16d to 6 3/32d.

Nothing offered at auction on Wednesday.

WHITE.—Has been much neglected and sales are unimportant. Only 10 bags Ceylon were brought to the hammer on the 6th tant; they retired at 9d per lb.

GINGER.

COCHIN.—was not represented at the weekly auctions, but vately an active demand has sprung up, 2,000 bags selling at her prices—good fair medium and small washed rough at 33s to , and rough Calicut Sorts at 33s 6d to 35s per cwt., with yers at the close at the top point.

JAMAICA.—28 barrels partly sold—small thin washed, part dark, 6d per cwt.

CINCHONA.

The exports from Java (according to the N. V. Nederl. Veem.) Europe during January amounted to 1,000,000 Amst. lbs. against 5,000 in 1900, 509,800 in 1899, 956,000 in 1898, 390,000 in 1897, d 970,000 in 1896. The total weight of the 8,837 packages to be ered at Amsterdam on February 21 is 780,825 kilos. consisting 391,760 kilos. Ledgeriana. 114,294 kilos. Succirubra, and 105,675 os. Hybrid. The exports from British India for *seven* months ded October were:—

	1900.	1899.	1898.
Lbs....	1,683,488	1,458,730	852,128

QUININE.

The English and German makers of sulphate advanced their quotations on Monday by ½d per oz., and now quote 1,000-oz. lots in 100-oz. tins at 1s 2d per oz. Messrs. Howards & Sons' price for this quantity is now 1s 3½d. This advance has been due to a better consumption demand both on United States and home-trade account Makers have sold small parcels at 1s 2½d for forward delivery. A corresponding rise has, of course, taken place in the secondhand market, and a good business has been done, including spot at 1s 1⅞d to 1s 2d, March 1s 2d, and May 1s 2¼d to 1s 2½d. To-day the market is slightly easier in second hands, 1s 2¼d having been paid for May delivery and sellers thereat. In the United States P. &. W. brand has been advanced to 30c.

VANILLA.

The small supply of 345 tins offered in auction practically all sold at full prices, to 1s advance chiefly on short lengths. The buying was chiefly the home trade, and there was a good demand. The following prices were paid:—

SEYCHELLES.—8 to 9 inches, 23s to 25s 6d; 7 to 8 inches, 22s to 23s; 6½ to 7 inches, 21s to 22s 6d.

MAURITIUS.—8 to 9 inches, 25s to 26s 6d; 7 to 8 inches, 22s to 24s 6d.

(AVERAGE FOR ALL INDIA 6·34d., FEBRUARY 8TH).

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first; As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to E. C. DUFF & CO., Proprietors, "Planting Opinion," 106, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 15th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Munzerabad.

March 4th.—The blossom this year is a complete disappointment, and prospects are very gloomy, coffee cannot be cultivated at the present prices. *Works*—Pruning, manuring and weeding. *Health*—Good. *Interesting items*—A combination is being formed to see if some protection cannot be given to the fish and game of the district. The census was quietly and quickly gone through with on the evening of March 1st.

COFFEE.

We publish to-day a report on the Coffee movement in the United States and portions of a statement issued by the Board of Trade. Neither of these affords very cheerful reading for coffee-planters. At the very outset the Board of Trade refers to the difficulty of obtaining reliable statistics regarding Coffee in various countries. Unfortunately, statistics of production must be taken as below rather than above the mark of reality; as for consumption, statistics may be relied upon when coffee is imported into a consuming from a producing country. Where figures fail is in regard to home consumption in producing countries, as, for instance, Brazil, Mexico, and India. The Board of Trade enumerates the chief countries of production thus:—(1) Brazil, (2) Venezuela, (3) Colombia, (4) Mexico, (5) Costa Rica, (6) Guatemala, and (7) Hayti. No definite distinction is drawn between "mild" coffees and others, but a very interesting point is referred to in the remark that in the United States "while the average price of Brazilian Coffee has fallen from 20 cents (10d. per lb.) in 1891 and 1892 to 6 cents (3d. per lb.) in 1898 and 1899, the value of Costa Rica Coffee has at the same time fallen only from 19 cents in the former period to 14 cents in the latter, and Guatemala Coffee from 16 cents to 12 cents." The natural inference is that superior,

mild Coffees have been growing in favour. This is important to Indian planters, whose coffees are mostly of a class to compete with Costa Rica, and Guatemalan rather than with Brazilian. Yet the fact mentioned has little direct interest for coffee-planters in this country. A glance over the figures given elsewhere will show that Indian coffee-planters have practically no stake in the United States, and are thus only indirectly affected by fluctuations of market there or variations in the popular taste.

The United States occupies the same position in regard to Coffee as the United Kingdom holds in regard to Tea. It heads the list of consumers, and the demand among its peoples has been rapidly increasing. In 1898 there was an enormous spurt in American importations of Coffee; this fell back in 1899, but there was still left a larger importation than in any earlier year since 1898. The demand per head of population has increased, as well as the total demand, and a comparison of 1890 with 1899 shows that whereas the States imported for consumption 490,000,000 lbs. in the former year, in the latter imports were 801,700,000—showing an increase of nearly 65 per cent. Some of our readers will note with interest that there is no duty on imports of Coffee into the United States. They will perhaps attribute the rapid growth of consumption largely to the fact of the trade having been left free and unfettered; and this can hardly have failed to exercise some influence on the increase in demand per head of population. Much of the increased trade must, of course, be attributed to increase of population. Consumers in the United States give the preference to Brazilian Coffee, whether because of its very low price or for other reasons we cannot say; probably, not only because of its cheapness but also because sales are vigorously pushed by various merchants whose main trade consists in importing Brazilian Coffee. In the United Kingdom the largest amount of imports is from British India Prices in London have fluctuated as well as those in New York, though not so violently. In 1890 and 1897 they were over 10d. per lb.; in 1885 they sank to 6.82d.; in 1899 to 7.24d.

Now, we call special attention to the statement of the Board of Trade and the report on the American Coffee movement for a particular reason. Here we have distinct information given as to the chief consuming markets. The United States is at the head In Europe the country in which the most coffee is taken is Germany. France comes next. The question arises whether in the United States and in Germany demand for *Indian* coffees cannot be stimulated. France is already a large buyer of East Indian Coffees, and though the trade is at present threatened by proposed changes in the French import tariff, we trust that these changes will not be made in such a manner as to affect Indian coffee. In Germany India finds no proper market; in various other Continental countries Indian coffees are scarcely known. In Australasia coffee is but little drunk, tea being the popular beverage. These facts, read with a knowledge of the current grave depression in the Indian coffee industry, point un takably to two conclusions: (1) that it is essentially neces that Indian coffee should be vigorously pushed in markets as the United States and Germany, where Coffee, not the Indian description, is largely consumed; and (2) it is desirable that Coffee should be 'canvassed' in countries Australasia and the United Kingdom where the popula of tea continues to hold the front place. Hence the ex diency of prompt action being taken for the building up o Indian Coffee Foreign Markets Fund. The Shevaroy Coorg planters are willing. We shall be very please learn that Mysore, the Nilgiris, and Wynaad are prep to join heartily in carrying out the suggestion lately m that there should be a Coffee Cess, on similiar lines those along which the Ceylon Tea Cess is run, and for empl ment in similar fashion.

THE TEA CRISIS.

Although a great deal has been said and written duri the week on the present Tea Crisis, we defer remarking u this subject again at length until next week. The sim fact is that many of the speeches and letters referred to o serve to make confusion worse confounded, and our read have lately had such a flood of Tea that we hesitate to tr them to another deluge. For the present we need only s that at the Annual Meeting of the Indian Tea Associati (Calcutta) on the 2nd instant, Mr. H. C. Begg, the Chairma stated that it seemed the day could not be far distant wh they would have to consider the advisability of reducing t production of gardens and devote attention rather to the i provement of the teas than extending the cultivation. A are agreed as to what they have to do, but are not sure th they are agreed on the best way of doing it. They must t to decrease the supply or increase the demand. He thoug something ought to be done in both directions. The Gener Committee thought with him that the greatest efforts shou be given to the work of increasing the demand because th doubted the possibility of any scheme to restrict producti being lasting enough to keep the combination together fi for years. It was most difficult, for especially when pric rise, the temptation to growers to break away is gre Mr. Begg thought that we might yet see the Tea Cess accomplished fact. Mr. Mann, Agricultural Chemist, stat that the present working prevailing in India should tend n so much to increase production, but to improve quality. Fi plucking, he does not think will improve quality whereas a great extent close plucking will undoubtedly do so at t expense of the tea bush. Mr. Carter stated that there we three causes of over-production:—(1) Over-plucking, (2) t rapid supplies, and (3) persistent shipping to London, r gardless of the requirements of foreign markets.

Mr. Ashton and Sir Patrick Playfair spoke against t export duty, on the supposition that Government might dive the revenues to its own purposes. The Chairman moved th the rate of subscription should be one anna per acre for ea garden belonging to the Tea Association. He moved al that the crop should be reduced 10 per cent. for garde whose teas last year fetched 7d. or under; 8 per cent. f gardens which fetched 7d. to 9d.; 5 per cent. for those whi fetched 9d. to 11d.; and that gardens should be exem whose tea fetched an average of 11d. and over.

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nicholson's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf people, unable to procure the Ear Drums, may have them free.

Address—No. 989 D, The Nicholson Institute, Longcott, Gunnersbury, *London*.

[w. 26-5-00—26-5-1901.]

THE BRITISH TEA DUTY.

The General Committee of the Indian Tea Association Calcutta) has been informed, by the Secretary of the Gov-nment Legislative Department, that the resolution respect-g the British Import Duty on Tea has, under instructions om the Viceroy, been telegraphed to the Secretary of State r India with a request that it may receive the due conside-tion of His Majesty's Government. The Governor of eylon has also cabled home to the Secretary of State for e Colonies stating that his Government desires earnestly impress on His Majesty's Government disastrous conse-uences which further increase of duty on tea may entail on e chief industry of this loyal Colony. Whether these essages have the desired effect or not they will at least sure that the British Tea Duty will not be raised until the *ros* and *cons* of the matter have been well considered. It a curious thing that English statesmen during the las eneration or two have always had a fancy for picking up ecessary scraps of taxation from the breakfast table. To us ut here, it appears as if a small tax on Sugar might provide e Chancellor of the Exchequer with any additional funds which he is in need. But it is a regrettable fact that ngland's commercial treaties with various nations form such maze that it is very difficult to steer clear of the provisions nd conditions of each one of them when meditating a ew branch of taxation on imports. We can but hope, for e present, that Tea and Coffee will escape any increase of e burden that they have now to bear. The Import Duty Tea, especially, is already much too heavy.

TEA "FUTURES" IN THE U. S.

We learn from the *American Grocer* that trading in tea for ture delivery began on January 21 on the New York Coffee xchange. This is the second attempt to establish option ading in tea. The result of the first experiment was that lower Wall-street began speculating, were caught heavily, d then the trading stopped. This year the first sale was ,000 pounds for February delivery at 13·30 cents, and a cond lot at 13·50 cents. Our contemporary also reports:— A few sales have been made on the Coffee Exchange, in-ading 15,000 pounds May delivery at 13·90c, and 15,000 unds July delivery at 13·80c. Japan No. 4, spot, the basis contract trading, 14½c in bond. On Tuesday 15,000 pounds arch delivery at 13·40c." The rules under which trading in a for future delivery are conducted provide that all contracts r future delivery of tea shall be for 15,000 pounds, or ultiple thereof, deliverable in bond; each lot of 15,000 unds to be exclusively either Japan, green, or black tea, to in licensed warehouse, and to be composed of not more an ten lines of tea; deliveries on each contract of 15,000 unds not to exceed or to be short more than 100 pounds, d to be collectively of not more than three import bonds. The cost per month of carrying tea which costs 14 cents r pound, as posted on the New York Coffee Exchange, is ured by including storage, insurance, and interest at 6 per nt., not including brokerage charges and grading. Storage verage), 3c per half-chest; insurance, 40c on $100 per ar. For the different periods of time the cost is as follows: the end of one month, 14·13c; two months, 14·26c; three months, 14·39c; four months, 14·52c; five months, 14·65c; six months, 14·78c; seven months, 14·91c; eight months, 15·04c; nine months, 15·17c; ten months, 15·30c; eleven months, 15·43c; twelve months, 15·56c. Basis—Storage (average weight of half-chest, 60 pounds, at 3c), ·05c; insurance ($8·40—half-chest at 8c per month per $100), ·0112c; interest at 6 per cent., ·07c; total, ·1312c per pound."

NOTES.

Cinchona in London. Cable advices, dated 2nd instant, report a firm market. Price per unit 1½d. Monthly stock 10,000 packages.

Drought in Sylhet. A severe drought prevails in South Sylhet, and the tea crop outlook is serious. Only a quarter-of-an-inch of rain has fallen since 20th October. Nature is evidently taking her own measures to check over-production in Sylhet.

The Proposed Indian Tea Cess. In the course of an interview which the Calcutta correspondent of the *Times of Ceylon* had with the Secretary of the Indian Tea Association, Mr. Parsons stated that the Southern India planters solidly support the proposal for a tea cess, while others are waiting home instructions.

Ceylon Cardamoms. For the year ending December 31, 1900, the exports from Ceylon were 537,455 lbs., against 499,959 lbs. in 1899, 531,473 lbs. in 1898, and 532,830 lbs. in 1897. Of the above amount, 333,996 lbs. in 1900 were shipped to U. K., 117,290 lbs. to India, and 65,529 lbs. to Germany, &c.

The Portmore Tea Company. The Portmore Tea Company, Limited pays a final dividend of 8 per cent., making a total of 13 per cent. for the year. £684 is carried forward. The Board of Directors is reducing the plucking area as recommended by the Joint Indian and Ceylon Committee.

Jamaica Coffee. The Blue Mountain Coffee Company, Limited, was registered on December 31, by Last & Sons, 19, Pall-Mall East, S. W., with a capital of £2,000 in £1 shares. Object: to carry on, in Jamaica or elsewhere, the business of coffee (and other produce) planters, growers, and merchants, etc. Registered without Articles of Association.

Annual Production of Rubber. It has been estimated that the total approximate annual production of rubber is 57,000 tons. Of this amount, 21,000 tons by the United Kingdom, and 15,000 tons by the rest of the world. The Amazon District produces 25,000 tons; East and West Africa, 24,000 tons; and parts of South America, other than the Amazon district, 3,500 tons.

Colombo Tea Sales. At the public sale of tea at Colombo on the 27th ultimo about 9,291 packages = 773,643 lbs. were offered, of which about 7,124 packages = 604,259 lbs. were sold. The *Times of Ceylon* says that the sale passed off with good spirit, bidding

being brisk, especially for teas with any quality or flavour. Common sorts were in fair demand at late rates.

Perfume Farming.

A Perfume-farm and Factory have been established at the Collie River, Western Australia. Mr. Curtin has established a distilling-plant for the purpose of dealing with native plants, beginning with the wild verbena. He has several acres of lavendar planted, but means to extend this to twenty or thirty acres. The factory was declared open by Sir John Forest on November 24.

Manuring and Close Plucking.

Judicious manuring is excellent—writes an old Ceylon planter—but carried to such an extent as to double your yield it becomes serious, and if indulged in by a sufficient number of estates will ruin the industry in a shorter time than most men think. I heard the other day that a London firm wrote out that certain estates "have sent us everything excepting the roots of the bush."

Java Quinine.

The following sales are announced for 1901 :—

	Kilogrammes Sulphate of Quinine.
27th February	about ... 3,500
3rd April	„ ... 3,600
15th May	„ ... 4,400
19th June	„ ... 4,500
24th July	„ ... 4,600
4th September	„ ... 4,700
9th October	„ ... 4,800
13th November	„ ... 4,900
18th December	„ ... 5,000

Trout Ova for Ceylon.

The Ceylon Fishing Club have indented for this year's supply of trout ova from other hatcheries than those of Messrs. Andrews & Andrews, of Surrey. The first consignment of brown trout from the hatcheries of the Earl of Denbigh left England on the 30th January in the SS. *Prinz Regent Luitpold*, which was expected to arrive in Colombo on the 29th ultimo. Mr. H. D. Elhart who is in charge of the Nuwara Eliya hatcheries would personally receive them from the vessel and immediately take the cases up to Nuwara Eliya. Other consignments are expected from New Zealand.

The London Tea Market.

Messrs. Gow, Wilson & Stanton's weekly telegram, dated 28th ultimo, reports that competition in Ceylon tea is general and well distributed, and the market for fine teas is dearer ; while the market for Common Pekoes and Broken Pekoes is steady. The price of fair liquoring Ceylon Pekoe Souchong is 5d. (a farthing up) and the average price of Ceylon tea sold on garden account this week was 6⅜d. (same as last week)—as against 6½d. and 7⅝d. respectively in the corresponding week last year. Reuter reports that good qualities of Ceylon teas have realised full rates. Pekoe Souchongs are quoted at 3⅝d. (same as last week) and the average for the week at 6½d. (one-eighth of a penny up) as against 7⅛d. quoted for Indian tea. 30,000 packages of Ceylon tea were offered for sale, of which 28,000 were disposed of ; while of the 32,000 packages of Indian tea offered 28,000 found purchasers.

Speculative Dealings in Coffee.

Statistics have been posted on the New York Coffee Exchange giving the cost of carrying a pound of coffee on the Exchange. In the case of a pound of coffee cost 5c, charges are figured as follows : Storage, insurance, weighing, interest at 6 per cent., and probable loss of wei are all included, but not grading or brokerage char Storage, per month, 4c per bag ; insurance, 40c on $100 year ; weighing, 2½c per 100 pounds ; interest, 6 per c perannum ; loss in weight, three pounds per bag ; about points. For the different periods of time the cost is as lows : At the end of one month, 5·20c ; two months, 5·2 three months, 5·32c ; four months, 5·38c ; five months, 5·4 six months, 5·50c ; seven months, 5·55c ; eight months, 5·6 nine months, 5·67c ; ten months, 5·73c ; eleven mont 5·78c ; twelve months, 5·84c.

The Ceylon Tea Kiosk.

The *Ceylon Observer*, of 1st insta remarks :—We have to record to- that the Ceylon Tea Kiosk which has hitherto fulfilled purpose of supplying a *pucca* specimen of "the cup t cheers but not inebriates" has ceased to exist from da During the past few days there was a fair amount of patron and those interested in the concern must certainly have pleased at the manner in which a fair proportion of the la number of Russian sailors now in harbour patronised establishment, the want of which will be felt not only visitors to our port but also by the residents of the town. is already known, the site is to be utilised for the purpose erecting the Jubilee statue of the late Queen Victo Government has offered the proprietors of the Kiosk, Ceylon Tea Company, (which holds a meeting of shareholde to-day at Kandy), R10,000 for the recovery of the s To-day the furniture was being shifted in view of the auct sale of all the appurtenances at 11 a.m. to-morrow.

Coffee in London.

The *Produce Markets' Review*, 9th February, says :—In the termi market, although the daily receipts have kept very heavy a much above the average, an entirely altered tone has tak place. Early in the week a fall of nearly 1s. was establish but towards the close this has not only been recovered, b prices are fully 1s. above last Saturday, and there is app ently a strong "bull" feeling. This is due partly to a stea advance in the exchange, and also to the figures which ha just been published of the stocks, deliveries, etc., on t 1st instant. The reduction in the world's visible supply given at 21,000 tons, and the most is made of this, yet it i time when a reduction usually takes place, and last year was even larger than this. Without any advice of dama of any kind to the growing crop, it seems too much to ma a great deal of such a small reduction, for it is quite evide that there will be no shortness of stock at any time this ye but that, unless there is a very large increase in the consum tion, the world's stock at the end of the year will, in probability, be much heavier than now. At the auctio supplies are still on a small scale, and prices are stead finest Costa Rica showing some advance.

Quinine in Central India.

The sale of quinine at post offic in the Rajputana and Central Ind agencies was continued during the year 1900. The comp rative statement of sales for 1898-99 and 1899-1900 giv underneath shows a net decrease of 13,268 5-grain powde The powders sold during the year under review repres nearly 15 lbs. of the drug valued at Rs.313-0-6 as agai 24 lbs. valued at Rs.520-5-6 sold in the previous year. T

les by village postmen amounted to 1,476 powders as against 228 disposed of by them in 1898-99 :—

POSTAL DIVISIONS.	Sales, 1898-99.	Sales, 1899-1900
pper Rajputana ...	5,469	2,618
ower ,, ...	8,467	3,564
ewar .	7,401	2,653
alwa	11,965	11,199
	33,302	20,034, decrease 13 268.

he cause of the very large falling off in sales in the ajputana portion of the circle is unaccounted for, and has een made the subject of special enquiry.

razilian Coffee. Total value of Brazilian Exports in 1900 amounted to £18,601,129, which no less than £17,499,533 was represented by coffee one. The *Brazilian Review* remarks :—The difference 1,101,595 represents the total value of all other exports, ncluding Specie, Gold Bullion, Manganese, Mangabeira ubber, and Ox Hides. Results could not be more insignifiant or deplorable. Practically the activity of a population xceeding 6,000,000 distributed over an area as large as urope, abounding in Mineral and other sources of wealth, restricted to the cultivation of a single article—coffee—the pply of which already exceeds the demand, whilst supplies ven of foodstuffs are drawn chiefly from abroad ! How rious the situation of such a community would be were the offee industry to be destroyed, as it was by blight in India nd Ceylon, does not require to be enlarged upon. We have ut all our eggs into one basket and must take the consequences. Of late there has been an active movement in favour greater variety of cultivation that has done much already to bstitute native grown for imported cereals, and not only ust this policy be persevered in, but every effort to develop e great mining industry be encouraged by more liberal and mpler laws.

eylon Tea. In Mr. J. J. Street's report for the *Australasian Mail*, of 25th ultimo, it stated :—Offerings during the fortnight have again shown slight reduction. Prices show a wider range, low common ubbish further receding, while quality grades show expanon. Considerable irregularity exists. Estates hitherto producing poor tea, and now making better, suffering for their rmer bad reputation. It will take buyers some little time realize that these marks are worth tasting again. Quality many instances shows improvement, although there is still considerable quantity of undesirable quality offering Green as were almost entirely withdrawn, in the absence of bids, emand not being able to cope with supplies The Planters' ssociation has passed a resolution that the plucking area of a be reduced ten per cent. If this be adhered to, it will ndoubtedly raise prices. This, in our opinion, does not uite meet the case, as the supply of useful, good and fine tea *not* in excess of Trade requirements. A scheme which ould lead to finer plucking and more care in, and knowledge manufacture is what is wanted. Do away with the production of coarsely plucked and badly manufactured teas and e industry will right itself, and prove profitable to the lanters, and Ceylon Tea a more satisfactory article to those at handle it.

Indian Tea in London. The *Produce Markets' Review*, of 9th ultimo, says:—The demand is active, and a large business continues to be transacted, while, except for the common and less useful medium kinds, values have not materially changed. The fine and finer descriptions are well bid for and sell freely, which is due to the gradually diminishing supply, and prospects appear favourable to a firm and probably advancing market. Most of the finest qualities now coming forward are of a fine autumnal flavour, and where this is the case the competition for them is active, and improved prices in consequence have resulted. Medium teas giving a good infusion have been largely dealt in at former rates, and as these kinds form the principal portion of the consumption there is likely to be a well-sustained inquiry. The less desirable and thin liquoring sorts of the same grade met with but moderate attention, and where sales have been effected prices have shown a decline. A considerable business has been done in the lower sorts, but the quantity is ample to meet this increased demand, and values have fallen to a lower level than in the preceding week. The statistical position for the past month and in January, 1900, is as follows :—Imports 23,122,000 lbs and 18,634,000 lbs. respectively ; the deliveries being 18,256,000 lbs. against 17,489,000 lbs., which, it will be noticed, is considerably above the average, and is due to heavy duty payments made in anticipation of a possible rise in duty. The stock shows a large excess over last year, the figures being 74,788,000 lbs. and 62,629,000 lbs. respectively.

GENERAL ARTICLES.

RUBBER.

In Brazil several laticiferous trees exist from which rubber is manufactured. In the State of Ceara the Manihot Glaziovii, locally known as the macoba, is fairly extensively worked, and considerable attention is being paid to its cultivation. In the State of Maranhao the Hancornia speciosa, or manabeira, is beginning to give results. These trees, however, are unimportant compared to the Hevea brasiliensis, or seringueria, to which the Amazon Valley owes its present prosperity.

The Hevea brasiliensis is found scattered through the forests that clothe the banks of the Amazon River and its tributaries. In some parts it is much commoner than the other and for no apparent reason. Very large tracts of forests are to be found where it does not exist or is very scarce. It is generally met with in the swampy parts of the forest. Owing to the lack of trustworthy data on the subject it is not possible to state with certainty the proportion of Hevea compared to other trees existing in the forest. However, for districts where it is very plentiful, and for areas of 1,000 acres or more, about one tree to every two acres may, I think, be taken as fair estimate.

The Hevea brasiliensis does not strike the eye amongst the other innumerable varieties of trees to be met with in the Amazonian forests and is often difficult to detect. A peculiar glistening of the trifoliate leaves and the whiteness of the bark serve as a guide to the practised eye. The tree grows to the height of 70 to 100 feet, and has, as a rule, when full grown, a girth of from 5 to 7 feet at a height of 1 yard from the ground. The trunk is generally free from branches to a height of some 30 or 40 feet from the ground. The tree flowers in January; the seeds ripen and begin to fall in March in the case of old trees, and in May in case of young trees. The seeds are contained in a hard shell, two, three or four in each shell, which hang by a short stalk from the upper and outer branches. When ripe the shell explodes often with quite a loud report, scattering the seeds to considerable distances. For this reason it is difficult to procure seeds. When collected the seeds should be packed in powdered charcoal and sent to their destination without delay. I am informed by a competent authority that they are

not as a rule fertile if kept for more than three months after being collected. This fact would account for the difficulty experienced in rearing this plant in Africa, Ceylon, and other parts.

Setting aside scientific phraseology and distinctions, there are for practical purposes, three distinct varieties of the "seringueira" to be met with in the forest. These are locally known as the seringueiras "casca vermalha" (red bark) "barriguda;" (bellied), and "casca preta," (blackbark). The first of these, the "casca vermelha" grows in the higher parts of the forest which are seldom or never flooded. The latex which it yields is scanty, thick, and will not run. It is, therefore, of little value.

The second of these, the "barriguda" so named, because the trunk increases very rapidly in thickness towards the base, grows in those parts which are almost constantly flooded, named "igapos." It yields plentifully a thin watery latex which is of little value.

The third variety, the "casca preta" grows in those parts where a certain amout of drainage exists, and which form an intermediary zone between the permanently flooded parts and the high land. It is this varity which yields the latex from which the rubber of commerce is manfactured.

The "latex," or as it is commonly known, the "milk of the tree, is a milky juice contained in special tubes running amongst the other tissues of the plant. These tubes in the case of the Hevea are connected, forming what is known as the "laticiferous system." The latex is quite different from what is called the "sap" and probably does not play any part in the nutrition of the tree. According to some authorities, it forms a reserve of water to be drawn upon in cases of drought. The actual extraction of latex cannot kill the tree, and the common statement that the trees are "bled" to death is a mistake. As a matter of fact, though trees exhausted, inasmuch as they will not yield anymore latex, are common, actually, dead trees killed by overtapping are rarely met with. The latex, as it exudes from the bark is of a dazzling whiteness, resembling milk, which it also resembles in composition, inasmuch as it consists of an emulsion in which "caoutchouc" takes the place of the "butter" in ordinary milk. The fluid part of the latex consists of water with very small quantities of albuminous matter, organic acids, and phosphates in solution.

The extraction of the latex, or as it is usually called, the "tapping" of the tree, is effected by making an incision in the bark of the tree. From this incision the latex flows for about three or four hours, after that it stops flowing of its own accord. The incision should not penetrate beyond the bark, which is generally about $\frac{3}{8}$ inch thick, into the wood of the tree, and for this reason a very small axe, which rapidly thickens, wedge-like from the cutting edged is used, the shape of the intrument preventing it entering too deep. The axe is generally about $\frac{3}{4}$ inch wide. The custom is to strike with it a back-handed blow upwards, thus making an oblique cut in the bark. It is probable that a better method would be to use a chisel and mallet and make a V shaped incision. Recent experiments at Henaratgoda have shown the advantage of this shaped incision.

This incision having been made, a small tin cup of a capacity of about 4 ozs., is affixed justbelow it to receive the latex which as it flows. This is effected by pressing the edge of the cup is sharp, into the bark until it gets a sufficient hold to remain firm. By this method, however, a second wound is made in the bark which is injurious. No better method has as yet been suggested. In some places a winding groove is cut in the bark of the tree, and by means of a clay breastwork the milk is conducted into a vessel placed at the foot to receive it. This method is found, however, to be very exhausting to the tree and is falling into disuse. The usual mode of tapping is to make an incision with the axe at a height of some 6 or 7 feet from the ground; on a level with that incision and at a distance of some eight inches, a second cut is made, and so on round the tree. On the next day incisions are made just below these and so on day by day until they reach the ground. Incisions are then made on the same plan beginning as before from the top, and working down wards between the former rows. A tree that will carry seven cups 8 inches apart is considered a large one, and though trees that will carry eight or nine cups are to be met with, the average do not carry more than four or five. It is not possible in the present state of the industry to give any precise data to the average yield of latex per tree. To begin with, the trees are extremely irregular in their yield. Two trees growing close together and under apparently precisely similar conditions, will often vary very much as regards their yield of latex. Some trees are very rapidly exhausted, while others have to tapped for some time before they yield the full amount of latex which they are capable. The natives account for this by saying that the tree has to be accustomed to being tapped. Sufficient data are not available to enable any judgment to be formed as the correctness of this view. It is certain, however, that even the most experienced cannot judge of the value of a rubber est before at least a year's work has proven it. The examination the books of a number of rubber estates actually working a from reliable information received, leads to me to believe th for estates working with over 20 men, a yield of 300 kilos. annum per man may be expected should it be a good distri 200 kilos. should the district be only fairly good; and 100 ki per annum works 200 trees this would place the yield for tree, when worked under satisfactory conditions at 1 to 1½ ki per annum. On the same basis and taking the whole of the c from the Amazon district as being 24,000 tons (a out) per annu there would appear to be about 120,000 labourers employed in c ting rubber at present Calculating still on the same basis th should be some 24,000,000 trees being tapped, and these on a ba of one trees to every 2 acres would give an area of about 50,000,0 acres of forest at present being worked for rubber. When it considered that the district in question embraces well over 1,000,0 sqire miles, and that it is by no means easy to find virgin rub forests within 200 or 300 miles of Para or Manaos. it will be se how comparatively scarce is the Hevea in the Amazonian forest

The Hevea is found to yield its latex more freely at the b than higher up the trunk. In some places. however, where t trees have already been considerably worked, and the lower part the trunk is already covered with knobs due to excessive tappi it is the custom to build stagings in order to enable rubber-cutt to reach a higher portion of the trunk. A good tree will still yi freely to a height of some 20 or 30 feet.

If allowed to rest for three or four years, even a completely hausted tree will quite recover itself. the tree is not killed wh the supply of latex runs short, and as a rule sufficient dama has not been inflicted to prevent the tree from recovering its This fact is important as owing to it the supply of rubber availa will probably not run short as has been often prophesied of la Trees have been known to have been tapped off and on during years, and to be still yielding a plentiful supply.

The latex having been obtained and collected the "caoutchou or rubber known to commerce, may be obtained from it in vario ways. The only method however, that has met with practi success it that of evaporation by which the watery portion of t latex is driven off and solid caoutchouc remains. The object to secured is that as little water and proteid matter shall remain the caoutchouc, the putrefaction of the caoutchouc, owing to t presence of these matters being extremely detrimental to its elas properties, and, therefore to its market value. In the Amaz district the method followed is to light a fire upon the ground a to invert over it a specially constructed funnel-shaped chimn From the narrow end of the funnel which is open, the smoke a heated gases pour out in a concentrated form. The fuel used the fire consists. as a rule, of chips from any hardwood tree th grows handy to the labourer's hut The nuts of the "Urucu palm" (Attalea excelsa) are sometimes used. their smoke containi a trace of acetic acid and creosote being found particularly effect in curing the rubber and preventing putrefaction. It is, howev a mistake to suppose that all or even a large proportion of t rubber coming from the Amazon district is cured in this way. is, on the contrary, very rarely that the rubber-cutter will be at t trouble to collect these nuts, he nearly always prefers to use wo chips which give him less trouble to procure.

The fire having been made, and a large stream of hot smo pouring out of the chimney, the operator seats himself on a sm stool by the side of it. The latex is contained in a basin placed hand In his right hand he holds a paddle-shaped piece of woo in his left hand a small calabash. Dipping the calabash into t basin of latex he pours a small quantity over the paddle which then revolves in the smoke issuing from the chimney. That havi dried in a layer over the paddle he repeats the operation. course of time a "ball" or "biscuit" of solid rubber is thus forme In some parts where it is the custom to manufacture very lar balls or "pellets," an arrangement is made by means of a pivot rotate the ball over the chimney. The wooden core is withdra through a slit made in the "biscuit," or simply drawn out in t case of the "pellet."

The latex of a tree named "Maoaranduba" (Mimusops elata), nd more often that of a tree named locally "Amapa," is sometimes sed to adulterate that of the Hevea. In both cases the adulteraon is extremely prejudicial to quality of rubber produced. hree distinct qualities of rubber are manufactured in this dis-ict named "Fine," "Entrefine" and "Sernamby" respectively. Fine" rubber has been well smoked, is free from putrefaction. Entrefine" rubber has been either burnt whilst being smoked, or as been insufficiently smoked, and has therefore putrified. It is ue to carelessness on the part of the workman, which it should be ossible to avoid. "Sernamby" is the "negro-head" of commerce, nd consists of scraps, mixed with dirt, or strips peeled of the bark f the tree and mixed with impurities of sorts.

A very important factor, from the merchant's point of view, in ne rubber trade, is the loss of weight that is constantly taking lace in raw rubber. This loss is extremely variable, and a congnee. has to place the greatest faith in the consignor that the nvoiced weight of rubber has really been shipped, as more or less nortage invariably takes place. Moreover, the shrinkage in weight so variable that no exact figures can be quoted by which it may e calculated. The cause being the evaporation of the water conained, it varies according to the quality, being greater in the case f the porous "Sernamby" than in the firmer "fine" rubber. he longer rubber is kept and the larger the pieces the less it oses in weight. Dry "sertao" rubber coming from distant parts hence shipments are only made once a year will lose only about per cent. between the estates and Manaos; whereas newly-made ubber coming from close at hand will lose as much as 10 per cent. s the means of communication get more rapid and the rubber reaes Manaos sooner after being manufactured, the tendency to lose weight becomes large. Between Manaos and foreign markets loss of 4 per cent. may be taken as an approximation of the averge loss in weight.

A machine designed on the principle of a cream separator to eparate caoutchouc from the watery part has been tried, but has ot proved successful as regards the latex of the Hevea, though ood results have been stated to have been attained with the latex f the "Castilloa."

Another means of separating the caoutchouc as to add chemical eagents which cause the latex to coagulate. Of these, ascetic acid nd corrosive sublimate have been found to give the best results. he latter owing to its antiseptic properties, would appear particurly suitable. A solution of alum is used to a small extent in the tate of Matto Grosso, to prepare rubber from the latex of the Hevea.

The following analysis of the latex of the Hevea brasiliensis is iven by Seeligman:—

	Analysis per cent.
Caoutchouc	32
Nitrogenous matter	2.3
Salts	9.7
Resinous matter	traces
Water	55 to 56

COFFEE IN THE UNITED STATES, 1900.

During the calendar year, 1900, the movement of coffee in ne United States and Europe was as follows:—

	Bags.	Bags.
Stocks, January 1, 1900—		
Europe	4,021,401	
United States	1,079,692—	5,101,093
Arrivals during 1900—		
Europe	8,422,861	
United States	5,511,910—	13,934,771
Total supply for 1900 ...	...	19,035,864
Less stocks, January 1, 1901—		
United States	1,031,610	
Europe	3,881,735—	4,913,345
Deliveries during 1900 ...	...	14,122,519
Deliveries during 1899 ...	...	14,891,499
Decrease in 1900 ...	...	768,980

The deliveries in the United States were 5,559,992 bags, and in urope 8,562,527 bags—a total of 14,122,519 bags.

The world's visible supply compares as follows:—

	Bags.
January 1, 1900	7,560,345
January 1, 1901	7,036,093
Increase in 1900	524,252

The receipts in Rio and Santos for the calendar year compare as follows:—

	Bags—1900.	Bags—1899.
Rio	2,809,000	3,508,000
Santos	6,500,000	6,394,000
Total	9,309,000	9,902,000

From the above statements, says the *American Grocer*, we find that the total supply of coffee last year exceeded the deliveries by 4,913,345 bags.

The average annual requirements of Europe and the United States will not exceed 14,500,000 to 14,750,000 bags, to meet which there will be a grand total of nearly 20,000,000 bags. When supply outruns consumption prices fall. A decline has taken place from the high figures of a year ago. In 1893-94 No. 7 Rio sold in New York from 15¾ to 18⅜ cents, with a Brazil crop of 4,309,000 bags. In 1899-1900 the price ranged from 5 7-16 to 8 13-16 cents; for the calendar year 1900, the range was from 6¾ to 10 cents.

Does this drop of over 50 per cent. measure the extent to which a decline should go? That is a question each must answer for himself.

COFFEE.

The following is taken from a statement issued by the Board of Trade:—

The production of Coffee, like that of Tea, is largely increasing, and may be said, speaking generally, to have doubled in the last ten years The chief producing countries are all in America, Mexico being the most northern, and Paraguay the most southern of the countries of that Continent where Coffee is produced. The chief countries of production, in the order named, are Brazil, Venezuela, the United States of Colombia, Mexico, Costa Rica, Guatemala, and Hayti. It is difficult to get any reliable official returns even of export (except in the case of Mexico), much less of production. Estimates have in some cases been made by individuals for trade purposes, but with these it is not necessary to deal here. The only official statistics that exists are those of the importing countries, and with these it is possible to deal with some degree of accuracy.

The United States holds a very similar place in the Coffee trade to that held by the United Kingdom in the Tea trade, the relative consumption in each case exceeding that of all the other countries of the civilised world put together. The Coffee trade of the United States, therefore, may be said to virtually control the trade, as well as to a certain extent the prices of Coffee throughout the world. It appears desirable, therefore, to deal at some length with the United States trade in Coffee, and the fluctuations thereof in recent years.

In past years the imports of Coffee into the United States have been large, although not nearly so large as they have been during the last year or two. The following statement shows the quantity of Coffee imported for home consumption into the United States at various periods since 1870:—

IMPORTS OF COFFEE FOR CONSUMPTION INTO THE UNITED STATES.

Years (ended 30th June).	Total lbs.	Per head of the population lbs.
1870 ...	231,000,000	6·00
1875 ...	311,000,000	7·08
1880 ...	440,000,000	8·78
1885 ...	539,000,000	9·60
1890 ...	490,000,000	7·83
1895 ...	643,000,000	9·22
1898 ...	851,700,000	11·45
1899 ...	801,700,000	10·55

The above figures represent the imports of Coffee "for consumption" into the United States. The total imports are rather larger, the re-exports of Coffee varying much from year to year, having been less than 4 million lbs. in 1894, and over 30 million lbs. in 1885 and 1899. On an average the re-exports of Coffee varying

much from year to year, having been less than 4 million lbs. in 1894, and over 30 million lbs. in 1885 and 1899. On an average the re-exports may, however, be stated to approximate to 16 million lbs., which is not a large figure as compared to the enormous amount imported. The greater bulk of the Coffee imported comes from the largest Coffee-producing country, *viz.*, Brazil; the second largest quantity coming from Venezuela. The following statement shows the *total* imports of Coffee into the United States from the chief countries of production during the last three years:—

TOTAL IMPORTS OF COFFEE INTO THE UNITED STATES.

Years (ended 30th June).	From Brazil lbs.	From Venezuela lbs.	From Colombia lbs.	
1897 ...	542,857,000	58,913,000	20,940,000	Total Imports, 1897-9, lbs
1898 ...	661,009,000	62,983,000	26,866,000	737,646,000
1899 ...	628,418,000	61,955,000	28,169,000	870,514,000
	From Mexico lbs.	From Costa Rica lbs.	From Guatemala lbs.	831,827,000
1897 ...	28,834,000	19,300,000	11,570,000	
1898 ...	34,721,000	13,749,000	12,443,000	
1899 ...	27,325,000	16,626,000	14,925,000	

It will be seen from the above statement how very large is the quantity of Coffee imported into the United States, and also how considerably the imports have recently increased. There is, it may be remarked, no duty in the United States on Coffee imported into that country. During the last sixteen years the declared value at the point of importation has fluctuated very largely, having been as high as 10d per lb. in 1892, and under 4d. in 1886, 1898, and 1899.

Three-fourths of the Coffee imported into the United States comes from Brazil, and it is consequently the price of the Brazilian product which chiefly controls the average price of the whole; but it is worthy of observation that while the average price of Brazilian Coffee has fallen from 20 cents (10d per lb.) in 1891 and 1892 to 6 cents (3d per lb.) in 1898 and 1899, the value of Costa Rica Coffee has at the same time fallen only from 19 cents in the former period to 14 cents in the latter, and Guatemala Coffee from 16 cents to 12 cents.

The quantity of Coffee consumed in the United States has, as already stated, risen from 500 million lbs. in 1884-5 to over 800 million lbs. in 1898-9, the consumption per head having risen at the same time from over 9 lbs. to over 11 lbs. Whether this large increase is due to the fall in the price of Brazilian product and its consequent increased cheapness, or whether it is due to the decrease in the consumption of alcoholic beverages which has taken place in the United States of late years, is a moot point. Probably it is due in some measure to both these causes.

The Coffee trade of the United Kingdom is of very much less importance than the United States trade in that article. The larger part or approximately two-thirds of the total imports of Coffee into the United Kingdom are re-exported. Of the remainder less than 30 million lbs. go into consumption annually, as compared with 800 million lbs. in the United States. Consequently in the latter country over 10 lbs. of coffee are consumed per head of the population, whereas in the United Kingdom the consumption is approximately 0·70 of a lb. per head. Indeed, in the United Kingdom the consumption of coffee is rather decreasing than increasing, having rather over than under 0·90 of a lb. per head of the population in the years 1884 and 1885.

Of the coffee imported into the United Kingdom the largest amount comes from British and Ceylon, though a certain quantity is also imported from the United States, Brazil, Colombia, Guatemala, and Costa Rica. The price of the coffee at the port of landing in the United Kingdom has also fluctuated though not perhaps quite to the same extent as in the United States, having been over for a lb between 1890-97, and as low as 6·82d in 1885 and 7·24 1899. The Coffee re-exported from this country is sent chiefl Germany, Holland, and other countries of the European contin

The European country in which Coffee is most taken is Germ where at the present time three hundred million lbs. go into sumption annually, which is equivalent to over 6 lbs. per head o population; for many years past the annual consumption of coff that country has exceeded 5 lbs. per head of the population. Co therefore, as a beverage, may be said to hold much the same in Germany as Tea does in England. The price of Coffee at the of landing has fluctuated in Germany much as it has in the Un States, having been as high as 10d per lb. in 1890, and under 5d lb. in 1898-99. The Coffee consumed in Germany comes ch from Brazil and Central America, and also to some extent from Dutch East Indies and from Holland. The following staten shows what has been the importation into the German Empire f each of these countries during the last three years:—

IMPORTS OF COFFEE FOR HOME CONSUMPTION INTO GERMANY.

Years.	From Brazil Kilogs.	From Central America Kilogs.	From Dutch East Indies Kilogs.	From Holland Kilogs.	Tota Impo Kilog
1897 ...	60,924,000	21,265,000	14,000,000	11,044,000	136,
1898 ...	83,417,000	17,563,000	12,553,000	9,732,000	153,
1899 ...	82,995,000	22,199,000	11,289,000	9,799,000	156,

Note.—The kilog. is equal to 2·2 lbs.

INCLUDES COSTA RICA, NICARAGUA, HONDURAS, SAN SALVADOR, A GUATEMALA.

The Import duty in Germany on raw Coffee is slightly ove per lb. as compared with a duty of 1½d per lb. on the United Kingd

France is also a large consumer of Coffee, taking annually ab 170 million lbs., are approximately half of what is consume Germany. The per capita consumption in France amounts to ra over 4½ lbs. per annum, which may be considered large in view relatively high import duty amounting to 6d per lb.

The consumption of Coffee in Austria-Hungary is rather un 100 million lbs., or approximately 2 lbs. per head of the populat

The other European countries consume Coffee, but in m smaller amounts. In Italy the annual consumption amounts t million lbs, or much the same quantity as that consumed in United Kingdom. In the Russian Empire approximately 18 mil lbs. are consumed.

With regard to the British Colonies it is to be observed tha the Dominion of Canada over 5 million lbs. of Coffee are consu annually; the consumption, therefore, amounts to 1 lb. per hea the population as compared with, approximately, 10 lbs. in United States; in both countries raw Coffee is imported free.

In Australasia the consumption of Coffee is but small, amount to approximately 2 million lbs. per annum, or about ½ lb. per h of the population.

In most European countries import duties are levied on r Coffee, the highest being, France 6d. per lb., Italy 6½d., Austria 4d. Germany levies a duty on Coffee of slightly over per lb., and Norway, Denmark, and the United Kingdom of appr mately 1½d per lb. In the United States Coffee as previou stated is imported free.

The following statement shows the import duties per lb. on r Coffee, with the approximate present value at the point of land for the latest year available:—

	United Kingdom.	Russia.	Germany.	Holland
Import duty:	d.	d.	d.	d.
Coffee per lb. ...	1·50	4·11	2·18	Free
Value per lb. at point of landing:				
Coffee	7·24	8·26	4·47	4·00

——	Belgium.	France.	Italy.	Austria-Hungary.*	Uni Sta
Import duty:	d.	d.	d.	d.	d
Coffee per lb. ...	0·43	5·92†	6·53‡	4·02	Fr
Value per lb. at point of landing:					
Coffee... ...	5·23	4·80	3·93	4·50	3·3

* Import duty and value of Coffee imported by sea.
† Minimum duty by Treaty.
‡ Special duty on Brazilian Coffee 5·66d per lb.

THE ART OF SINGING.

BY SIMS REEVES.

"Remedies for the Throat."

"All kinds of lozenges for the voice are to be avoided; some do harm, others have no effect, and none do good. Sugar and water, or a little glycerine, gives relief when the throat is inclined to be dry; this applies to persons whose throats are affected by the weather. About a third of a teaspoonful of Condy's Fluid in a tumbler of water, if used as a gargle every morning, will clear the throat and brace up the uvula, which, in some singers, is so long that it interrupts the pure emission of the voice, and introduces a grating undertone, while it also tends to make a tremolo on the upper notes."—*The Idler*, February, 1900.

THE INDIAN TEA INDUSTRY.

"Mr. Spaker," said an Hibernian M. P. on a memorable occa-on, "in the course of a life long experience, I have invariably oticed that single misfortunes never come alone, but that the reatest calamities are always either preceded or immediately llowed by disasters of even larger proportions."

This remark unfortunately seems to hold good of the Indian Tea dustry, which having already received in the Currency Legis-tion of the Government of India in 1893, and the increased duty posed by Parliament in 1900, two very severe blows, is now reatened with further disaster in the proposed legislation of the overnment of India and the rumoured further enhancement of ity with the coming budget.

We print in another column the proceedings of an influential eeting of those interested in tea, held at the Bengal Chamber of ommerce last Friday, and would invite the serious attention of e Government of India to the remarks of the various speakers, l of whom spoke with a sense of responsibility, and with a knowl-ge of what they were talking about.

It is no light matter to cry havoc on an industry like this. The in of the Tea industry will spell disaster to the coolies whom the overnment of Assam desire to take under their paternal care. e would advise the Government not to take the Chief Commis-oner of Assam too seriously, the earthquake of 1897 has much to nswer for, and they will find that in Assam cotton manufactures e a very poor substitute for tea.

We understand that the London Tea Association have wired to e Tea Association here that no extra duty on tea is anticipated, t urging the Association to support them in agitating for a re-uction in the present duty. It is curious that Mincing Land ould have been so differently informed in this matter.—*Capital.*

NOTES FROM BRAZIL.

(From the *Brazilian Review.*)

Exchange.—The present improvement of exchange is attribu-ble to two causes: one natural, better prices for coffee during the rly part of the year with the consequent improvement in the arket value of investments, and the other artificial, the conse-uence of interference with the volume of the currency and the rced restriction of imports. During the latter part of the year e advantage of higher prices for coffee gradually disappeared, nd, independent of other causes, a fall in the market value of vestments was to be expected. This natural process which had ready commenced in July was, unquestionably, greatly accele-ted by the Banking *debacle* of September, that not only locked up rge sums of money thus further restricting the demand, but by rowing enormous quantities of securities on the market also rfeited the supply. Apart from the transitory effect of panic, ere is no doubt that the market is over-supplied with investment nd will continue so as long as the present impoverished condition its productive elements prevail. There may be spurts, but any eady improvement can only come from increased demand and at, principally, from improvement of economic conditions. The me rule that is being employed with the currency must be ap-ied to securities, and their quantity reduced to a level more mmensurate with the demand for investment, if prices are to be nproved and maintained. The present *debacle*, which is attribut-d generally to the government policy of restriction of currency nd over-taxation, was in any case the inevitable result of the rinkage of earnings and, consequently, of the purchasing power the community at large entailed by the depreciation of their incipal and, practically, exclusive product, coffee, and, though e simultaneous monetary stringency and additional burden of xation that the government's policy gave rise-to unquestionably ggerated the symptoms, they did not originate them nor would ey disappear even were that policy abandoned.

Extremes during the week ending January 18 were 9 7/8—10 1/4d. r 90 d/s Bank paper and 9 15/16—10 5/16d. for private.

The average Bank 90 d/s counter drawing rate for the week comes t at 10 1/32d. the corresponding sight rate being 9 31/32d., ainst 10 1/16 d. the average sight rate of the *Camara Syndical.*

The average depreciation for the week, calculated on the basis of e Banks' sight rate, is 63·07% and the premium on gold 170·82% ainst 63·94% and 177·36% last week.

Ninety days rate on London opened on Monday, 14th instant, at 9 15/16d. rose to 10 1/4d. during the week and finally closed this evening weak at 10 1/32d.

A few weeks ago we ventured to predict that rates might not impossibly reach 10 1/2d. in the course of the current month and if our somewhat venturesome forecast has not been yet actually verified, events have, at least, proved that it was not so unfounded as at the time generally believed. Without extraneous assistance of any kind rates rose since the beginning of the year 1/2d. Naturally a rise so violent could not be unaccompanied by speculation and was bound to create a reaction when covering commenced, but the tendency during the last two weeks, in the face of the uniformly depressing outside influences of every kind, points unmistakeably to the equilibrium of purely local factors. In spite of a 5% Bank rate and the financial crisis in London: in spite of the news of the Boer war and the postponement of several undertakings that were looked on as imminent: in spite of the miserable prospects of coffee, the depreciation of the sterling price of rubber, and increasing remittances on account of the Treasury, rates have not only refused to respond, but have positively risen! The fact is symptomatic of an equilibrium momentary, possibly, but effective, between the demand and supply, that is to be attributed more to the slackness of demand than the importance of the supply, because not only were declared sales here and at Santos 29,000 bags under the previous week's and 46,000 under those of the corresponding week last year but their value has even fallen to only 35s. per bag compared with 41s. this time last year.

At Pará, too, the value of rubber going forward has been insignificant for the time of the year, only £410,000 shipped from the 1st to 15th of the month. The requirements of the market are more reduced than ever, as not only were the imports, which are now being paid-for, on a much smaller scale than the previous year's but, owing to late failures and suspension of payments, private remittances are on a much smaller scale than usual. The tightness of money, on the other hand, prevents any attempt at deliberate "bearing" and is, in fact, the powerful factor of the situation. . . .

It seems likely that rates will oscillate slightly above 10d. for some time and until new coffee bills considerably supplement actual supplies.

Estimates.—There is nothing to add to the previous report regarding the future crop, which is now generally estimated at 11 to 12 million bags, the former being regarded as a decidedly low estimate. From the outset the weather has been extraordinarily favourable and even a prolonged drought, of which there seems little chance, would only slightly affect the weight and quality.

Reports with regard to the coming crop continue to be optimistic. On one large fazenda the coming crop will be at least 30,000 bags. It is, however, well to recollect that so enormous a yield is *certain* to be followed by a very small crop in 1901 and 1902; in this particular instance not over 5,000 bags being counted on. It is this factor that must be taken into account and, were it possible, it would be wise for planters to hold back as much coffee as possible for next year and not spoil their own market by rushing their produce down. On the large and richer fazendas this we hear will be done, but in many cases the want of money will make it impossible.

CEYLON PRODUCTS.

The Report of the Committee of the Ceylon Chamber of Commerce for the half-year ending 31st December, 1900, contains the following references to *Exports:*—

1. *Tea.*—The year shows a large increase in export of tea, *viz.* 18½ million lbs. over 1899, but the prices obtained for many medium and low-country crops were at times under cost of production. More careful plucking will, it is hoped, remedy prices in 1901.

The attention of the Chamber has been drawn to one or two shipments of bad teas to the United Kingdom and Australia. It cannot be too strongly impressed upon growers that the manufacture of such teas tends to lower the demand for Ceylon kinds among consumers and they are earnestly desired to see that nothing is packed which is not sound tea.

The increase in duty from 4*d.* to 6*d.* per lb. is unfortunately not likely to be reduced for some time to come, owing to the larger expenditure in connection with the war in South Africa.

2. *Green Teas.*—These received more attention last year than in previous years from Ceylon, and a good demand existed for a short time for America. Towards the close of the year supplies increased considerably and somewhat exceeded demand, and prices paid locally show a severe drop.

3. *Plumbago.*—The reaction which set in at the close of 1899 was intensified during this year, and notwithstanding that the quantity exported fell off by the large total of 11,500 tons as compared with 1899, prices have also given way considerably. The exceptional prices ruling early in 1899 led to undesirable qualities being mined, which at ordinary times would not be worth attention. Prices for medium to fine qualities are, however, still good compared to those ruling prior to 1898.

4. *Cinnamon.*—Quills and chips both show a large increase in volume exported, and prices have at the same time been very good. The shipment of wild cinnamon has almost ceased. It has been "found out" and is now practically unsaleable in London.

5. *Products of the Cocoanut Palm.*—All these show a large increase in quantity exported, and prices have also been good all the year round. The industry seems to have a good future before it. *Copra* towards the close of the year reached a very high level in price.

6. *Cocoa.*—Crop was very short, but good prices were paid for large bright beans.

7. *Cardamoms* show a fall in value, but at the same time the crop was a large one, and prices still bring good returns to the grower.

The undernoted Comparative Statement of Shipments will be found of interest:—

	1900.	1899.	1898.
Coffee ...	10,773 cwts.	18,542 cwts.	13,313 cwts.

CINCHONA BARK.

Under the headline "Our View of Bark and a Broker's," the *British and Colonial Druggist* remarks:—

Readers who have followed our articles on cinchona and quinine during the last three years will be specially interested in a letter recently issued by Messrs. Woodhouse & Co., the well-known bark brokers. There is nothing remarkable in the fact that this firm interprets the figures relating to cinchona as we do, for it is difficult to see how anyone taking a wide survey of the situation can come to any other conclusion. The only people who doubt the evident conclusion are those who expect that if the natural position of an article is strong the article should stand any amount of rushing by speculators without having reactions. Messrs. Woodhouse's way, however, of putting certain points are, perhaps, curiously like ours. As the letter is lengthy, we can only, of course, refer here to scattered passages.

First, the fact is noted that 1900 is memorable as being the first for many years in which the value of the unit in bark did not fall below 1d. per pound, and the price of quinine below 1s. per ounce The average units for bark were for 1900 10·13 cents in Holland and 2d. in London, as against 7·05 cents and 1⅜d. in 1899, and 4·78 cents and 1 5/6d. in 1898. One noteworthy point to which we drew attention is here emphasised—*viz.*, that whereas in 1899, at the point when the unit reached 10·90 cents, manufacturers raised quinine to 1s. 9d., in 1900 the alkaloid was never above 1s. 7d., though 12·25 cents was the unit in September. A calculation is also made, showing cost of quinine in bark, this cost *plus* that of manufacturing, and the selling price. Taken in the order named these factors are:—1900, 1s., 1s. 4d., 1s. 5½d.; 1899, 8d., 1s., 1s. 3d.; 1898, 5½d., 9½d., 11d. This reveals at once how the general trend of bark and quinine has been strongly upwards, and how a healthier situation is being promoted by the closer approach of cost and selling pri In the broker's letter the cost of manufacture is put at 4d. per o we think 3d. is a fairer figure.

Turning to the question of consumption and production, so carefully compiled tables are given, which, however, we will lea for later consideration. At present we may simply say that t conclusion from these is the one we have repeated again and aga *viz.*, that consumption has overtaken production. In these tabl the production is probably stated rather too low; indeed, alkaloi other than quinine sulphate are purposely excluded. The figur given for the last three years, set out as ounces of quinine, are follows:—

——	1900.	1899.	1898.
Production	12,261,000	12,447,000	12,855,000
Consumption ...	14,818,000	14,861,000	14,464,000

Thus we have been drawing on stocks of bark, that in Lond having fallen from nearly 20,000 packages to less than 10,0 Allowing for the increase in stocks of quinine, the net reduction the last year of bark and quinine stocks is given as 1,213,000 o of the latter.

Moreover, Java bark has been falling off in quality as well quantity. In 1897, 5,315,000 kilos. offered gave 10,256,000 ounces quinine; in 1900, 5,260,000 kilos. only gave 8,735,000 ounces. Abo 900,000 ounces of quinine have been sold in Java during 1900. Th manufacture locally has undoubtedly had a marked influence, stated, of forcing European makers to maintain a good unit for ba and a low price for quinine. Java planters have thus the matter their own hands (irrespective of financial obligations), and, if th behave sensibly, we ought to see higher prices still this year.

TRAVANCORE TEA ESTATES COMPANY, LIMITE

The ordinary general meeting of the Travancore Tea Estat Company, Limited, was held at the offices of the Company, Eastcheap, on the 4th ultimo.

The chair was occupied by Mr. W. Mackenzie, Chairman of t Company.

The Secretary (Sir William Johnston) read the notice convenin the meeting.

THE CHAIRMAN'S SPEECH.

The Chairman, in moving the adoption of the report and accoun said: I do not think I ought to begin the business of our meeti without expressing our deep regret at the death of Her Majesty t Queen and our sympathy with the Royal Family. Since our la report death has deprived us of the very useful services of o colleague, Mr. Tod, and Mr. Talbot, another of our directors, abroad. The report and accounts you have had for some days, a unsatisfactory though they be, may, I presume, be taken as rea The crop was 128,000 lbs. more than the previous year, because the larger area being plucked. But for the absence of rain, whi caused the Indian famine, and the excessive downfall of the la two months of our financial year, August and September, wh 3 in. fell daily on an average, the yield would have been conside ably larger. In the report you are told that 1,702 acres ga 304 lbs. per acre. But, as you will see, one-half of that area w immature tea. For the current year the estimate from the sa area is 743,000 lbs. I say the same area, because nothing of a consequence can be gathered this year from the 1,500 acres, mo or less, planted in 1898. During the first three months of th financial year to end of December the crop from the 1,702 acr has been 49,000 lbs. more than for the same three months of la year. More serious even than the falling-off in crop from the b weather has been the fall in tea prices. In the early half of t year we were doing well, and we were quite justified in paying t interest on preference share to end of March. But the unprecede ed fall which has occurred since then has upset all calcul tions, and has brought the average price from 7·18 in the prev ous year to 6.20, a drop of ·98 of a penny per lb. The avera price of Ceylon teas since June has been 7·48, against 8·42 the prev ous year, and Indian teas is also all but 1d. lower for same perio The yield we anticipated four years ago has been realised, exce

uring the final months of last financial year, when first drought using famine, and then an excessive rainfall lost us nearly 50,000 s. of tea. The cost of production from mature tea has been less an we expected, the price alone is responsible for our present fficulties. Another misfortune we have to record is the loss of bout £2,800 in advances to native contractors. This money was ven out three to four years ago, when we were preparing for the rge development in acreage made in 189-. The acting manager ho advanced this money has been resident in Travancore for many ears, and was well acquainted with the native contractors. He as home here a year ago, and was then confident he could recover ree-quarters of the money on his return. As yet, however, he has ot been able to do so. This advance system is universal in the ast, but is seldom attended with loss in Ceylon. In some of the reat tea-producing districts of Northern India, however, it is quite nderstood that labour costs R100 per head, for a coolie, and it is eldom that any of this is recovered. In Travancore we trust this ay be our only loss under the heading. The result of the several isfortunes I have mentioned, the loss of crop from bad weather, ne fall of 1d. in price, and the loss on these advances, is a deficiency our resources of about £6,000. To cover this we propose to issue 7,000 of Preference shares, and if your and our property is to be rotected something equivalent to this is absolutely necessary. At ne present moment the average price of our tea is 1¼d. less than st year's average of 6·20d. and this means that it is being produced t a loss How long this is to continue we, as Directors, have no etter means of forming an opinion than you have. Were it to go n for years, then it were better not to throw away more money, ut to allow the properties to pass to the Debenture-holders. ut pessimistic as we all are at present, I doubt whether any ne in this room really believes that prices are not to rise ithin a reasonable time. The laws of supply and demand will ssert themselves. Planters will not go on producing 500 lbs. o 600 lbs. per acre at a loss of 1d. per lb., when they can roduce 400 lbs. of a better tea which may show no loss. The emand is increasing all over the world. The crisis has been rought on us by the great success of the tea-planting industry our to six years ago, which induced Companies to open up hunreds of thousands of acres, the produce of which has swamped the arket during the last two years. I might say much more in xplanation of the position, and as encouragement for the future. ut I refrain, as we have no wish to persuade shareholders against heir convictions. I do not even wish to advise them. As Directrs we can merely make suggestions. It is for you to decide. ut failing this scheme, the only resource known to us, short of anding over to Debenture-holders, is a re-construction, or rather re-arrangement, with a call on the shares. The sum we propose o raise, *viz.*, £7,000, is what appears to us sufficient for the present. ut it must be clearly understood that with a continuance of preent prices, the whole of this might be used up in paying Debenture nterest, and the difference between cost of production and sale rices; but such a condition of things, though we cannot, of course, ay it is beyond the range of possibilities, we can only hope may ot arise, as the enormous tea industry of India and Ceylon would n that case also become involved in a general disaster. We show ou in our report what we expect from the working of the Company our teas fetch 6½d. per lb. when the land is in bearing. The rice is 2d per lb. below that at which the Company's teas stood hen the Company was formed, and if you think that is a fair and easonable figure to assume when production and consumption ave adjusted themselves, then I think you should have no hesiation in subscribing for your share of the extra capital. The natter rests entirely in your hands, however, and you must judge r yourselves. With regard to the Debenture issue, I may state hat when the Company was formed there was not the slightest ntention of issuing Debentures. It was stated in the prosectus that the first issue of shares was for the purchase and orking of four estates, therein named aggregating 2,371 acres. t was also stated that further lands would be acquired and eveloped. This latter entailed the raising of more capital, and ne total acreage is now 7,163 acres. The Directors considered that he issue of debentures presented the best and cheapest form of aising the necessary capital. The Directors were of opinion that he Company from the first would be a success, and there would be o difficulty in raising Ordinary and Preference share capital when was required, but as the price of tea gradually fell and tea nvestments were not in public favour, they saw clearly it would not have been possible to obtain the necessary capital from the shareholders. The contemplated acreage of development was very materially curtailed but what was begun had to be brought to completion. The Directors have given constant and anxious attention to the affairs of this company from its inception to the present time, without fee or reward of any kind, and respectfully maintain that as they could not foresee that Travancore teas would fall from 8·50 per lb. (the price when the prospectus was issued) to an average of 6·20 per lb., the present state of the Company's finances is solely attributable to low prices. Anyone experienced in tea cultivation knows that £35 per acre is a reasonable price at which to bring tea into bearing with buildings and machinery, so it cannot be said the shareholders' money has been squandered. No new clearings of tea have been made for the last two and a half years, land it is practically three years since the land was opened out, roaded, and drained, for planting up. The properties are good, and have been well cared for, and the whole position entirely rests with the future market price of the produce, which we must all hope will soon take a turn for the better. I now move the adoption of the report and accounts.

Mr. H. K. Rutherford, in seconding the adoption of the report and accounts, said: I would add a few words to what has fallen from your Chairman, and to recount the history of this Company. It was started in 1897 as a Tea company to develop and open out Tea estates from jungle lands, having as a nucleus a certain acreage of land under tea. The land was reported on most favourably by the Ceylon manager of the Ceylon Tea Plantations Company, a gentleman of very high standing and experience in tea cultivation—and we have no reason, even at the present moment, to doubt the capabilities of the land to be less than he estimated. The principal vendors were your Chairman and Mr. Knight, our manager in India —two gentlemen of the highest probity. The price paid was a reasonable one, and I believe they could, had they been anxious to do so, have sold these properties for cash to others, but they were desirous of retaining a large interest in the concern, as they had absolute confidence in the potentialities of the property. That interest your Chairman afterwards considerably increased by purchasing a large number of shares. Your Directors, from their intimate connection with tea, shared in the confidence of the Chairman, and had not the slightest hesitation in investing and joining in the management of the Company. Let us now consider why results have fallen so much under our anticipations. There is one fact, very patent, that it is not over-capitalisation that is the cause, as the price at which our estates stand is a fair normal cost for opening out and equipping tea properties, and therefore the Company stand at practically bed rock price without inflation. When we negotiated for these properties exchange stood at 1s 2½d, and the price of the teas at 8½d, and at the present time the former is 1s 4 15-32d, and the latter 6¼d. When I have stated that simple fact I have stated the whole of our case. I do not know if any shareholder has taken the trouble to apply the condition of exchange and the price of tea in 1897 to the accounts in this report, but if so, you will find that had these two factors held good, instead of showing a loss we would have earned Debenture and Preference interest and 7 per cent. on the Ordinary shares, and further, if you continue the application to the estimate of crops which it is practically certain the estates will yield, the Ordinary shares would earn something like 50 per cent. dividend. I ask you, therefore, as reasonable men, even if after allowing what one would consider a safe discount in the 1897 conditions of exchange and price of tea, if it can be said any of us —either we as Directors, or you as shareholders—went rashly into this venture. Shareholders may complain to-day of minor matters of finance in our accounts, which in a successful concern might have been looked at as virtues, but, believe me, the real crux of our position is the price of tea. If you believe this state of things cannot continue in the tea world very long, then you ought to keep this Company afloat. It has potentialities if tea recovers, and if you stick to the ship I have no doubt whatever that you will reap a fair return in due course. So serious is the position of tea producers at the present moment that efforts are being made to bring all into a co-operative movement to reduce the output of British-grown tea for this season in India and Ceylon. If we make no profit whatever out of our estimated crop of 743,000 lbs. of tea, then our debit balance, after paying Debenture interest, will be some £8,200, and therefore the £7,000 we ask you for would not suffice, and we would again require to come to you. We do not wish to call upon you for one penny more than necessity demands, and it becomes a

question for you to decide whether in the meantime it would be better to make this call in the hope that it may be sufficient to tide us over, or at once re-arrange the Company. No one could have foreseen the difficulty, and we must leave the matter in your hands.

Mr. Dangerfield thanked Mr. Rutherford for his remarks, and stated that although the position was an unfortunate one, the explanations given would. he felt sure, meet the views of the shareholders. He also asked how the required capital was to be raised.

The Chairman stated that the Directors would leave the shareholders to decide how that was to be done. They were, however, prepared to put it *pro rata*. The position of the tea market was accentuated since the report was drawn out. The market might fall again to-day, and they could not say what might happen. They did not anticipate a month ago what had now happened. That being so, the Directors would not pledge themselves that the amount, as stated in the report, would be sufficient. The call would be spread over a number of years, and would be made as easy as possible.

The resolution for the adoption of the report and accounts was then put to the meeting, and carried unanimously.

Mr. D. Reid proposed the re-election of Mr. Rutherford as a Director. He remarked that in doing so it was no easy task he was asking Mr. Rutherford to assume. He had always carefully watched over the interests of the Company, and had devoted much time and thought to their interests. They had been deprived of the assistance of Mr. Mackenzie, the Chairman, for a greater part of the year, as that gentleman had been travelling in Canada and the States with the object of trying to raise the consumption of Indian and Ceylon tea. He (the speaker) joined the Board of this Company four years ago, believing that it had good prospects, and that tea from Travancore would realise a good price. The Directors could not foresee that such a mass of tea would be thrown on the market. He thought it would be very unfortunate for the shareholders to throw up the sponge. He believed the depression would pass away, as a great industry, such as the tea industry, could not go on as now. The Directors were all willing to lend a helping hand. They did not get any fees, and the item for keeping the books, etc., was a mere trifle, so there was no such thing as bolstering up the Company.

Mr. Dangerfield, in seconding the proposal, remarked that the shareholders could take it for granted that the whole of the Board were acting in good faith. He had perfect reliance in them, and believed that if the Company could be pulled through they would do it.

The resolution for the re-election of Mr. Rutherford was then unanimously agreed to.

On the proposal of Mr. Worthington, seconded by Mr. Dangerfield, the auditors were re-elected.

The proceedings closed with a vote of thanks to the Directors.

MARKET REPORT.

[*Per Mail advices of* 15*th February* 1901.]

COFFEE.

The London Commercial Record says:—The supplies at auction during the week have been on a moderate scale, and a fair proportion found buyers at irregular prices. Mocha was all bought in, but privately business has passed in long berry at 70s, and short berry at 80s to 82s. Bold colory Costa Rica is in request and higher prices have been paid, but for the bulk, as well as for Central American descriptions generally, the market has been rather in favor of buyers. Mexican sold at a decline of 1s to 2s per cwt. The market for "futures" has been influenced by the rise in Brazilian exchange, and March Santos reached 31s 6d per cwt. but has eased down in the last day or two on profit-taking sales, the closing quotation being 31s per cwt. Yesterday March sold at 30s 9d to 31s, May at 31s 3d to 31s 6d, September at 32s, and December at 32s 4½d to 32s 6d. To-day the auctions went off very slowly, with values unchanged for all descriptions. Supplies included 413 bags East India, 2s casks, 1 tierce, 5 barrels, 19 bags Plantation Ceylon, 102 packages Mocha, 36 bags Nyassaland, 149 packages Jamaica, 2,050 bags Costa Rica, 1,404 bags Guatemala, 1,040 bags Salvador, and 1,181 bags Unwashed Dumont. We quote:—

TEA.

Indian.—Rather less was brought forward at auction, the tot being 54,400 packages, compared with 57,500 packages in t foregoing week, and 39.000 packages a year ago

Extensive clearances in anticipation of the Budget, reaching fro 2½ to just under 4 million lbs. per diem, have occupied the time a capital of the trade, and adversely affected the market. Biddi was consequently languid, and prices tended lower for mo descriptions, while a considerable quantity was withdrawn owi to unsatisfactory offers. Common to fair, both leafy and broke receded ¼d to ½d per lb in value, and medium, particularly Peko were also cheaper. Fine and finest went irregularly and in favo of buyers, though choicest lots held their own. Several "last the season" invoices were printed, and when possessing a touch cold weather flavour commanded attention. Of the 2,000 packag

m South India submitted, the majority were of unattractive aracter and results disappointing.

Only 25,000 packages are advertised for next Monday, many porters being unwilling to accept current rates. It is satisfac-ry to see that according to the figures given below business with tside quarters is increasing, the exports from London during nuary being double those of 1900.

For 50,000 packages on Estate Account 6⅛d per lb. was obtained, ntrasted with 8⅛d per lb. for 32,200 packages and 9¼d per lb. for ,200 packages in the two previous seasons.

CEYLON.—Catalogues comprised 30,100 packages against 27,900 ckages on the 5th instant and 24,800 packages at this period elve months since.

Competition was less brisk and much unevenness prevailed. ekoe Souchongs ahd Pekoes under 6d per lb. showed a fall of ¼d ½d per lb., the medium sorts and Orange Pekoes, too, ruled sier. Broken Pekoes with inferior style and cup marked a rinkage, and for the better kinds quotations were very erratic, a cided decline being apparent in some instances, whereas in hers little change was noticeable. The small proportion of finest tched full figures. There was a fair number of orders from the ntinent, the exceptional opportunity now presented for making rchases evidently attracting shippers.

The average is barely 6d per lb. On the 7th instant it stood at d per lb,, and 7½d per lb. in 1900.

JAVA.—Nearly 1,800 packages of direct import passed the mmer, and in sympathy with other growths were dull of sale. bout 1,400 packages are advertised for the 21st instant.

Deliveries.—The clearances of all Tea (on which duty has been id) from the London warehouses, as per official returns are, z.:—

From 1st to 12th February, 1901 ... ... 25,194,295 lbs.
Do. do. 1900 ... ... 7,831,162 „

During the week the following have been printed for sale by blic auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	32,546	21,820	54,366
Ceylon	20,370	9,773	30,143
Java	994	770	1,764
Total ...	53,910	32,363	86,273

Also 99 packages from second hands.

PIMENTO.—Quiet, but steady. 116 bags offered and 38 bags ld—ordinary to middling 2⅝d to 2¾d per lb.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon and Java Tea Report, dated February 15th, 1901, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
00-1901	1,264,585	926,036	41,394
99-1900	1,289,297	875,333	43,328

,909 *pkgs.* INDIAN
,521 „ CEYLON
,764 „ JAVA
} Total 89,194 packages were offered in public auction this week.

During the calendar year 1900, 12½ million pounds more Tea re exported from India, and nearly 19 million pounds more from eylon than in 1899, making a total increase of over 31 million unds from the two countries.

With such heavily increased production and consequent collapse the Tea market, it is satisfactory to learn that the Indian and eylon Associations are now issuing a circular to proprietors of ea gardens, with the object of reducing the output for the coming ason.

Duty payments have continued on a very large scale, lbs. 29,525,597 aving been cleared in January against lbs. 37,238,954 last year, hen there was also an agitation in reference to the duty, and s. 17,991,818 during January, 1899; while from the Beginning of ebruary to the 13th inst., duty was paid on lbs. 27,571,122 against s. 8,251,049 same time last year.

The result of these heavy clearances is seen in the severe de-ression which has come upon the market, buyers having to provide nds not only for the payment of duty, but for the immediate moval of duty paid Tea from the warehouse. These operations sorb so much capital, that buying for stock to retain in bond is cessarily somewhat restricted, with consequent limited market mpetition. Prices have now reached a figure which may soon ing fresh capital into the trade.

INDIAN.—The downward trend of prices still continues except for really good liquoring Teas, common and medium grades showing a further fall, amounting in some instances to ½d. per lb. with a very irregular market.

Week's average of Tea sold on Garden Account 1901, 49,319 pkgs., av. 6·12d. 1900, 32,570 pkgs., av. 8·14d.

Total Tea sold on Garden Account 1st June 1900 to date, 1,046,087 pkgs. av. 7·32d. 1900, 1,006,442 pkgs., av. 8·36d.

CEYLON.—Common and medium descriptions again showed a decline in value, a fall of ¼d. to ½d. per lb. being frequently recorded. The few Teas with special point in liquor continue in demand.

Average for week 5·88d. against 7·39d. in 1900.

Ceylon Tea sold on Garden Account 1st Jan. to date, 176,997 pkgs., av. 6·48d. 1900, 180,434 pkgs.. av. 7·58d.

JAVA.—Sold with considerable irregularity, although the depression in this market was somewhat less pronounced than among other growths, owing to the support given to this class of Tea by exporters.

Bank Rate 4½ per cent. Exchange on London three months sight:—Calcutta 1/4 9/32. Colombo 1/4 5/16.

COCOA.

There is no alteration in the conditions previously ruling; West India still tends lower, foreign growths are slow but steady, whilst fine Ceylon continues to realise full values, the trade for the medium and common grades being slow. At auction on Tuesday 7,194 bags were brought forward of which 2,600 bags sold. Of 868 bags Trinidad about 500 bags found buyers at about last week's rates—good to fine red 68s to 71s. Of 1,876 bags Grenada 850 bags were placed at a decline of 6d, *viz.*:—Fine red 65s 6d to 66s 6d, common to good 62s to 64s. 146 bags Jamaica about half sold at 64s 6d to 65s for good to fine. 138 bags St. Lucia partly disposed of at 62s to 64s for common to good. 8 bags Colombian sold out of 61 bags offered, at 59s 6d for common gray, 22 bags Sanchez realised 64s. 28 bags wormy and defective Esmeralda brought 60s to 63s. Of 98 bags Buba, one lot sold at 63s. 105 bags African catalogued and 70 bags sold at 64s for ordinary. Of 2,704 bags Ceylon 1,050 bags sold at valuations for the best lots but at comparatively low prices for the less desirable qualities; fine bold red brought 96s to 102s 6d, middling to good bold and medium 78s to 90s 6d, common to fair dull medium 66s 6d to 75s, and smalls 54s 6d to 69s 6d. 142 bags Dominica, 359 bags Samana, 151 bags Haiti, 40 bags Venezuelan, 379 bags Guayaquil and 73 bags Java all bought in. Privately about 500 bags Trinidad and Grenada sold at auction rates, also 400 bags Guayaquil at 80s for good Arriba, and 71s for Caraquez.

PEPPER.

BLACK.—The market has been dull in tone this week but is steadier at the close. For arrival 100 tons Singapore are reported sold at 6 7/32d down to 6 3/16d March-May shipment (s.), and at 6 9/32d for June-August, On the spot sales have been made at 6 1/16d for fair Singapore.

At public sale on Wednesday 80 bags light dusty brown from Singapore, but Penang character, sold at 5½d, whilst 92 bags Tellicherry, 1,214 bags Lampong 200 bags Aleppy, and 130 bags Trang all passed the hammer unsold.

WHITE.—The market is very quiet, and next to nothing done in the shape of business. Small sales of fair Singapore on the spot at 9 3/16d, and of fair Penang at 8½d per lb. For arrival the market has been a black.

At auction on the 13th instant 37 cases 317 bags Singapore were bought in at 9⅛d to 1s, also 276 bags Siam at 9⅛d to 9½d per lb., and 223 bags Penang.

To-day the market is dull and no sales for arrival reported. March-May Singapore 6 7/32d sellers.

GINGER.

COCHIN.—Demand has quitened down considerably this week, but the advance is well maintained. Some 500 bags sold privately since our last at 34s 6d to 35s for medium and small washed rough, and at same prices for rough Calicut Sorts. Under the hammer 136 cases 264 bags were offered and 3 cases 85 bags sold—medium and bold rather roughly cut and scraped 72s, small ditto 45s, ordinary medium and small dusty washed rough 33s, ditto mouldy 32s, sea-damaged cuttings 26s per cwt.

JAMAICA.—7 barrels small and lean, part dark, sold at 34s to 39s per cwt.

CINCHONA.

There was a brisk demand at the auctions on Tuesday, and as will be seen from the table below the bulk of the small supply offered found buyers. principally for American account. Prices were about 10 per cent. higher compared with the previous Amsterdam sale, the unit averaging fully 1½d.

The following table shows the quantity of goods offered and sold:—

	Packages Offered.	Packages Sold.
East Indian cinchona	746	610
Ceylon cinchona	318	243
Cultivated Calisaya cinchona ...	114	114
Java cinchona	90	90
	1,268	1,057

The following were the quantities of bark purchased by the principal buyers:—

	Lbs.
American factory	84,285
Messrs. Howards & Sons	39,170
Brunswick factory	31,145
Imperial factory	27,090
Paris factory	22,231
Frankfort-on-Main and Stuttgart factories	4,210
Mannheim and Amsterdam factories	2,748
Druggists, &c.	14,190
Total quantity sold	225,069
Bought in or withdrawn ...	58,485
Total quantity offered and sold ...	283,554

The following prices were paid:

South American.—Bolivian cultivated Calisaya, fair quill, 7½d to 8¼d; and thin papery, 4½d per lb.

Java.—Twigs, ¾d; Ledgeriana, stem chips, 3d to 4d; and root, 4⅝d per lb.

Ceylon.—Crown, chips and shavings, 2½d to 5d; broken quill and chips, 2¾d to 4⅛d; Hybrid, natural stem chips, 3¾d per lb.

East Indian.—Red chips, 2⅝d to 3¾d; root, 2¾d to 4⅝d. Natural branch, 2½d to 2¾d; chips, poor, 3⅜d to 3¾d; fair to good, 4⅛d to 5⅞d; rich, 6d to 7d; root, 5d. Renewed, 5¼d; rich, 7¾d to 9d per lb.

The monthly public sales of bark on Tuesday presented 1,262 packages for competition, and with a good demand about 1,050 packages sold at an advance of 15 per cent. on the prices realised at the Amsterdam sale, the unit value obtained being 1½d, against 2d at this time last year and 1⅜d in 1899.

114 bales *South American* all sold, at 4½d to 8⅛d for Bolivian cultivated Calisaya quill and 8¼d per lb. for broken ditto.

Of 318 packages *Ceylon Cinchona* catalogued 250 packages sold: Succirubra, chips and shavings 2½d to 4¼d, root 3⅛d to 3⅝d; Hybrid, chips 3¾d per lb.

Of 740 bales *East India Cinchona* bronght forward about 6 bales sold as follows:—Officinalis, chips 2½d to 6⅞d. shavings 3 to 7d, chips and shavings renewed 5¼d to 9d; Red, chips a shavings 2⅝d to 4d, renewed chips 8½d, root 3¾ to 5d: Ledgeria branch 4⅞d per lb.

90 bales *Java Cinchona* sold—Ledgerina, chips 3d to 4d, r 4⅝d per lb.

The shipments from Java for the first half of the month w 525,000 Amsterdam lbs., against 180,000 Amsterdam lbs. last ye

QUININE.

Sulphate of Quinine improved early in the week and sales HB and B&S were made up to 1s 2d spot and 1s 2⅛d May delive but later in the week on the Bark shipments being known, mark gave way and finished up 1s 1½d spot and 1s 1¾d May. Abo 100,000 ozs. sold in all.

Official Quotations.

After the close of our last report the market became dull a easier, owing to the United States wants being supplied for t present, and the week ended with small sales for spot at 1s 1¾ and may at 1s 2¼d per oz. This week the market opened easi again, with a small business at 1s 1½d for spot, but on Tuesd there was a slight recovery previous to and after the London ba sales, business being done on the spot at 1s 1¾d to 1s 2d, March 1s 2d, and May at 1s 2¼d. In auction 3,000 oz. of Taillandie brand sold at 1s 1d per oz. Since then, however, the market h been easier, owing to the heavy shipments of bark from Java f the first of the month (525,000 Amst. lbs.), and there are selle to-day at 1s 1½d. spot.

CARDAMOMS.

Cardamoms sold at unchanged but irregular rates, at the follo ing prices:—Ceylon-Mysores, fine bold long pale, picked, 3s 7 medium to bold ditto, 3s 5d to 3s 6d; dullish ditto, 3s 2d to 3s 4 good medium pale, 2s 6d to 2s 11d; long dullish, 2s to 2s 2d; sma and medium pale, 1s 10d to 2s 1d; small dull, 1s 7d; pale split a pickings, 1s 4d to 1s 7d; brown and split, 1s 4d. Seeds, 1s 9d 2s 3d per lb. Six cases of so-called wild Chinese seed sold "wit out reserve," at 2d per lb.

(Average for all India 6·12d., February 15th).

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 22nd instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Munzerabad. *March 11th.*—*Weather*—fine, wind westerly, temperature 62° to 86° in shade. *Works*—Pruning, weeding and manuring. Coffee is generally of a healthy colour, even though the crop is small; this is the trying month for supplies, and they should now be carefully seen to, a mulching or light shading is very beneficial. *Health*—Fair. A little fever about. *Interesting item*—A meeting is called at the Saklaspur Club to consider ways and means to preserve fish and game in the district. Preservation would be a great boon to the district, and we wish it every success.

Coorg. Polli Betta, 13*th March*.—*Weather*—Very hot and dry with high East wind at present. *Crop*—Gleaning of old crop still continued in parts. The blossom which the rain of the 19th and 20th ultimo brought out seems to have set having had clear weather. A good deal of blossom remains to come out. Pruning and manuring are being pushed on with. *General Health*—Fair.

THE RIVALRY OF CHINA TEA.

One of the chief dangers that we foresee in the event of India and Ceylon largely reducing the production of Tea is that any such course must necessarily encourage rivalry on the part of China. Englishmen are always prone to underestimate the strength of their enemy. It must not be forgotten that English enterprise and English capital are available in China as well as in India and Ceylon, for the benefit of the Tea trade as well as for general commercial purposes. Nor must it be thought that British merchants in China are indifferent as to the future of the Chinese Tea industry. This is very far from being the case. Reorganization of *likin* taxation and other influences adverse to the growth of the tea

industry in the Celestial Empire may be remote, but if Indian and Ceylon planters voluntarily handicap themselves in the race they do something towards reducing the disadvantages under which Chinese competition now labours. An ex-China merchant has warned Ceylon planters, through the medium of the *Colombo Observer*, that it would "be unwise to dismiss from one's mind the possibility of the restoration of the China Tea Trade." Probably regarding internal reforms in regard to Chinese taxation, etc., as too remote to be taken into account, this gentleman, Mr. M. P. Evans, has declared that nothing would stimulate this restoration of the tea industry in that country so much as "the growing inferiority of Indian and Ceylon tea." He does not hold that demand leans towards the cheapest, but asserts that it will inevitably go to the best, "as it did in the early days of Ceylon tea." Granted that these remarks open a wide field for discussion, granted that many planters will not accept them as statements of fact but merely as expressions of opinion; yet it would certainly be unwise to ignore the possibility referred to.

It is undeniable that there are, as Mr. Evans says, "fresh economic reasons resulting from political events of recent date in China, which render this possibility greater than before." Further arguments in favour of the avoidance of the dangerous policy under reference are stated. It is said to be a mistake to suppose that the trade, or the British public, are wedded to British-grown tea. When the China Tea Trade flourished not so many years ago, common Congou possessed a standard quality, it was regarded as the consols of the London Tea Market, and extensive time transactions were regularly effected in it: its understood value was 7d. to 8d. per lb. In those days there was always the equivalent of 250,000 chests of refuse tea kept in China, which was wisely considered too coarse for the markets of Europe, it was consumed in the native tea houses by the cooly class; but as demand for England and Russia increased, much of this inferior leaf was used for mixing, with the object of producing quantity, so as to meet this increased demand, the result being that, the standard of quality was lost in the London market, and the price fell away, gradually receding year by year, until 3d. to 4d. per lb. was reached, a price, which failed to pay the shipper. This inferior article ceasing to attract the trade was only bought at the price of rubbish, and this, coupled with deterioration of the better kinds from the same cause, brought about the decay of the China Tea Trade. If these statements by Mr. Evans are correct, it may be said that History has repeated itself, India and Ceylon having recently acted as China did some years ago. There has been a large supply of rubbish under the name of "tea." The standard of quality has been lowered, and the supremacy of the reputation of Indian and Ceylon leaf has been undermined. Even if we were to attach less weight to the above arguments than does the ex-China merchant whose remarks we have alluded to, we should yet feel it our duty to warn British tea-planters that there is sufficient evidence that improvement of quality is more to be desired, and is more likely to be found profitable, than reduction of quantity.

Broadly speaking, the solution of the Tea problem is a matter of calculation. Whether can planters generally make more money by reducing the area under cultivation while still plucking close, or by fine plucking, which would have the effect of improving quality and simultaneously reducing output. Individual experience may yield different results; individuals may not be willing to conform to the ruling of a majority. It is, however, obviously desirable the interests of the British tea-planting community that standards of Indian and Ceylon teas should be kept at a hi level, so that sales may not be retarded by any falling off the repute in which these teas have hitherto been held. Th may be instances where it will be more profitable to indi duals to produce quantity rather than quality, despite depressing effect that this must exercise upon prices Spe ing of the British tea industry as a whole, however, judge that the wisest policy is that which has for its obj the maintenance of such a standard of quality, combi with such a level of cost of production, as shall ensure the planter a steady demand for his product at prices t will yield him a reasonable profit. Another danger t attaches to the policy of curtailing the area is that ab doned tea shrubs will be much more likely than those un cultivation to breed pests and to assist in the spread blights. Pests and blights have a more or less migrat tendency; once bred in abandoned tea they will not s there, but will gradually spread to neighbouring shru Anything of this kind would materially handicap such t in the competition with China leaf; and the general effe of anything that retards British teas may, for practi purposes, be regarded as not very different from those of a special stimulus to China teas.

A PULPING MACHINE FOR LIBERIA COFFEE

In reply to an enquiry for information regarding the i provements applied to Butin-Schaap's Liberia Coffee pulpi machine, Mr. Graafland has been kind enough to furnish t *Revue des Cultures Coloniales* with information, of which t following is a translation :—

Amsterdam, 12*th December*, 1900

During the twenty-two years that I spent in Dutch In as a coffee planter, I have always tried my utmost to procu the best possible machines for the manipulation of coffee, b I have always experienced the greatest difficulty in pulpi Liberia coffee until the time I received, in 1897, the But Schaap pulping machine, which was preferred to every oth machine. This apparatus possesses, in my opinion, and the opinion of many others of my colleagues, the followi defects :—

(*a*) The machine is not of a neat construction.

(*b*) The grooved cylinders gets worn away too soon and can be set right.

(*c*) The pressing plate is almost beyond the reach of the wo man, and, to regulate it, the whole of the higher portion of t machine has to be taken to pieces.

(*d*) The *pulping* concern does not possess a cleaning apparat so that the machine gets easily spoilt by the stones.

(*e*) The pulping concern again consists of a double cylind system, which renders its regulation very difficult

And yet, the Butin-Schaap Method is even now recogniz as the best—the construction alone being below the mark f the aforesaid reasons; and it is therefore that I decided up getting for the Coffee-plantation I had under my manageme

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nich son's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf peo unable to procure the Ear Drums, may have them free.

Address—No. 989 D, The Nicholson Institute, Longcott, Gunnersbury *Lond*

[w. 26-5-00—26-5-1901.]

pulping machine which, while simple in construction, was onger and more moderately priced. The first experiments th these pulping machines sent to India in February, 1900, ve proved so satisfactory that my friends requested me to nd them similar machines,—a demand to which I have ven all possible satisfaction.

The maker here is busy just now in improving his works, d next month he will be in a position to execute every der in four weeks. Although the machines were originally ovided with cast steel cylinders, the pulping machines now ported are with strong wrought steel cylinders.

The cast steel cylinders were found sufficiently satisfactory, cause the Butin-Schaap pulping machine has these parts in st iron, but the solidity of wrought steel being very much eater, the maker has been induced to utilize only that metal spite of its increased cost, in order that his machine might be sound as possible. I have been myself very much pleased ith this machine, and, besides, I can mention to you the mes of Messrs. Waller & Plate of Amsterdam, who have nt for these machines for their plantations in Java. So lly satisfied were they with these machines, that their first ders have been followed by a second. Moreover, there are ready some pulping machines working in Sumatra, and r. H. des Amori van der Hoeven, a planter in Telock etoeng, will be able likewise to state that he has altered his tablishment in order to procure these pulping machines nich the *Indische Mercuur* has also said to be the best ailable. Should you be desirous of receiving the testi-onials of approbations which the maker has received, I am uite prepared to forward them to you.

THE PROPOSED TEA CESS.

A CORRECTION.

Mr. H. S. Ashton wires us as follows:—

"Misreported in your issue ninth. I spoke at Tea Associa-on Meeting favouring Cess."

[We greatly regret that there should have been an error in the vices that first reached us, but we are glad to welcome Mr. shton among the ranks of believers in a Tea Cess. A report of his eech is given on another page.]

NOTES.

nchona in London. A firm market is reported by cable, the price per unit being $1\frac{13}{16}$d. Total onthly sales, 1,700 packages.

ffee in London. Reuter quotes Mysore "B" Coffee 52s to 62s. Stock, 15,291 tons. Fort-ght's landings 3,500 tons; deliveries 1,800 tons.

coa and Chocolate in Ceylon. A Ceylon firm has set about the preparation of Cocoa and the manufacture of Chocolate. We wish them success.

eylon Green Teas. The *Ceylon Observer* understands that estates at high altitudes have opped the manufacture of green teas as there is no demand r that class of teas.

Cinchona in Coorg. As reported last year the planting of cinchona has ceased in Coorg, and even the better prices now said to be obtained for the bark have failed to reanimate the industry.

Cacao in Ceylon. The Cacao Committee of the Planters' Association of Ceylon has resolved to ask Government to import from Trinidad cacao plants of varieties showing marked strength and vitality.

Tobacco Cultivation in Victoria. After collecting the year's crop of tobacco the Government intends to close the tobacco plantation, as all the experiments in this direction have been a complete failure.

Tea in Coorg. The dry season proved disastrous to the tea planting in the Sampaji Ghât and it is feared that the syndicate which took up 2,000 acres for tea planting in the Sampaji Ghât have determined to close operations.

Rubber from Ceara Trees in Ceylon. Mr. F. E Tringham has shown the *Ceylon Observer* a very clean, superior sample of rubber, the result of tapping a single Ceara tree—four to five years old—on Pen-y-lan, Dolosbage. Trees giving so much for four hours' tapping are worth looking after and planting should be extended.

Pepper. Large quantities of Californian pepper seed are, says the *Central African Times* of December 15, being distributed amongst the planters of B. C. A. by the Scientific Department. At Zomba the seed has been a great success, and it will doubtless prove a workable and paying adjunct to the products of this country.

Ceylon Tea Exports and Green Tea. The *Observer* remarks:—We are glad to see that a separate heading for "green tea" has been opened this week in the Chamber of Commerce circular, the first shipment, curiously enough, being 1,840 lbs. for *Rangoon!* It is a pity the shipments of green tea since 1st January cannot be given; but it is good to have a beginning made, and we trust every lb. of green tea exported, will be separately entered henceforward.

Native-grown Tea in Ceylon. An old planter writes to the *Ceylon Observer*:—"In my opinion there was very little more acreage of native tea gardens in bearing in 1900, than there was in 1899, and 1901 will not much exceed last year. Owing to low price many of the small gardens are not weeded carefully. The rush of leaf in 1900 was caused by (1st) large Companies piling in manures, and (2nd) Kelani Valley, coarse plucking." But whence, asks our contemporary, came the unnamable "rubbish" which we fear is still going forward?

Ceylon Green Tea in Canada. The "Salada" Tea Co. lately received the following from The North Bay Supply Co., Limited, North Bay, Ont.:—

DEAR SIRS,—Our 30-lb. sample order of Brown label Ceylon green is sold right out, and our customers are very much pleased with it thus far. Kindly rush forward order for 500 lbs. sent you some days since. We believe this tea will displace our trade for 25c.

Japan; in fact, we are so sure of it that we have not given our usual import order for Japan tea. "Salada" tea right through from 25 to 50c. is becoming our leader, and if the year continues as it is starting, our business in "Salada" will be more than four times that of last year.

Amsterdam Bark Market. There was an advance of about 3 per cent. to-day 21st ultimo, in the auction unit says the *B & C Druggist*. Out of 37,058 kilos. of sulphate of quinine offered in the form of bark, 33,720 kilos, were sold. The druggists' bark among this contained 3,390 kilos. of quinine, of which 3,345 were sold, and the manufacturers' bark contained 33,668 kilos., of which 30,375 were sold. The unit was 7·50 cents per half kilo. (1½d. per lb.) against 7,25 cents at the last auction (nearly 1½d. per lb.). The shipments from Java for the first half of the month were 525,000 Amsterdam lbs. against 180,000 Amsterdam lbs. last year.

Tea Planting in Java. The *Straits Times* says:—Tea-growing pays so well in Java that the area under the staple shows increase. Yet capitalists, as a rule, shrink from investing money in this line of enterprise. The Batavia *Nieuwsblad* deplores this lack of interest at the present time, when coffee is on the down grade and when, owing to the abandonment of many coffee estates, thousands of labourers thrown out of employment can be started on tea-planting. Investors object that tea-growing stands under the disadvantage of no dividends being available in the early years of an estate. The reply is that this is made good by the heavy dividends sure to come once the estate has begun to bear.

Cinchona. The Vriessivum reports having received a telegram stating the Java bark shipments to be January 1 to February 18, 990,825 Amst. lbs. The shipments during 1900, were January 1, 1900, to January 7, 1901, 10,827,408 Amst. lbs.; January 1 to January 7, 1901, 140,825 Amst. lbs.—total for 1900, 10,686,583 Amst. lbs. The 1900 total tallies fairly with the total (10,780,000 Amst. lbs.) of the Nederl. Veem., but the shipments as above from January 1 to February 18 are so much smaller than the January shipments (Nederl Veem-1,000,000 Amst. lbs., and shipments first-half February, 1901, reported from London as 525,000 Amst. lbs.) that there is evidently a mistake somewhere.

Ceylon Tea in Canada. The *Canadian Grocer* states: Mr. R. D. Ross, who has been for so many years prominently associated with the tea trade of Canada, originally with the "Salada" Tea Co., and latterly as manager of the "Monsoon" Tea Co., is launching out for himself in connection with the Ross Tea Co., importers and packers of Ross' high-grade Ceylon teas. They have equipped a plant at 11 and 13 Front street east, Toronto, with the latest and most up-to-date machinery for packing tea in lead packets, and with a capacity for a large output. Mr. Ross enjoys the reputation of being one of the best judges of Ceylon teas in Canada, and, as he proposes to live up to, and not on, this reputation, a goodly measure of success should be the lot of the new company.

The Indian Tea Trade. Remarking on the proceedings of the annual general meeting of the Indian Tea Association last Friday, *Capital* says:—We are quite at one with Sir Patrick Playfair in considering it unsound policy to invite Government to impose taxati The Government is something like a shark, it has a v capacious maw and a very retentive one. The less Gove ment interferes with any industry the better; and all that planter should desire is to be severely left alone. Indust that are fostered and promoted by Government rarely h the strength and hardihood of those that grow alone. have already suggested that the tea industries could impo cess on tea by means of the selling brokers; but any in ference on the part of the Government is strongly to deprecated. The fable of the frogs who desired a ki should not be forgotten. King log is infinitely better t king stork.

The London Tea Market. Messrs. Gow, Wilson & Stanto cable, of 7th instant, to Colom reports that the demand is strong for fine kinds of Cey tea, and the market for medium liquoring Pekoes and Brok Pekoes as well as for Common Pekoes and Broken Pekoes steady. The price of fair liquoring Ceylon Pekoe Soucho is 5d. (same as last week) and the average price of Ceyl tea sold on garden account this week was 6½d. (one-eighth a penny up). There was no sale in the corresponding we last year and therefore the usual comparison cannot be ma Reuter reports that fine qualities of Ceylon tea sell at f prices. Pekoe Souchongs are quoted at 3¾d. (one-eighth u and the average for the week at 6⅝d. (also one-eighth up) against 7¼d. quoted for Indian tea. 35,000 packages Ceylon tea were offered for sale, of which 33,000 were dispo of; while of the 45,000 packages of Indian tea offered 43,0 found purchasers.

Tea Planters and Tea Dealers. Referring to some recent rema of ours, the *Ceylon Observer* say —"Our contemporary of *Plant Opinion* has some pungent criticism of the recent suppo action of our Planters' Association—'supposed' we s because the writer can only refer to 'legislation' as an int ference with individual liberty, and neither the Chairman any one in Ceylon advocated interference by law or anythi but voluntary action on the part of planters." Our rema did *not* only refer to 'legislation.' There is such a force public opinion, and this may easily be employed,— effectually as legislation, or almost so—to interfere w individual liberty. We are certain that many a planter w personally doubts the efficacy or the wisdom of the 1 reduction of area system will yield to public opinion so as to express willingness to give it a trial, thus permitt his liberty as an individual to be interfered with.

Coffee in London. The *Produce Markets' Review* say: As the new cropCoffees come forw in larger quantities there is generally a more settled mar established, and such is particularly the case this year, follo ing a time when, owing to a slow demand, it had beco almost impossible to accurately fix a value to many parc During the week there has been a much brisker busine and the catalogues have been all cleared in almost ev instance, while prices have shown a decided upward mo ment. There has been a strong demand for bold new c Costa Rica, and rates are fully 3s above the opening pri of the same marks. The quality, as a whole, has contin unsatisfactory for the home trade until yesterday, when a f

rcels showed an improvement and fetched correspondingly gh rates. The new crop of East India comes to hand owly, but some fine Mysore may be expected during the xt week or two. In the terminal market heavy receipts ntinue to check an advance, which a rising exchange would turally point to, and quotations close at practically the same ices as last week.

---

ffee in Coorg.

"The total area of coffee land was 1,02,214 acres against 1,04,545 acres the previous year. The cause of decrease was chiefly signations of old estates—one of the oldest of the Europeans' tates in province known as Fischer's estate, having area of 90 acres was resigned entirely. The area of assessed coffee nds held by European and Native owners respectively as llows :

	No.	Acres.
European estates	381	31,980
Native do.	13,454	70,234
Total ...	13,835	1,02,214

The coffee crop during the year was 2,760 tons against ,558 tons in 1898-99. As was anticipated in last year's eport, the unusual heavy rain in February and March seriously ffected the quantity of crop, but the quality of the crop was etter than in 1898-99 and better though as a rule not good rices were realized. The industry continues depressed, but he planters are not quite so dispirited as regards future rospects as they were." Thus says the Administration Report or Coorg, 1899-1900.

---

ndian Teas in London.

Although a smaller quantity has been submitted to public auction rices have been irregular, says the *Produce Markets' Review*, nd a considerable proportion was withdrawn. The large ithdrawals from the sales is in a great measure due to the ttention of the trade being practically absorbed in the duty ayments which continue very large. This abstention from eneral buying by the trade has caused an almost general ecline in values, common Teas having fallen to a price nprecedented. The medium and fine Teas have participated the downward course, the former from ¼d to ½d, the latter a less extent, while a few parcels above the average quality ave attracted attention, and have readily sold at better prices han last week. When these heavy clearances are discon- nued, it is probable that the market will be steadier, but uch will depend on the supply. If importers continue to talogue Tea in excess of requirements, the depression in alue will be more marked, as buyers during the past few eeks have bought freely and practically stocked themselves r the next two or three months. At the public sales 54,580 ackages were offered, and the large total of 21,098 packages ithdrawn.

---

rade Customs and London Dock Charges.

In a long letter to the *Public Ledger* of February 20, Mr. Samuel Figgis refers to the evidence given at he Royal Commission on Docks, &c., and asks if the London hamber of Commerce cannot assist importers and merchants proposing definite changes in trade customs. Under the tered conditions and small profits of importers, he suggests oing away with all discounts, selling everything at fourteen ys prompt net cash delivery, and urges a special quay-rate cover three or five days' rent ; all goods landed and weighed be taken at landing weights if these are within one month of sale ; any produce sold at re-weights to be re-weighed within three days of sale ; weights and tares (of low-priced produce) to be taken in drafts of five or ten bags ; no tret at all, and the doing away with all allowances, thus making accounts exact and cheaper, and working charges less, and enabling quicker despatch of accounts. These matters would, Mr. Figgis thinks, often make the difference of a merchant's commission of ½ to 1 per cent., and the further suggests that the Chamber of Commerce should ventilate the matter, as the produce associations are interested parties, and will not readily make the changes which they fear may injure their hold on clients.

Manicoba Rubber.

O. Araguary gives an interesting account of the progress of rubber planting in that district. The centre of the rubber plantations in the State of Minas is Bagagem where at least 150,000 shoots have been planted during the last two years. On one plantation the trees had already reached the height of 5 metres (16 feet 3 inches) some of them of little more than a year's growth. The trunks, however, have not developed in proportion and only measure so far, about 20 to 30 centimetres (10 to 12 inches). This plantation is situated on high gravelly soil and counts some 10,000 trees. The older trees planted 2 to 3 years ago show signs of abundant latex, which exudes from the tender shoots and solidifies on the stems. The growth of the trees was greatly retarded in the Winter months, from June to August, but afterwards the development was surprising, nearly 3 feet in three months. The trees were raised from seeds planted 3 together, the holes being at distances of 12 to 15 hands from one another in regular lines. Only one weeding is necessary per annum. The climate of Minas is cold, falling below freezing point in some localities during the Winter, and as *maniçoba* appears to be peculiarly susceptible to cold, it is necessary to choose the ground carefully. Within a few years the *maniçoba* industry may be expected to give important results.

LETTERS TO THE EDITOR.

ARSENIC.

SIR,—In your issue of January 19th of this year, page 43, one of your correspondents gives a note of warning against the use of Artificial Fertilizers for Coffee ; as the arsenic, the fertilizers might contain, might be taken up by the plants and act as a poison to consumers of the coffee. The article is logical and well written, and as the sources of information are given, must be convincing to a large number of your readers. But further reflection will, I think, show that there is no cause for alarm.

(1) Superphosphates have been used extensively for considerably over half a century and during all that time they were made, as now, by using impure sulphuric acid, (which is *liable* to contain arsenic) but no case of poisoning has been traced to the superphosphate.

(2) In America, Paris-green (an Arsenite of Copper) has been universally used for about 25 years as a dressing for potato vines to destroy the potato beetle, and no arsenic poisoning has been traced to the consumption of such potatoes notwithstanding that a considerable quantity of the poison must invariably drop on the soil in which the potatoes are grown.

(3) Although plants take up considerable quantities of arsenic when the latter is *dissolved* in solutions used for *water cultures,* only "infinitesimal quantities" of arsenious acid are taken up by the plants if this poison is contained in the *soils*, on which they grow as proven by, among others, Gorup-Besanez, in his article published in the "Annal der Chemie un Pharmacie," vol. 117, part 2, page 243. The assimilation of arsenic by plants has been a subject for investigation more than 50 years ago and it is therefore not a field likely to give startling revelations now.

(4) Without having a report of the "Manchester Analyst" or a copy of the "Lancet" referred to by your correspondent, it is impossible to enter into a discussion of these. They are contrary to the generally accepted opinion of men of science and this opinion is based on the experimental evidence of half a century. On what evidence the opinion of the writer in the "Lancet" is based is not stated.

(5) Arsenic when assimilated by plants (as for example in water cultures) is one of the so-called accidental constituents of plants. These are rejected by plants when forming their fruit. Therefore if the coffee trees assimilated arsenic this poison would not enter the beans. But as only infinitesimal quantities of arsenious acid (quantities too small to make the coffee tree a poison if it formed an article of food) enter the tissues of plants when growing on a soil containing salts of arsenious acid, coffee-planters may rest doubly sure that no arsenic poisoning can be produced by the consumption of pure coffee, even if the fertilizer used on the estates contained large percentages of arsenious acid, which is by no means the case.

Bangalore,
March 14*th*, 1901. A. Lehmann.

GENERAL ARTICLES.

THE CONDITION OF TEA.

The Produce Markets' Review, commenting on the Circular lately issued by a Sub-Committee of the Indian Tea Association on the subject of "How the present condition of Tea affects Producers," remarks :—

Judging from the enormous clearances of Tea during the past few weeks, there is a general expectation, not of a reduction as proposed by the planters, but of a further increase in the duty. The Chancellor of the Exchequer will, however, no doubt keep his secret to the last, and the trade will have to wait for the declaration of the Budget, until they see what is to be done. In the meantime the statement of the Indian Tea Association that the additional 2d per lb. on Tea has seriously injured the producers cannot be disputed. There can indeed be no doubt that the result on the public demand has been such as to seriously depress the price of Tea in bond, so as, at any rate partially, to make up for the extra duty. The sufferers, of course, have been our planters in India and Ceylon.

A good deal has been published with reference to a proposed combination to control and lessen, to a certain extent, the increased and increasing production of Tea, but it appears extremely doubtful whether any measure of the sort can be successful. The interests of those concerned are very divergent, and indeed in some cases almost irreconcilable as regards such a movement. Take for instance a comparatively new garden about to come into bearing, and on which large sums have been spent in previous years. If production is not allowed on the full scale, those who have been from year to year putting money in without return, would feel that they were suffering far more than the older producers who had no new land coming into bearing. As regards the fixing of the exchange at the artificial rate of 1s 4d, there can be no doubt that hitherto it has been injurious to local planters; but whether it will continue to be so is a matter for consideration, for theoretically, at any wages and other expenses should be decreased by a rise in exchange. The action of the artificial exchange on Tea is, howe economically peculiar. The Indian Empire is so vast, the diffic of communication so great, and the standard of economic educa so low, that the late depression in the rupee, while its effects very marked in external trade both in imports and exports, not had time seriously to raise the price of labour and so o India itself. It will be seen, therefore, that while the artificial hancement in the exchange is injurious to the planters, they not in a position to make the economies that may theoretically made in India.

While many difficulties may seriously interfere with form combination among the Tea planters, there can be doubt that condition of the trade at home loudly calls for alteration. It is only the Indian planters who have to complain of the condition Tea and the depression in prices, but the system of conducting business has of late years proved most unsatisfactory to the ho trade as well. Unreserved public sales and the unrestricted pu city of prices have removed the old inducement to hold stoc A great deal of capital has, therefore, been withdrawn from business, and, while there are infinitely more varieties and qualit of Tea than used to be the case in old times, the margin in val has to a great extent disappeared. The retail grocers in the sa way are not contented with the system which brings all Tea do practically to an almost uniform price, and at any rate to a pr which only permits the purchase of comparatively common kin and decreases the proper reward which should be reaped by th who pay special attention to the trade and endeavour to develop higher branches. Apart from the public sale system, which in present exaggerated form has proved injurious to distributors well as to producers, the Tea trade is organised in an obsolete a most costly manner. In fact, the expense of distributing Tea is n out of all proportion to the cost of the commodity or to the profit be obtained upon it. Under these circumstances it has been sugge ed that the various branches interested in Tea should meet togeth and endeavour to introduce mutual and beneficial advantages. similar course has been adopted with excellent results in oth branches of trade, and there can be no reason why Tea should be exception. In fact, we attach as much, or more, importance what can be done by an agreement at home towards placing market on a sounder basis, as to any attempt to interfere with p duction, or any movement based on the forlorn hope of a reduct in the duty.

THE UNITED STATES.

IMPORTS OF COFFEE.

The imports of coffee were 785,918,534 pounds, valued $59,510,771, against 878,198,029 pounds in 1899, valued at $56,068,9 The following were the sources of supply :

	Pounds.
Brazil	608,429,596
Other South America	56,052,222
Central America	43,961,550
Mexico	30,010,567
East Indies	22,224,166
West Indies	9,148,580
Other Asiatic countries	3,562,864
Germany	4,416,834
France	2,159,374
United Kingdom	2,128,942
Netherlands and other Europe	3,688,813
Africa and other countries	135,026
Total ...	785,918,534

From the above it appears that Brazil furnishes 77.3 per cent. the total supply, thus showing the dominant position that Repub occupies in the coffee market of the world.

The following statement shows the imports, exports, and imports for the year :

	Pounds.
Imports	785,918,534
Exports	44,625,914
Net imports	741,292,620
Net imports, 1899	851,645,477

The above shows a decrease in net imports of 110,352,857 pounds, 836,000 bags, as compared with the preceding year. The new ork Coffee Exchange report for the year made the 1900 deliveries 8,980 bags less than in 1899.

IMPORTS OF TEA.

The following table shows the imports, exports, and net imports tea:

	Pounds
Imports	96,384,696
Exports	1,176,736
Net imports	95,207,960
Net imports 1899	85,929,024

The Chinese Empire furnished 54,111,195 pounds, or 56 2 per ent. of the imports; Japan, 33,261,387 pounds or 34.4 per cent. of he imports; all other countries, 9.4 per cent., showing that there still a great field for British-grown tea.

IMPORTS OF COCOA.

The imports of cocoa for 1900 were the largest ever known, eaching 45,305,016 pounds of crude and 995,401 pounds of manuactured product. The exports were 2,228,632 pounds of crude and 085 pounds of manufactured, leaving net imports of 43,076,384 ounds of crude and 994,316 pounds of manufactured, as against et imports of 35,797,458 pounds of crude and 1,038,934 pounds of anufactured in 1899. This shows a wonderful increase in the se of cocoa and its preparation.

TEA-GROWING ON PAPER.

Tea-growing is becoming a newspaper industry in this country. bout 60 acres of land in Summerville, S. C., are laid out as a tea lantation, and the quantity of matter written about the enterprise ould hardly be greater if it promised to supply the entire domestic emand for tea, with some left over for Europe. But the industry ay grow more rapidly during the next decade than it has during he past five or six decades, for there is talk of capitalists in Conecticut having bought some thousands of acres of land near harleston, S. C., for tea raising proposes. and it is also said that a ouple of syndicates are being formed for a similar purpose. The a duty looks like a fixture, and, with the present party in power, here is always a possibility of getting an increase of duty or even bounty. Any Congress that will seriously discuss Mr. Hanna's rguments in favour of bounties to rich shipowners wouldn't mind little thing like helping two or three tea companies at the expense 76,000,000 people. Therefore, we think there are possibilities in hese tea schemes in South Carolina, and, if the worst comes to the orst, the demestic tea could always be disposed of as a curiosity.—*Merchants Review*, New York.

BRITISH DUTIES.

A week full of that trying monotony to which, unfortunately, e have lately become accustomed, has passed again, says the *ondon Commercial Record*, and if it had not been broken somewhat some speculation and curiosity regarding the probable action the Chancellor of the Exchequer with reference to the next udget, the monotony would have been intensified. As it was, he activity displayed in certain quarters in anticipation of a raised uty created some interest. The effect of last year's Budget ith its sudden imposition of duty on Tea, Coffee, Tobacco, etc., as remained fresh in everybody's memory, and all those interested articles favourable to the purpose of the Chancellor of the xchequer, have been grealy troubled, and their peace of mind has en much perturbed by the uncertainty of the decision of Sir ichael Hicks-Beach. Tea, Coffee, and Tobacco have formed a obby lately of those entrusted with the compilation of Budgets, and he anxiety felt by holders and dealers that a renewed raid on their eserves was contemplated, was very natural and pardonable. he utterances of the Chancellor in the House this week have by means removed the anxiety, and the wholesale "clearing" of ntiable articles continues unabated. This removal from Bond s attained such enormous proportions that it begins to depress arkets, inasmuch as consumers and dealers, of some of the ticles threatend, have locked up vast sums in the clearance of eir stock, and are thus prevented from profiting by cheap offers. We hear, to give only one instance, that Belfast, which is the third largest Customs Duty-paying Court in the Kingdom, has returned an increase of £242,000 for dutiable goods cleared during the first-half of February, as compared with the same period last year. Whichever articles the Chancellor of the Exchequer may select for his purpose of filling the coffers of the State, he will hardly hit upon Tea, for this commodity, in our opinion, cannot bear heavier taxation Its value, on the whole, has declined to about the extent of last year's increased duty, and a further imposition would undoubtedly restrict the total consumption to a serious degree, a fact which, at the present state of the Tea markets, would be absolutely fatal. The position of the article at the moment is such that special efforts have been deemed necessary to devise a method for the re-establishment—with as little delay as possible—of a sound and healthy basis for working Tea both here and in Ceylon. Meetings for this purpose have been held in London and Colombo, and a decision has been carried at the latter place by the Planters' Association to reduce the plucking acreage by 10 per cent., and to increase the production of green Teas. The report does not state whether Indian planters have agreed to this arrangement as well, but it is to be hoped they have, for without them it would not be complete. Not hampered by a further imposition of duty, and strengthened by a fall in supplies, Tea should have a good chance of recovering its old value.

REDUCTION OF AREA WITH INCREASE OF OUTPUT.

"Manager" writes to a Colombo contemporary :—

Your leading article of 21st inst. gives startling figures. I will not repeat them though they look simple enough, but I should think India will pause before agreeing with Ceylon to rest any part of her cultivated area.

17,717 tons manure means 53,151 acres of tea manured. The friend you support—on his style of working—would expect quite 200 lbs. per acre as the legitimate extra quantity of tea to be produced by the application of this manure that equals 10,630,200 lbs. extra tea. With the present labor supply in the country there is nothing to prevent a still larger increase in manuring operations for 1901. What is the use then of resting one portion while we go on increasing our production in this way from the remaining area. Does not above go to prove that it is not the resting of 10 per cent. of our tea that is needed (any benefit from that is doubtful) but an actual reduction in output of say 10 per cent. This could be leased on the actual crop of the last two years; thus an estate averaging 100,000 lbs. for the two years should undertake to put ony 90,000 lbs. on the market, leaving it to the proprietor to decide whether he would pluck finer, rest a portion, destroy his low grades, or sell to the natives of Jaffna, Trincomalee or India; just reduce as it best suits his own taste or individual estate.

In some such way only shall we get any reduction in output that will be of any help to us. Still we must support the best scheme that is brought forward so as to make a beginning and do our best to make it workable in such a way as shall benefit us all. I do not think your friend was unjustly criticised. We do not object to manuring, it is fair legitimate cultivation; but we do object to everything being taken that the bush will produce, and this at the lowest possible cost of plucking, so making and throwing on the market all unnecessarily increased quantity of low class teas that are spoiling our good name and ruining our industry.

In olden days we made tea so as to get the best price obtainable, the question was not—How cheap are you plucking? or—What is your yield per acre? but—What price did you get for your last break?

If men would work now on these lines, and manure so as to keep their bushes healthy, we should not hear so much about over-production; high and low estates would each in their own line get better prices than even your highly manured old coffee land has given during the last year or two.

Here are figures from a typical old coffee estate averaging over 40 years' cultivation in that product. Not a single acre of new land has been opened for tea and it is not in a favourite district Area in tea, 356 acres, carefully plucked, and manured, just sufficient to keep up the fertility of the soil.

Season ...	1895	1896	1897	1898	1899	1900
Total crop ...	184,539	182,133	173,000	169,000	175,000	185,000

TEA "REFUSE" AND CAFFEINE; ALSO CINCHONA PROSPECTS.

Mr. F. L. Seely,—the very worthy and well-informed representative of a big American drug house—has been giving us some useful information about tea refuse and caffeine Mr. Seely is chiefly interested in cinchona and quinine, and he tells us plainly that Java commands—and must for many years command—the "bark" market with her 25,000 acres of old trees, chiefly Calisaya, which, if the price justified the export, could supply five or six million lbs. in place of the normal one million lbs. of bark, each month. Last year Java supplied 12,000,000 lbs. of cinchona bark and manufactured one-tenth (one million ounces) of the world's supply of quinine. There is, therefore, no special encouragement to grow cinchona in Ceylon, save as an adjunct to other products; and in this direction, a good deal may be safely done, because the Java planters are bound to keep up the price for their own protection. Mr. Seely ran up to Kandy, Hatton and Blair Athol; but finding it took him four hours to find as many cinchona trees (!), he thought he had better hurry over to India.

But now to turn to refuse tea and caffeine, Mr. Seely estimates that the world's requirements in caffeine equal 50,000 lbs. at least and may shortly rise to 100,000 lbs. To produce this quantity, chemists require from five to ten million lbs. of refuse tea. The firm of Messrs. Bohringer, as representing the great Mannheim Chemical Manufactory, have hitherto been the chief purchasers of such refuse; but they find a difficulty in dealing with planters, because of their fear lest any of the tea should be sold for food consumption. Of course, such an idea is absurd in the case of a house of the standing of Messrs. Bohringer. But Mr. Seely suggests a very easy check. The addition of some lime to refuse tea would prevent its use for food consumption, while it would aid, even expedite, the work of the chemist. If, therefore, the planters consigned their refuse tea to Messrs. Bohringer's store in Colombo, a representative of the Planters' Association or "Thirty Committee" could, once a month or once a quarter, check the consignments and see the lime duly added. We give this suggestion for what it is worth. Certainly the transfer of some 5,000,000 lbs. of refuse or rubbishy teas to the chemist ought to be an object worthy of attention from the Association and Chambers' Committees. —*Ceylon Observer.*

CEYLON SCIENTISTS.

In the report of the Director of the Royal Botanic Gardens, Peradeniya, it is remarked :—

The Mycologist and Entomologist have carried out a great deal of work during the year, and their departments are becoming gradually organized on the lines which experience shows to be most useful. The bulk of their time is of course taken up with researches into the nature and life history of the numerous insects and fungi which are or may become of importance with regard to agriculture, but they have also travelled through many districts of the Island to investigate diseases and to give advice and assistance in dealing with their attacks. One method employed with some success has been for one of them to attend a meeting of the local Planters' Association in a given district, and there to discuss particular diseases and the modes of dealing with them, subsequently visiting selected estates to give practical instructions and to study the diseases more in detail. Such work is at present considerably handicapped by the extreme reluctance of cultivators to say or do anything that may seem to confess the presence of disease among their crops, but as time goes on the advantages of taking early advice and action will become more evident, and this source of difficulty and friction be lessened. Detailed reports of both officers are given as appendices.

The organization of a department to deal with prevention of disease is a new and a very important, though perhaps a less showy, line of work than that of the introduction of new industries. The losses caused by disease are enormous, and to save even 5 per cent. of them is a great gain. The establishment of other industries has, however, not been lost sight of. The Botanist and the recently appointed Chemist have devoted much attention during the year to camphor, which seems, owing to the action of the Government of Japan, likely to prove worth cultivation in Ceylon. They have also commenced a detailed investigation into the chemistry and bot of the citronella and tobacco industries, with a view to discover what improvements are possible that may avert the threate danger of collapse from over-production and foreign competit Further details are given below.

The office and clerical work of the department has increased v much during the year. The correspondence with planters others on diseases, modes of cultivation, etc., is rapidly increasi and takes up a very large part of the time of the scientific staff. is hoped to relieve this pressure during the next year by publication of more frequent circulars, etc., which may be dis buted instead of letters in answer to many of the most frequen recurring questions. A lithographic press has been recen obtained, and it is intended in future to illustrate the circulars proceeding which should add to their usefulness. Their circulat continues to increase, and they seem to meet with approval fr the agricultural public.

CINCHONA BARK SHIPMENTS.

According to our cable advices the total quantity of cinch bark shipped from Java to Europe during January, 1901, 500,000 kilos. as compared with 550,000 kilos. during Decemb 1900, and 307,000 kilos. during January, 1900. In the follow table we give figures showing the quantity of bark shipped dur each month since January 1, 1899:—

	1899. Kilos.	1900. Kilos.	19 Ki
January	255,000	307,000	500
February	465,000	320,000	
March	488,500	325,000	
April	498,500	265,000	
May	476,500	408,000	
June	566,450	433,000	
July	470,000	314,500	
August	601,200	488,500	
September	616,000	683,000	
October	479,000	550,000	
November	681,000	745,000	
December	313,000	550,000	
	5,910,150	5,389,000	

[Equal to 13,002,330 lbs. in 1899 and 12,856,000 lbs. in 1900.—Ed., *C.*

During the first half of last month the shipments amounted about 300,000 kilos. and in some quarters it was expected that total shipments for the whole month would again be large and a par with those during the last five months of 1900. It is t that the shipments were larger as compared with the first half 1900, but, from the fact that since November there has been a sli falling off each month, those who have been of the opinion that available supplies in Java were rushed forward to take advant of the high prices which prevailed during the last part of last y derive some encouragement. Bark shipments, as we have s many times before, are always uncertain, but the opinion is very general that shipments will show a further falling off dur February and also during March, unless there is a substan advance at the coming Amsterdam bark auction on the 2 February.—*New York Drug Reporter.*

BAD TEAS FOR AUSTRALIA.

The Secretary of the Chamber of Commerce, Colom has placed at the disposal of the Press certain corresponde on this subject. We need only quote the following extracts

From letter from Melbourne Chamber of Commerce

I may mention that an excellent Act (copy of which I am post to you) is in operation here, and is in charge of a tea expert for purpose of preventing inferior tea coming into this port. The cellency of the Act consists of the legal definition of the w "exhausted," which you will notice according to section 55 of Act, means tea deprived of its proper quality and strength virtue, by steeping, infusion, decoction, or other means. The te "other" legally meaning other similar means, consequently le lation is really passed to prohibit the importation of tea wh

es not exist, and the office of the tea expert is practically a ecure, so far as being of any benefit to the consumer.

If the word "any" had preceded "other" your Chamber would ve had no occasion to take action so far as Victoria was concern-, as the bulk of the tea complained of was sufficiently exhausted have lost nearly all qualities pertaining to tea, and if it could be imed that it contained no injurious qualities to consumers it uld be held as of no value as a beverage.

I should be pleased to know whether the samples sent to you uld be admitted into the United States of America, there being Act in force in that country under which rejections could be de easy.

From Mr. Alfred Harvey to the Melbourne Chamber of Commerce.

Dear Sir,—At your request we send you herewith a few samples low class Ceylon teas which have reached this market during e last two or three months. It is impossible to give you garden rks, because it is the custom in Colombo to ship under an *port mark* after the estate name has been scraped off.

MELBOURNE, 30*th January*, 1901.

From Messrs Copland, Mackie & Co. to the Ceylon Chamber Commerce.

Dear Sir,—At the request of our local Chamber of Commerce we nd you under separate cover samples of tea as at foot. These present lines offered or sold at auction here during the last few nths and on some of these we based our remarks in our circular ted 31st July, 1900. We do not mention the names of vendors we consider the blame lies with the grower primarily and the ippers at your end. During the past season we have found that ry largely owing to the poor quality of Ceylon teas arriving our yers have preferred and largely used Indians in their place, the neral average quality of the lower grades being much better.

We trust that for the sake of all interested in the trade you will e your influence in the direction of prohibiting the export of s of this class, every pound of which sold displaces a pound of od tea which might have been sold.

CINCHONA BARK AND QUININE.

Messrs. C. M. and C. Woodhouse say in their annual port for 1900.

The year 1900 was, like 1899, remarkable for great fluctuations the prices of bark and quinine, but the year will be especially morable as being the first for many years that the value of the it in bark did not fall below 1d per lb., nor was the price of inine under 1s per oz.

The year opened with a firm tone, prices of quinine having vanced to 1s 3d per oz. from 10d per oz. in the previous Autumn, d manufacturers being busy executing the orders placed with em for United States and elsewhere. The exports of quinine, ., from Germany during January amounted to 29,900 kilos., being largest monthly total for some years past. As advices came to nd of small shipments of bark from Java, there was a strong culative demand, and prices rapidly advanced till by middle of bruary the manufacturers had raised their quotations to 1s 6d, d sales were made up to 1s 6½ in London market. This advanced ught out sellers, and prices gave way gradually, the market ving a declining tendency till April, when business was done on spot as low as 1s 2½d per oz., though manufacturers' quotations l not fall below 1s 4½d per oz. As, however, for month after nth the exports from Java continued to be under a million lbs., out the beginning of July there was a sharp recovery, and prices vanced till the middle of September, when manufacturers' quo-ion was 1s 7d, and sales on the spot were made up to 1s 7½d per But during the last four months the shipments from Java re considerably in excess of previous years, and prices again idly declined until at the end of the year the manufacturers' otation was back at 1s 3d, and the value of quinine on the spot wn to 1s 1¼d per oz.

One of the principal features of the year has been the high prices id by manufacturers for bark at the auctions both in Holland d London. The average value of the unit for the whole year mpares with that of previous years as follows, *viz.*:—

	1900.	1899.	1898.
In Holland ...	10·13 cents	7·05 cents	4·78 cents
,, London ...	2d.	1⅛d.	$\frac{15}{16}$d.

These facts speak for themselves as to the change that has taken place in the views of manufacturers during the last two or three years.

Prices of quinine, however, though sometimes forced up too high for speculators, have on the whole been moderate compared with values of bark, and form a great contrast with what took place in 1899. In that year, when the value of the unit at the March auctions in Holland reached 10·90 cents, manufacturers raised their quotations for quinine to 1s 9d per oz.; whilst last year their quotation was never above 1s 7d per oz., though 12·25 cents was the average value of unit at the sales in September.

It will be remembered that the years 1894, 1896 were those in which prices of bark were lower than ever before or since, the average value of the unit for the three years being only 3·03 cents, and hardly any of the bark sold during this period could have paid cost of production; as, however, the market improved each succeeding year, so we find the production increasing, but not at all to the same extent as consumption did. In fact it appears certain that for the last three or four years consumption has overtaken production, and we have been drawing on our stocks of bark to make up the deficiency. This can be proved in another way, *viz.*:—

	1900. Eng. lbs.	1899. Eng. lbs.	1898. Eng. lbs.
Imports of Bark into U. K. and Holland	15,770,000	16,321,000	16,800,000
Exports ,, from ,, ...	16,243,000	15,828,000	15,160,000
Difference ...	—473,000	+493,000	+1,640,000
Estimated Bark consumed by English and Dutch manufacturers	2,000,000	2,000,000	2,000,000
Estimated reduction in stocks in London and Holland ...	2,473,000	1,507,000	360,000
	ozs.	ozs.	ozs.
Quinine, equivalent to 4½ per cent.	1,776,000	1,085,000	259,000
Deduct increase in stock of Quinine in London during the year	563,000	997,000	257,000
Estimated net reduction in stocks of Bark and Quinine together in London and Hull reduced to Quinine equivalent	1,213,000	88,000	2,000
	pkgs.	pkgs.	pkgs.
Stock of Bark in London, 31st December	9,621	16,099	19,991
Estimated weight lbs.	1,490,000	2,544,000	3,072,000

It is obvious that it would be impossible to supply another such deficiency from the London stocks of bark, as it would require nearly 1,000,000 more than the entire stock. It is uncertain what stocks may be held in Holland in *second hands* (the published stocks in Amsterdam being only *first hand* bark), but they are believed to be moderate, and the only other source to meet the deficiency is the London stock of quinine.

The average quality of the Java bark appears to be deteriorating (owing to the increased quantities of succirubra and other inferior barks being shipped when prices are high).

Public sales of quinine were held in Batavia in 1900 for the first time, and the number of them originally fixed as five was subsequently altered to eight. About 9 0,000 oz. quinine have been sold, chiefly for shipment to the United States. As exports of quinine from Germany to United States show a reduction of 1,000,000 oz. as compared with those of 1899, it is probable that America has taken Java quinine instead. The quinine factory in Java has, no doubt, had a considerable influence, as it must be to the interest of manufacturers to keep up the prices of bark and depress quinine, so as to induce planters in Java to send their bark to Europe.

In conclusion, the immediate future of the market is mainly in the hands of the Java planters. Each bi-monthly telegram of shipments is awaited with the keenest interest and promptly responded to by the market here. The high values of the unit in July, August, and September last no doubt induced planters in Java to send larger supplies of bark (though the excess was mostly of inferior

quality); but. as the effect of the extra million of lbs. shipped during the last four months of the year has been to reduce the value of the unit from 12·25 cents in September to 7·25 cents at the last sales, and with the prospect of a still further decline if shipments continue heavy, it is only reasonable to suppose that planters will not be so blind to their own interests as to continue extra harvesting, but before long we may expect the exports to become normal again, in which case prices both of bark and quinine, which at present appear to be lower than the statistical position justifies, can hardly help rising, as we have seen the present production is not sufficient for consumption. It must not, however, be forgotten that bark is *not a crop*, and at any time it is possible for a planter to uproot half or the whole of his estate, and so contribute to over-supplying the market. This would temporarily unduly depress prices; but later on, if these operations had been done on a large scale, there would be a famine in supplies, with comparatively inflated prices.

DISTRICT ASSOCIATIONS.

NORTH MYSORE.

Annual General Meeting held at the Balehonur Club, 28th February, 1901. Present :—Messrs. O. Scot Skirving, *President ;* H. Edgington, C. H. Browne, H. G. Bonner, L. Thompson, A. Buchnan, A. Foster, H. Pilkington, C. P. Reed, C. Danvers, and F. J. Parton, *Honorary Secretary.*

The accounts for the year having been audited were passed.
The Honorary Secretary then read the General Report.

Annual Report, 1900.

Gentlemen,—On behalf of your Committee I have much pleasure in laying before you the Annual Report for the year now ending.

Accounts.—The income derived from subscriptions amounted to Rs. 1,161-10-3, the expenditure to Rs. 786-0-6 and there is now a total credit balance of Rs. 3,123-3-7.

Crops this year have been good, and the sample generally an improvement on the last few years; but the market reports are very gloomy, and I fear we must make up our minds to expect the very lowest prices for our coffee that we have as yet obtained.

Roads and Communications.—Your Committee regret that, during the current year, the condition of the main Mulnaad roads shows a considerable decline. The state of the Tarikeri, Hoppa, Hariarpur and Umblihulla road, with the exception of a few miles on either side of Gedahalli, is deplorable, it being full of holes and ruts, and the same remarks apply to the Sullebile, Balehonur and Aldur road, which I understand is in a worse condition than it has ever been for the last twenty years. The matter is a most serious one, for if our main roads are more or less impassable during the monsoon, it makes a considerable difference to the supply of grain. This year the prices were almost at famine rates, and the bad condition of the roads was to some extent the cause of the abnormal rates, and it is to be hoped that the Durbar will not sacrifice the good condition of the Government roads, in order to complete the big schemes at the Cauvery Falls and Mara Kanave. While on the subject of communications, my Association wishes to express its thanks to the P. W. Department of this Province and South Canara for their promptness in making the Boom Ghaut Road passable for wheeled traffic after the big landslip in August.

Agricultural Chemist.—Dr. Lehmann has paid two visits to the district during the current year, and on both occasions addressed those interested in coffee on various subjects connected with the industry. His first lecture was printed and forwarded to the members of this Association and we are all grateful to him for the trouble he has taken in giving the lectures and answering the numerous questions put to him. We hope that, in the course of a very short time, that his laboratory will be ready for analytical work.

Planters' Labour Act.—I regret to say that, since the last General Meeting, no further news of this long-desired act has come to hand, and when it will ever become law seems exceedingly problematic.

New Markets for East Indian Coffee.—A circular on this subject was sent to all the members of the Association and favourable replies received from about 9 members, representing about 35 to 40 % of the acreage of the Association. The question is on the Agenda paper to-day, and it is to be hoped that some decision will be decided to make an attempt to relieve the London Market of some of surplus East India crop, for which there is apparently now no us

Coffee-stealing.—One case of conviction for the theft of coffee been reported to the Association and a reward of Rs. 50 was paid the person responsible for bringing the thieves and receivers to just

French Tariffs on Indian Produce.—As the law now stands, enhanced duties will come into force after June next. The Impe Government has already been approached on the subject, but so no reply has been received, as to what steps are being taken protect the interest of the Indian Planters, and your Committee i opinion that the Chairman of the U. P. A. S. I. should again add the Imperial Government on the matter.

An address in a small silver cylinder was presented to H. The Maharajah on the occasion of his marriage last June by members of this Association.

The thanks of this Association are due to Mr. C. H. Godfrey representing us on the Local Board Fund.

In conclusion, your Committee beg to place its resignation in y hands and ask you to elect office-bearers for the ensuing year.

(Signed) Fred. S. Parton,
Honorary Secretary

Mr. O. S. Skirving said :—

Gentlemen,—There is only one subject with which my rema could possibly begin, *i.e.*, the death of our Queen. Yet on suc subject I feel some diffidence in saying anything. What one wo feel disposed to say has been said, and better said already in thousa of other places, and the grief which the great heart of the Empire f has already found adequate expression.

But what I will venture to say is that, in no spot throughout Mighty Empire over which Queen Victoria reigned, so long, so wis and so well, is the grief more heartfelt than in North Mysore.

Our loyalty and allegiance to his Majesty King Edward VII is n the less that we shall feel it sad and strange to frame with our "God save the *King*," and we shall revere the memory of our d Queen as that of the best sovereign of this or any age, one who r in sympathy with and for her people.

Gentlemen, I shall not go into all the subjects mentioned in report as having engaged the attention of your Committee; bu would emphasize the bad state of the roads in the Malnaad. F what I hear many are in a deplorable state from neglect and redu expenditure. I have personally experienced the state of disrepai the Koppa Tarekeri road. I trust that a representation to the Gov ment on the subject may result in something being done before monsoon renders the roads so bad that a grain famine will result cannot, I think, be the intention of Government to run the risk famine—from stoppage of grain supplies owing to bad roads—at end of the Province, that funds may be available for a water sche at the other.

The necessity for an act for the protection of wild animals i matter which this Association has for years urged on the Governm of Mysore, and the Honorary Secretary has again written to press urgency of measures being adopted without further delay if cert species of fur and feather as well as fish are to be preserved from tinction in the Province.

Gentlemen, the coffee industry appears in a desperate state w prices at present level—it is to be hoped that they have now at le touched bottom,—if not I cannot help saying that we shall alm deserve the fate that awaits us, since the scheme for the raising funds for pushing the sale of coffee in new, or only partly exploit markets has met with such half-hearted support. To those who far have been lucky enough to obtain reasonable prices for the hig grades of their coffee, I would say would it not be to your advanta Would you not be on safer ground if the London market was relie of the present glut of lower-grade coffee ?

At last annual meeting it fell to my lot to wish those of our co munity who joined "Lumsden's Horse" God-speed, and a safe retu to-day it is my pleasant duty to express our welcome to such of th as have returned from the war, having fought for the Empire t their Queen with honour to themselves and credit to the commun to which they belong.

In conclusion, Gentlemen, I thank you for the confidence reposed in me by re-electing me your President last year. It possible you may propose to do me similar honour in the cou year; so, to avoid inconvenience, I think it is only fair that I sho state now that I do not stand for re-election. I think it is undesira that one man should hold office as President for more than two ye

succession when there are others, as in this case, well fitted to fil the duties of President.

Mr. Parton asks me to state that he wishes to retire from the ecretaryship, as he has much work on hand irrespective of the ssociation. You will I know urge Mr. Parton to reconsider his cision, but I fear he also has quite made up his mind in the matter. You will I know wish Mr. Parton a hearty vote of thanks for his lendid services to the Association in the past; to me it has been deed a pleasure to work with so able and so tactful an Honorary ecretary.

Gentlemen, I now lay my resignation in your hands.

Mr. C. H. Browne proposed and Mr. Bonner seconded a hearty te of thanks to Messrs. O. Scot Skirving and F. J. Parton for their rvices as President and Honorary Secretary for the past four years, d regretted that they had expressed their determination not to offer emselves again for re-election.

The Committee was then balloted for with the following results:— Messrs. C. H. Browne, President, O. Scot Skirving, A. G. Bonner, Danvers, F. S. Parton, C. P. Reed, and H. Edgington, Honorary ecretary.

The following proposals were then submitted and carried:—

Address to H. E. The Viceroy.—That the S. M. P. A. be thanked r the trouble that has been taken in presenting the address, and at this Association do pay half share of the expenses incurred.

Queen Victoria Memorial Fund.—That the Deputy Commissioner be ked if he could not take steps to collect subscriptions for a local emorial, the feeling of the meeting being strongly in favour of a local emorial, even more than towards an Imperial one.

Closer Union of the S. & N. Mysore Planters' Associations.—That this ssociation cordially approves of the proposal, and suggests that e executive of the two Associations should meet at Chickmaglur or after the 22nd instant to discuss matters further.

Coffee-stealing in South Canara.—That the Honorary Secretary ank Mr. Sullivan for his letter, and the interest he has taken on our ehalf, and that a copy of his letter be sent to the various curing firms, express their opinion on the contents.

That the Collector of S. Canara be requested to establish Police- ations at Charmadi and Someshwara, to facilitate the supervision of ne imports of coffee into S. Canara and to check the number of bags assing through the said stations on their way to the Coast.

New Markets for Coffee.—Resolved that this Association support r. Shaw's scheme and that a sub-Committee, consisting of Messrs. rowne, Pilkington, Parton, and Edgington, be appointed to consider rther proposals for increasing the sale of East Indian coffee.

After the usual vote of thanks to the chair, the meeting broke up.

(Signed) FRED. S. PARTON,
Honorary Secretary.

INDIAN TEA ASSOCIATION.

ANNUAL GENERAL MEETING.

Mr. H. C. Begg, of Messrs. Begg, Dunlop & Co., presided t the annual general meeting of the Indian Tea Association, hich was held at 3 P.M. on Friday, the 1st instant, and was ell attended.

THE CHAIRMAN.

The Chairman, in presenting the report for the period from 1st larch to 31st December, 1900, said:—

I have now to submit to you the Committee's report for the year 900, and in accordance with custom, to make a few remarks upon me of the chief matters with which it deals. I had at one time oped that I might be able to congratulate you on the absence uring the past year of any of those disturbing factors, one of hich had caused so much anxiety in the previour year. But nfortunately the tea-industry is at the present moment face to ce with a problem more far-reaching in its character, and more ifficult in its solution than was that relating to the one pound raft allowance. Greatly to my regret the troubles which I pre- icted at our last annual meeting are already upon us. You will emember that I then said that "I cannot fail to have certain mis- ivings as to the prospects for the future, if energetic and succes- l measures are not taken to find new outlets for British-grown as. It seems to me that the day cannot be far distant when we all have to consider the advisability of reducing the production of our gardens, and to devote our attention rather to the improvement of our teas than to the extending of our cultivation. In order that that day may be postponed as long as possible, we must do our utmost to extend the sale of Indian teas in markets other than the United Kingdom." As you all know, the question of diminishing our production is now being very seriously put forward as one of the methods by which present difficulties may be overcome. It is perhaps scarcely needful for me to re-state to you what those difficulties are; for everyone here must be well acquainted with the fact that the supply of British-grown tea to the markets of the world last year exceeded the demand by many millions of pounds. An unprecedentedly low range of prices has been the inevitable consequence of the operation of the law of supply and demand in such circumstances; and the task before us is to devise ways and means by which the value of tea may once more be placed on a remunerative level. We are all agreed that is what we have to do; but I am not so sure that we are all agreed as to the best way of doing it. Shall we try to make prices rise by decreasing the supply or shall we try to do it by increasing the demand—that is the question before us: and for my part I have come to the conclusion that we ought to do something in both directions. But I think, and the General Committee think with me, that our greatest efforts should be given to the work of increasing the demand; because I doubt the possibility of any scheme to restrict production being a lasting one. It must be more or less of a temporary expedient; for to keep the combination together for a long term of years, will be most difficult, especially if prices rise, as the temptation to growers to break away will then become great I know that the task of increasing the demand, or if you like, of opening new markets, is one which requires time, and, what is more, which requires money. To obtain sufficient of the latter has always been our supreme difficulty; and we cannot but be envious of the comprehensive measures which the Ceylon planters were enabled to take nearly ten years ago to place themselves in possession of funds sufficient to do real and solid work year by year in the way of opening and developing foreign markets for their teas. The annual appeals, which we have made for voluntary subscriptions on a much lower scale than Ceylon, have not been responded to by the industry with that liberality which we were entitled to expect. And in the present year, when the need was never so great, we have regretfully to acknowledge that the funds contributed or even more scanty than before. A compilation we have recently issued of subscriptions to the American and Foreign Market Fund for season 1900-1901, goes to show that out of a total area of 514,785 acres of tea under cultivation in India, only some 250,000 acres, less than half, have contributed to the fund. Is it right or fair, gentlemen, that the burden should fall on so few, when it cannot be denied that any advantage derived from the opening out of new markets for the every-increasing output of our gardens is shared by all? I think not, and I venture to think you will uphold the view, which your Committee have consistently held, that a tea cess, similar to that in force in Ceylon, should be levied in India. We have recently made the suggestion to the Local Government; and we are now taking the opinion of the industry upon it. I can conceive of no reason why the Government should not help us, or rather, help us to help ourselves. When foreign Governments give to sugar producers a bounty out of the revenues of the State, there can surely be no valid objection to the Government of India collecting for us tea-producers a fund out of our own revenues. Any objection to such a proposal must, as it seems to me, be either sentimental or selfish; and I do not think the present position of the industry justifies our encouraging objections of either description. It is too early yet for me to say what the result of our appeal to the industry will be, but it is most gratifying to note that already the planters of Southern India have voted almost to a man for the cess. And if we on this side can for once exhibit sufficient magnanimity to forget our personal jealousies and to sink our petty difference for the sake of the common good, I think we shall yet see the case an accomplished fact.

You will understand then that your Committee see little or no hope of the demand for our teas being appreciably increased unless the cess is levied. Without it we can make but little headway in America; we can do practically nothing in Europe; and in Central Asia, and in India itself our efforts can only be on a tentative and experimental scale. Even the manufacture of green teas, which we are anxious to encourage, depends to a large extent upon the cess; for with our present limited funds, we can only offer a bounty upon a small quantity. In fact at our present rate of progress it will be

some years before the sale of Indian green teas can help the market for black teas, while in Ceylon they can annually offer a bounty on as much as two million pounds; and they have reasonable grounds for hoping that the manufacture of green teas will ere long afford some sensible measure of relief to the existing depression.

But, it will be complained, all these proposals for increasing consumption will take time to work out, while immediate relief is what is wanted. We have seen a multitude of suggestions recently put forward to achieve that end; and we learned the other day that Ceylon had decided to rest ten per cent of their acreage. Your Committee, a short time since, endeavoured to ascertain the views of Indian growers upon this proposal and upon other alternative proposals, such as finer plucking, a shorter manufacturning season, and so forth. The replies do not point very strongly to any one of the schemes being generally approved. But we have since seen the recommendations of the Joint Indian and Ceylon Committee in London; and they seem to be based upon the foundation that, if every grower is willing to reduce his outturn by a certain percentage, proportionate to the price of his teas, he may decide for himself, within certain limits, upon the method by which the reduction may be made. That seems a business-like idea, more especially when we take into account the diverse conditions of the different Indian-producing districts. But like every other scheme it will necessitate united action; and its success will depend, be it remembered, not upon your Committee, nor even this Association, but upon the loyalty and good sense of proprietors generally. For myself I heartily hope it will be successful, and that, as a result, we shall witness an upward movement in prices before very long.

I think I have said enough to show you how, in my opinion, we should face the present position. To put it briefly, my idea is for immediate relief, restriction of output, and for a permanent improvement in prices, more strenuous efforts—to be rendered possible by means of the tea cess to develop the markets of America, of Europe, of Central Asia, of Persia, of India itself, and of every other country where there is any likelihood of tea being sold in reasonably large quantities.

There are several other matters of importance referred to in the report, to which your Committee have given attention during the year. The two of greatest consequences are, I think, the British import duty, and the Assam Labour Bill. I need say but little respecting either, for the action decided upon at the public meeting, which was held last week concerning them, must still be fresh in your minds. I can add nothing to the forcible protests then made; but we are all, I am sure, especially glad to see that His Excellency the Viceroy has telegraphed to the Secretary of State asking His Majesty's Government to consider our protest regarding the duty.

We have just received information that the duty on tea is not likely to be increased. Let us hope that it is true, though I don't know that the information is correct. We had information the other day that some 20 million pounds of tea had been cleared from the customs to avoid the duty that was probably to be levied, on the Budget being placed before the House, and therefore I think some explanation is required, as there seems to have been some misunderstanding somewhere.

We can only hope that this action of His Excellency will have the effect of preventing any further enhancement, and we trust that our protests against the proposed increase in the rates of labourers' wages will receive equally favourable consideration from the head of the State.

Then there is the question of the scientific officer. At our last annual meeting, you will remember it was my pleasant duty to welcome Mr. Mann, who had arrived from England a few days previously. During the ten months he has been in India, Mr. Mann's energy and activity have been great. He has toured twice through Assam, besides making a preliminary tour in Cachar, Sylhet, Chittagong, the Dooars, the Terai, and Darjeeling, and publishing several valuable contributions to our knowledge of the insect enemies of tea. In Darjeeling he was accompanied by Dr. Watt, who was making investigations prior to the re-publication of his book on the pests and blights of the tea-plant. Mr. Mann returned to Calcutta from the Brahmaputra Valley in January, with the intention of devoting some time to a series of soil analyses. When these scientific operations are completed, I have no doubt we shall be placed in possession of further valuable information as regards an important branch of tea-cultivation, in which our knowledge hitherto cannot be said to have been extensive.

At the annual meeting of the Bengal Chamber of Commerce Tuesday last, at which I have no doubt many of you were prese the President concluded his address by referring in eulogis terms to the manner in which the Secretary, Assistant Secreta and general staff of the Chamber had carried out the arduo duties imposed upon them during the year. I should like to st here that the duties which the work of this Association have imp ed upon the same staff, and more particularly upon the Assista Secretary who had the control of the details of our business, we of an equally arduous nature, and they have been performed to t entire satisfaction of your Committee.

At the conclusion of his address, the Chairman invited the me bers present to express their views.

MR. R. R. TOYNBEE.

Mr. R. R. Toynbee said: Before coming to this meeting I w asked by the managing proprietor to request your support to th proposed export cess. Your Chairman has gone into the questi very fully, and I don't think I have very much more to add to wh he has said, except to point out that in no business in the world success achieved without advertisement, and advertisement mea money; but we have not got it.

MR. MANN.

Mr. Mann said: I hardly expected at such an early stage of t meeting to have had anything to say, but I was asked by Mr. Be yesterday to say something about the tours I have usually to mak in the tea districts and the observations I have made during tho tours. Well, I returned on the 22nd January after a very lon tour in the Brahmaputra Valley. I think I have visited almo every district, if not every district, in Assam, and there is nothi which struck me more during the whole of that tour than t fact that during the past five years there has been great addition extensions of tea area without any effort being made to keep u the production of the area already obtained. In fact from o or two gardens I have figures which seem to show that, althou the area has been doubled, the production of tea was precise the same as it originally was. In one garden in Newgong t area was exactly doubled, and the production of tea was exact the same as before the additional area was taken up. Of course certain proportion of that decrease would certainly be due final plucking, but one cannot think that the whole of th decrease in production per acre could by any means be explain by any method of final plucking. Therefore it seems to me th what we need at present is to concentrate our attention on the ar which is already under tea. To say the least, it would be recognise as bad agriculture to go on extending the area year by year wit out attempting to keep up the production of the area which already obtained. At the present moment it does not seem to the idea of your Committee of the tea industry to increase t production at all. We should devote our attention to improvi the quality, or rather to keeping up the quality, of the tea alread obtained. There seems to me no doubt that during the past te years the full quality of the tea of a very large number of garde has deteriorated, and this is more especially the case in those di tricts which have a larger area, as, for instance, Debroo, Doo Dooma, and Sibsagar. There are a very large number of garde where, in spite of free final plucking, the quality has undoubted deteriorated, and I am at present devoting more attention to th point than to any other. I am trying to find out what circumstanc are present in those gardens which are famed,—which have bee famed in the past for the high quality of their tea. This improvi the quality or keeping up the quality may be dealt with in two three ways. One way is final plucking. Here I should like to mak a difference which has been made in the past between fine pluckin and coarse plucking. Fine plucking will not, I think, improve th quality of the tea to any great extent. On the other hand, coar plucking, as practised in Doom Dooma, will improve the qualit but at the same time it will improve the quality, at the expense the tea bush. Therefore one will have to balance the advantage t be gained by enhancing quality with the injury done to the te bush. Another way to deal with the subject is to ascertain wh manure is likely to improve the quality of the tea. In connectio with other industries and in other countries, this has been carrie out with great success, especially in America and Germany, and in th way quality has been improved to a very appreciable extent. I thin by this means we may improve the quality of the tea. At any rat at the present time I am working very closely on this line, and co

ring not so much the question of increasing the quantity of tea luced per bush per acre, but rather the improving of the quality ie tea from the same garden. With regard to the other question, o the best appliances in the manufacture of tea, I hope to deal that later on, but improving the quality by fine plucking, by hods of pruning and methods of manuring, seem to be the most ortant question at present.

HON'BLE MR. BUCKINGHAM.

he Hon'ble Mr. Buckingham said that he was very glad to hear other day that they intended to hold this meeting earlier this than they did last year, and it was a great pleasure to him to present. He had no doubt that they would expect him to say a words about the amendment of Act I, but time would hardly w of his going through the Act from beginning to end. They e aware that the chief amendment to the Act was aimed at ping abuses in the recruiting districts, and he hoped this ect would be attained. As far as the labour districts were con- ned, certain amendments were made which would affect them ally with the coolies, though it perhaps gave the latter the antage. He thought the Association owed a great deal to untiring zeal and energy displayed by the. Hon. Mr. eigh, and also to the member in charge of the Bill, the n. Sir C. Rivaz. They had more than 15 sittings. There was one nt which he desired to mention, and that was with regard to ing an Assistant Superintendent of Emigration. He thought y would all agree with him that they should get a good man, one getting anything like Rs.100 a month. He saw that in har it was proposed that there should be subscriptions of one ee towards the pay of the Assistant Superintendent of Emigra- . He thought this was a matter which this Association should e up. It was not very much, but it would enable them to have very best man available. He did not think they would have y much difficulty in getting the Government to agree to their inating some one to be approved by the Government of Bengal. agreement with the coolie should, in the first place, be a written and in the second place, there should be a substantial advance, in the next place, the period of limitation should be in plain ds three or four years. He thought this was only fair and est in dealing with the coolie. The last year he was down they sidered the cost of sending specie to Assam which was nearly ble what it cost up the Irrawady to Mandalay though the ance was shorter. He referred this matter to their Committee, referred it to Messrs. Kilburn & Co., who very willingly re- ed the cost. Since then he had seen the steamer companies decided to reduce it lower by cargo steamers. It was originally annas, but it was now reduced to $9\frac{1}{4}$ annas per cent. This was very much, but still in the long run it would come to a good l. In dealing with the question of reducing the output of tea, did not see how this could possibly be done. Some gardens ght have had a bad season last year, and hope for a good season year to make it up. In the same way gardens that had an eptionally good season last year might not be as fortunate this son. It seemed to him, therefore, unfair that 10 per cent. of the put should be cut. They talked about reducing their output and y could not get rid of their surplus tea. A great deal had been tten and said about getting the natives of India to use their tea. idea was that gardens should send their lower grades of tea, and t a Committee should be formed here with a Secretary, whether ointed here or got out from England did not very much matter. is Committee should be supported systematically. A company uld be made. He did not see any difficulty in getting the essary funds. He thought the gardens should send tea to the mmittee who should be careful to realise only very small sums. y should certainly want some money to start with, and after- ds send down tea straight to the Secretary. They should lise sufficient sums to keep the concern going. There was a posal that they should ask Government to help them by allowing post offices to sell the tea, but he thought it was more than y could expect. It was utterly impossible to do it, but a great l could, he thought, be done through what were called extra partmental post offices. There were at present 13,431 post ces in India, and there were 7,672 extra departmental post ces, which might help them a good deal, as they were kept ng by people who were allowed to sell things. He only put forward as they might at some near date be able to take the tter in hand. He desired to say, in conculsion, that the Assam sociation owed a great deal to the Chairman and Secretary of this Association in Culcutta, and he wished to record his thanks to this Association.

SIR PATRICK PLAYFAIR.

Sir Patrick Playfair said: He did not feel certain in his mind that to attempt to reduce production by resting 10 per cent. of the area in full bearing would have either practical results or be a measure of economy. In the first place, the less profitable areas would be those to be temporarily abandoned by growers; efforts would at the same time be made to improve production from the cultivated area to reduce the cost of the crop. And the measures that will be adopted to raise the quality of the crop would further tend to maintain quantity. By concentrating labour on the reduced area this can be probably brought about. As an illustration he called their attention to the report of the labour immigration for 1899 where the Deputy Commissioner of Darrang reports "that although some of the more favourably situated gardens are well stocked with labour, in others leaf had to be left on the bushes last year for want of hands to pluck it." They would recollect that the measures taken to curtail production of gunny bags by stopping factories one or two days in the week did not really arrest output for manufacturers having the inclination and the time to repair and replenish their machinery, and so make good the days the mills were silent, the operatives being equally interested through income in production. It might also be feared that under this system a forced supply of fine grade teas may cause the market to be overstocked, and might affect consumption among the masses. His feelings coincided with the views expressed by a writer in *The Financial Times* at the end of January, who said: "What is wanted is for growers to produce better qualities. Let Cachar, Sylhet, Dooars, and Ceylon go back to produce their former standard of teas and the position will be soon alleviated." He reminded them that when the dark clouds of 1882-84 hung over the tea industry to the apparent ruin of a great many growers did not enter into a combination to curtail crops, but they sought the developement of new markets and made efforts to raise the standard of the quality of the crop. Distributors, such as Lipton, Mazawatee, Cleary, and others, arose and not only by their own efforts promoted consumption, but also imparted greater activity into the old distributor or middleman. He recollected Mr. Goschen once observed that there was no use of having tons of raisins at the docks and old ladies in the Provinces willing to make plumpudding unless there were an organised system for distributing the raisins. It seemed to him that this illustration fits the case in India, and that they probably have a large market at their doors were it properly exploited. He believed it would be less wasteful and probably more profitable to distribute a percentage of the crop in India practically free of cost rather than wantonly destroy it, as a speaker suggested at the London meeting, or leave it on the bushes. If two syndicates could be formed, the one to distribute the produce of the Province of Assam throughout Bengal, Orissa, Central Provinces, the North-West Provinces, and the Punjab, while another syndicate arranged to distribute the produce of Ceylon and Travancore throughout Madras. Bombay, and Baluchistan, he thought it would be a good division of labour. If special rates of inland steamer and railway freights, and of warehouse charges in Calcutta, could be obtained for this tea, and if a cheap envelope were found in a close woven gunny bag, a well-worked system might deliver supplies to the markets throughout the country by the medium of the Bazaar. *moodi*. It would be a great undertaking, and he believed it could be accomplished if a Committee of nine earnest men were to give it their close and constant attention. If growers contributed the tea free of cost, it would perhaps be possible to obtain from the *moodi* a price to cover administration expenses, but he did not think any more. Were the tea to be distributed without charge, it might be looked upon with suspicion. A necessary precedent to this scheme would be to ascertain whether the people would be likely to drink tea, for it must be remembered that only a few people in and about the Presidency towns have ever tasted tea, and understood how it is to be prepared. The very preparation will cost the consumer something in fuel and utensils, and that alone may be a consideration to the poorest people which class they wish to serve. Were growers to agree to give 3 per cent. of the coming crop for free distribution it would help the industry, and such donation would not be likely to encourage coarse plucking, because growers have seen that quality must be the very first consideration and on this account a finer system of plucking will be generally adopted. Contributions for working capital would be required in addition to

the funds at the disposal of this Association. The crop of 1900 was undoubtedly bad in quality, perhaps from climatic influences as well as from free croppings. He would have liked to have heard Mr. Mann's views on this subject. He would hope that the favorable cold weather that has been experienced in many districts, if followed by seasonable rains, will produce a quality of leaf of superior merit this year. He often found this to be the case, and he looked forward to 1901 being what might be termed a better "vintage year," the sap having been well driven down and the soil have been sweetened by drying.

He was afraid he was one of those who do not consider it a sound policy to invite Government to impose taxation. Most people are averse to taxation, and to quote Burke's famous saying: "It is as difficult to tax and to please as it is to love and be wise." Differences of opinion would no doubt arise as to the method and field for distribution. They might wish ineffectually to have the tax removed and might find taxation suggested by the executive for other purposes. If it be in the interests of many to combine and join in a scheme for advertising or distributing their wares, as a previous speaker said it was, it will no doubt be carried out voluntarily without holding the abstention or want of support of a small minority, sinking their jealousies as the Chairman said they should, and if they benefited themselves, others may eventually join them.

MR. TOPPING.

Mr. Topping said: Mr. Chairman and Gentlemen,—I would like to make a few remarks in regard to the curtailment of output question. It is quite evident that something must be done whether by the elements themselves or by ourselves, that is the question to reduce the output this season. If we could rely upon the elements doing the needful in the matter, there would, of course, be no further need for us to discuss the question, but as we cannot do that we have to face the position as it now presents itself to us and try to devise some means of putting our house in order, or rather I should say of combatting the resultant evils of an over-stocked market of inferior, but at the same time very cheap tea – cheap I mean to the consumer, but a dead loss to the producer. I know, Sir, that several schemes must have been put before you within the the last few weeks, some of which at least if put into practice and carried out loyally right throughout the season would have the desired effect of relieving the market at home considerably this year, and although at this meeting it may not be possible to discuss any of the schemes that have been suggested, still I would venture to suggest that the scheme put forward by the Surma Valley sub-Committee, of which I have the honour to be Chairman, might be mentioned at this meeting. I don't mean you to infer, Sir, from my expressed desire that the views of the Surma Valley sub-Committee should be ventilated at this meeting, that the members of that Committee imagine themselves to be superior in intellect to their neighbours; but what I will say is that some outside the Committee having read our proposed scheme consider it to be one of the most practical put forward, and on that account, Sir, I would like all the members of this Association assembled here to know about it, and I would suggest that, in order to gauge the feelings of members in regard to the carrying out of any such scheme, a show of hands be taken for and against the adoption of the proposed scheme. Seeing that the next mail from London will bring us the result of the deliberations of the Association there as to the scheme which should be carried out, we cannot of course bind ourselves to any particular scheme now, still I do not think any harm can be done by our doing what I have suggested in regard to the Surma Valley sub-Committee's proposed scheme. Before I sit down, Sir, there is one other remark I would like to make in connection with this matter. I know it is the opinion of some that it is unreasonable to expect producers, who have been getting paying prices for their teas this last year, to agree to do anything to curtail their output this season, which means of course that if this is to be the policy for the conduct of our affairs at this critical stage of the industry, the weakest will go to the wall. This is no doubt a sound enough argument for such fortunate producers to put forward, but, Sir, I would respectfully beg to point out to such gentlemen that, in my humble opinion, it will be to their advantage, I think, to support their weaker brethren at this time, otherwise the places of the weak are almost certain to be taken by others who may in the end outdo the strength of those who are strong at present. We have worked in a body against the proposed increase of coolie wages and against any enhancement of duty, which combined effort is for our common benefit, so I think while the industry is on the verge of a serious crisis, it behoves everyone connected with the indust do his little all to save it from a crash that will bring serious l not ruin, to hundreds of our fellow-countrymen.

Mr. Ashton said that Sir Patrick Playfair had opposed the pr ed tax on tea. He understood Sir Patrick Playfair's reasons were it was an unusual kind of tax, which was perfectly true, and t the tax were imposed the Government might divert the rev afterwards to its own purposes. He did not see how Govern having raised the tax at the request of the trade, and having a to hand over the tax to the Executive Committee, could afterw take it for the general revenues of the country. They had for been trying to get an increase of the voluntary contribution, an proposition was brought forward as an alternative, as it was in sible to get the Government to levy this tax unless they were tically unanimous; he thought he was justified in asking Sir Pa Playfair to see if he could not withdraw his opposition.

The Chairman, before putting the motion to the meeting, said Mr. Buckingham had placed at their disposal a number of pa which contained very valuable information to which he dire their attention.

The motion was then put and carried unanimously. The C man moved, and Mr. R. H. A. Gresson seconded, the first resolu which ran as follows:—"That the proceedings of the General C mittee during the past year be confirmed, the report adopted the accounts, as audited, be passed as correct." It was ca unanimously.

The Chairman moved, and Mr. Norman McLeod seconded next resolution:—"That the rate of subscription for the cur year from each garden belonging to the Association be fixed at anna per acre under tea cultivation." Carried unanimously.

The Chairman moved, and Mr. R. Magor seconded, that following firms be requested to nominate a representative to s on the Darjeeling and Dooars sub-Committee during the cur year:—Messrs. W. S. Cresswell & Co., Davenport & Co., Du Brothers & Co., Finlay, Muir & Co., Jardine Skinner & Co Mackillican & Co., McLood & Co., and Octavius Steel & Co.

The motion was carried unanimously.

Mr. H. S. Ashton moved and Mr. R. R. Toynbee seconde "That the thanks of the Assam Association be conveyed to members of the Cachar and Sylhet Branches, and to the mem and Honorary Secretaries of Local District Committees, for t co-operation in promoting the objects of the Association, w was also carried unanimously."

The Chairman reported the result of the election for the Ge Committee of the Association for the year 1901, held under 5 of the Rules of the Association, as follows: Messrs. Begg Dunl Co., Williamson Magor & Co, Jardine Skinner & Co., Octa Steel & Co., Duncan Brothers, Shaw Wallace & Co., Bal Lawrie & Co., Finlay Muir & Co., and Kilburn & Co.

MR. TOPPING'S SCHEME.

The following is Mr. Topping's scheme for the curtailmen output:—

"That the average outturn of gardens for the last two years, 1899-1900, less 10 per cent. from the basis of this season's crop, is to say, the quantity of tea to be made by any one garden, the exception hereafter mentioned, must not exceed the ave outturn for 1899.

"The gardens have the choice of curtailing their output by ducing their crop figures or abandoning an area sufficien ensure the necessary reduction in the outturn.

"The above to apply to full-bearing gardens, and as regards native gardens the Committee would propose that 10 per cent deducted from the estimated crop figures for this season.

Some exception, the Committee consider, must in all fairnes made in the case of gardens whose teas have been realising prices, and they would propose that a reduction of outturn in cases be made on a sliding scale as follows:—

"10 per cent. in respect of gardens whose teas have fetched du the year 1900, an average of 7d per lb. and under in London or equivalent of that price here.

"8 per cent. ditto ditto. An average from 7d to 9d in Lon or the equivalent here.

"5 per cent. ditto ditto. An average from 9d to 11d in Londo the equivalent here.

"And that gardens whose teas have fetched 11d per lb. in Lon or its equivalent here should be exempted."

SHEVAROY.

Proceedings of the Quarterly General Meeting of the evaroy Planters' Association held in the Victoria Rooms, 1 P.M., on Monday, the 4th March, 1901. PRESENT :—essrs. Windle, C. Rahm, W. Rahm, E. Dickins, W. J. chler, J. C. Large, S. M. Hight, C. G. Lechler, R. A. lby, H. Dickins, and R. Gompertz, *Honorary Secretary*.

. Read and passed accounts up to the 28th February, 1901, owing a balance in hand, on that date, of Rs. 523-7-2.

2. Read correspondence with the Collector of Salem regarding ule-breeding.

Resolved that Honorary Secretary be requested to inform the llector that several of the planters are willing to keep country ny mares if Government will supply the Association with a good ck stallion and consent to purchase the foals produced when they e six months old at Rs. 50 each for a term of three or four years.

3. Read letter from E. C. Duff & Co. stating that the coffee sent wn from the Shevaroys for Lumsden's Horse had not yet been sold d would only fetch Rs. 5 or 6 per bushel.

Resolved that the coffee be sold for what it will fetch and the proeds returned to the Honorary Secretary, S. P. A.

4. Read letter from Mr. C. G. Lechler complaining that letters nt to the cutcherry were invariably returned when the Tahsildar as on circuit.

Resolved that, owing to the continual refusal at the cutcherry of tters addressed to the Deputy Tahsildar, while absent on circuit, e District Magistrate be requested kindly to have a locked letter-box fixed to some prominent part of the cutcherry for deposit of such tters, as it would be a great convenience to planters sending mmunications from a distance.

5. Read letter from the Collector saying that H. E. the Governor ould prefer a deputation of the planters to wait on him to receiving formal address.

Resolved that the following gentlemen compose the said deputaon : Messrs. W. J. Lechler, J. C. Large, F. Short, and R. Gompertz.

The following papers were read and recorded :—

10/01. Circular from Secretary, U. P. A. S. I., Madras. Forwarding opy of letter from the Chairman *re* the "*Indian Tea Cess.*"

11/01. Circular from Secretary, U. P. A. S. I., Madras. Chairman ks Government for expert advice *re* whether harbours can be kept pen in south-west monsoon and solicits support of Bombay, Madras, d West Coast Chambers of Commerce.

12/01. Circular from Secretary, U. P. A. S. I., Madras. Forwarding opy of S. P. A.'s resolution about compulsory coffee cess. Other ssociations have not expressed their opinions about it.

13/01. Circular from Secretary, U. P. A. S. I., Madras. Planting ember and Central Travancore Planters' Association resolve to pport Wynaad in endeavouring to remove duty on Tea in Ceylon—eylon Planters also wish it removed.

14/01. Circular from the Secretary, U. P. A. S. I., Madras. Central ravancore is in favour (almost unanimously) of a compulsory cess.

15/01. Circular from Secretary, U. P. A. S. I., Madras. Forwarding inions of various Associations about Mr. Shaw's proposal *re* r. Langdale's proposed tea and coffee shop in Paris.

16/01. Circular from Secretary, U. P. A. S. I., Madras. Forwarding plies from gentlemen invited to serve on Committee for taking eps to put down adulteration of coffee.

The following papers were laid on the table :—

Planting Opinion, dated February 9th, 16th, 23rd, and March d, 1901.

Brazilian Review, dated December 25th and January 1st, 8th, and th, 1901.

Proceedings of the Wynaad Planters' Association, dated 6th Febary, 1901.

Proceedings of the Indian Tea Association, dated January 22nd d 30th and February 16th, 12th, and 18th, 1901.

Vol. II, Bulletin No. 43 (sugarcane in the Godavari and Ganjam istricts).

YERCAUD, *h March*, 1901.

(Signed) ROBT. GOMPERTZ,
Honorary Secretary, S. P. A.

WYNAAD.

Proceedings of a General Meeting held at Meppadi Club, on Wednesday, 6th March, 1901. PRESENT :—Messrs. Abott, Behr, deFonblanque, Hockin, Lance, Mackinlay, D. Mackenzie, Nicolls, Parry, S. H. Powell, Junior, Taylor, Trollope, and G. Romilly, *Honorary Secretary*.

Mr. M. D. Taylor in the Chair.

1. Proceedings of last meeting were taken as read.

Several members present complained that they had not received copies of the proceedings.

2. **Import duty on Tea in Ceylon.**—Read letter from the Chairman, Madras Chamber of Commerce. The Honorary Secretary was instructed to ask the Chairman of the U. P. A. S. I. to take combined action with the Madras Chamber of Commerce in the matter.

3. **Crisis in the Tea industry.**—(*a*) Read letter from the Honorary Secretary, Central Travancore P. A., suggesting (1) that the district be asked to pluck only two leaves and a bud ; (2) that the district exploit India with not less than 10% of the lower grades of tea, or as an alternative sell the same in Colombo for the Russian trade.

Resolved (1) that this Association considers it unnecessary to give advice to individual planters in this matter ; (2) that it is in favour of the suggestion to exploit India with a proportion of lower grade teas and the Honorary Secretary be instructed to address the Central Travancore Association with a view of drawing up a scheme whereby this object might be effected, especially with regard to the funds for carrying it out, and the method of distribution.

(*b*) Read circular from the Indian and Ceylon Tea Associations in London recommending a reduction of output. This Association has already recorded its opinion that the scheme is not practicable.

(*c*) Read proceedings of the Indian Tea Association, 12th February, with a return attached showing the subscriptions to the voluntary tea cess only 250,000 acres out of 514,000 being subscribers.

4. **Differential duties and the French Tariff.**—Read letter from the Honorary Secretary to the Chairman, U. P. A. S. I., asking him to again address the Government of India on the subject, as the respite from the increased taxation is only till the 30th June.

5. **Harbour on the West Coast.**—Read correspondence between the Chairman, U. P. A. S. I., and the Chief Secretary to Government, Public Works Department. Recorded.

6. **Pepper Thefts.**—Read letter from Mr. H.B. Winterbotham. Numerous cases of undetected thefts of pepper were reported. Resolved that the Honorary Secretary address the Collector of Malabar, calling his attention to the great increase in pepper robbery during recent years, and to the comparative helplessness of the Police in dealing with such cases, owing to the absence of special legislation for its protection, as in the case of coffee.

7. **Absence of the Deputy Collector.**—Attention was called to the continued absence of the Deputy Collector on duty in the low country. The Honorary Secretary was instructed to address the Collector of Malabar on the subject and ascertain if anyone was to be appointed to do his work.

8. **Coffee-shop in Paris.**—Read Circular No. 15, dated 18th February. The Honorary Secretary was instructed to point out that this circular recorded opinion expressed as long ago as November and December and that apparently neither Mysore nor Coorg, (the Association most largely interested in coffee) had expressed any opinion on the subject. This Association recorded its desire to support the scheme by donations, in January last, and at the same time asked for information as to what action these two Associations were taking in the matter.

9. **Proposed Coffee Cess.**—Read Circular No. 12. The Honorary Secretary was instructed to point out to the Secretary, U. P. A. S. I., that this Association had already declined to join in levying this cess.

10. **Adulteration of Coffee.**—Read Circular No. 16, giving the answers from gentlemen in London who had been asked to serve on the special Committee. Recorded.

11. **Poodoopady Rest-house.**—Read letter from C. Shangaren. Resolved that C. Shangaren be paid Rs. 50 towards thatching the buildings. Mr. Hockin kindly undertook to see that the work was properly done.

12. The following papers were laid on the table—

Report on cases of coffee-stealing quarter ending 31st December, 1900.

Notice of postponement of sale of occupancy right of Survey No. 692, at Sultan's Battery.

Agricultural Ledger No. 19, on dairy farming.

Do. do. ,, 20, on implements for tillage.

I. T. A. Circulars.—Trade between India and Thibet *viâ* Leh.

,, No. 12, on the work done at the Paris Exhibition.

,, No. 13, outturn of 1900 season.

,, Monthly statistics.

,, Proceedings, 12th February, 1901.

,, Notice of appointment of Mr. de Niceville as State Entomologist.

,, Alleged adulteration of Indian and Ceylon Teas.

Proceedings of Shevaroy Planters' Association.

A vote of thanks to the Chairman terminated the proceedings.

(Signed) M. D. TAYLOR,
Chairman.
(,,) GEORGE ROMILLY,
Honorary Secretary.

IF SMITH HAD EXPLAINED.

My wife says, and she says it with a snap, that never, *never* again will the Smiths get an invitation to eat at our house. And when she once makes up her mind to anything, she sticks to it like shoemaker's wax to a bit of woollen cloth.

You see the Smith's, man and wife, were old and intimate friends of ours. We lived within a stone's throw of each other for many years, and were as thick as treacle. As to our worldly estate. we were about on a level, in very moderate circumstances.

Between two and three years ago Smith's employers sent him to America on some business errand; he would not tell us what. A fortnight since he turned up at home and gave out that he had made a trifle of money for himself while he was away.

Last Tuesday we had them to dinner; the best dinner my wife could get up. And it was a good one, if I do say it myself. Yet, socially, it was a failure. In the old times Smith had the appetite of a cab-horse. Now he picked and winced over the very dishes that used to be his favourites. As my wife pressed him to taste this or that, he thanked her politely, but he didn't eat. Mrs. Smith apologised for her husband, and said he had been ailing somewhat since his return from America. So the dinner ended in disappointment, and the Smiths went home early.

"Poor Smith is ill," said I. "No" said my wife, "he isn't ill. He's proud. He thinks his old friends aren't good enough for him; that's where it is. He's rich, and we are poor, and——" The worried woman here broke down and cried, and I went out for a consolation smoke.

And yet bless your soul!—wait a moment, however. If Smith had been perfectly frank and said, "I am not the man I was. I lived high in America, and I'm all gone to pieces with inflammatory dyspepsia, and this splendid dinner will half kill me if I eat it." If he had said that we should have pulled through without a break. Why didn't he say it?

Here is a lady who does not hesitate to tell us her experience with that wretched ailment. Miss M. J. Barton is her name, and her home, 56, Sorby Street, Sheffield. In a written statement, dated September 19th, 1900. of which the following is the sum and substance, she says that it is now rather more than two years since her health began to fail. At first, she thought it was only some trivial ailment that would soon pass away, for beyond loss of appetite and a feeling of languor and weariness, there did not seem to be much the matter with her.

So she struggled on with her work as do countless thousands of brave women every day, hoping to be right again in a short time.

But alas! her hope was short lived, for indigestion, that demon health-destroyer, had got her in its iron grasp and would not set her free. Instead of getting better, she became worse.

Her tongue was now always foul and nasty, and after taking food —no matter how little—she experienced such a sense of fulness and tightness in the chest that she could scarcely breathe. "It seemed, she says, "as if some heavy weight was resting on my chest and pressing in my ribs." Indeed her chest became so sore and painful that she could scarcely bear anything to touch it, and was al afraid to walk about, the slightest jolting hurt her so.

This feeling of weight and oppression in the chest is one o most distressing and common symptoms of Indigestion. Lik red flag of the railway signalman it counsels caution and war danger ahead. What untold pain and misery might be avoid only we heeded these danger signals of nature, but there, wi the good of moralising. We *don't* take warning, therefore s in consequence. Miss Barton did for she goes on to say:—

"At times, I suffered intensely from wind spasms, and was stantly vomiting sour water. Sleep no longer refreshed me, f only came in snatches and was disturbed by horrible dreams. prived of proper rest at nights, and afraid to eat much becau the fearful pains that were sure to follow, small wonder I go weak and thin, that at last I was forced to give in and take to bed, where I stayed for six weeks. During that time I vomit quantity of blood.

"The doctor said I was suffering from Indigestion and an u ated stomach. His medicine enabled me to get down stairs a but did not cure me, for I still suffered great pain after eating, was always tired and weary.

"In this condition I remained for several months, despairin ever being well again, but providentially I was led to try Sei Syrup, and to that medicine alone is due my present good he Now I can eat heartily and enjoy my meals without fear of p and feel brighter and better in every way than I have done for two years."

Why Mr. Smith didn't mention his illness at our dinner, I d know. He admitted it afterwards to me. Still my wife hasn't given him. "Happy," says Homer, "are those who died under high walls of Troy." Happier yet, say I, are those who live can eat what is set before them.

MARKET REPORT.

COFFEE.

The London Commercial Record of 22nd ultimo says:—Supp at auction have been rather larger this week, but are still moderate for the time of year. East India continues very du sale, and the small quantity catalogued was only partly dispose at easier rates, and there is no probability of improvement in demand till finer quality is to hand, and recent advices from I favor this hope. High prices continue to be paid for the colory sizes of Costa Rica, but for the second sizes there frequently a difference of 20s to 30s per cwt. For Guatemala other Central American descriptions there has been a fair dem at about previous prices. There have been some fluctuation the market for "futures;" the general tendency has bee higher rates, and the closing prices show an advance of 1s per for the week; yesterday business was done in March delivery 31s 9d, May at 32s 3d to 32s 6d, July at 32s 9d, Septe at 32s 9d to 33s, and December at 33s 4½d to 33s 6d.

East India sold to-day somewhat cheaper at the auctions to- whilst other descriptions were unchanged. Catalogues embr 2,254 bags East India, 238 bags Costa Rica, 27 bags Colom 380 bags Guatemala, 515 bags Salvador, and 601 bags unwa Dumont. We quote:—

TEA.

INDIAN.—Public sales were on a considerably reduced scale, *viz*:—
,000 packages compared with 54,000 packages in the week before,
d 48,600 packages at the corresponding period of 1900.
Partly owing to the smaller quantity brought forward there was
better tone accompanied by more general buying. Prices, how-
er, did not show much change except in the case of a few of the
ent arrivals where quality was attractive, quotations for which
rked a rise. Reckoning what is advertised for Monday next
3,000 packages have been printed during the month, against
3,000 packages last year, making 1,278,000 packages of the 1900
p which will have passed the hammer, *versus* 1,314,000 packages
the end of February twelve months since.
For 22,600 packages on estate account $6\frac{3}{4}$d. per lb. was obtained
sus $8\frac{1}{4}$d per lb. for 40,500 packages and $9\frac{1}{2}$d per lb. for 32,100
ckages in the two former seasons.
CEYLON.—On account of a dense fog prevailing on Tuesday the
ctions were postponed until the following day, when 19,600
ckages were offered. On the 12th instant 30,100 packages were
mitted and 22,000 packages at this time in the foregoing year.
There was an improved enquiry for nearly descriptions above
mmon parcels with "point" receiving good attention. Pekoes
d Pekoe Souchongs under 5d per lb. were about steady, but
voury kinds above that figure were in request and often dearer.
r the most desirable Broken Pekoes and choicest lots competi-
n was keen and as a rule an advance recorded.

The average is $6\frac{3}{8}$d per lb. in contradistinction to barely 6d per lb. on the 14th instant, and $7\frac{3}{4}$d per lb. in 1900.

JAVA.—Rather over 1,400 packages of direct import were included in the catalogues and went off quietly without material alteration in values, though a portion was withdrawn in consequence of limits not being attained.

For the 28th instant, 3,000 packages are declared.

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	20,401	3,629	24,030
Ceylon	18,186	1,390	19,576
Java	877	561	1,438
Total ...	39,464	5,580	45,044

Also 134 packages from second hands.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon and Java Tea Report, dated February 22nd, 1901, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1900-1901	1,290,107	947,117	42,832
1899-1900	1,337,967	897,918	43,328

26,522 *pkgs.* INDIAN
21,081 ,, CEYLON
1,438 ,, JAVA
} Total 49,041 packages were offered in public auction this week.

The Indian and Ceylon Associations have issued a Circular urging upon Planters the necessity for reducing the output of Tea, and suggesting various methods for accomplishing this object, such as restricting the plucking area, finer plucking, the manufacture of Green Tea, or the appropriation of tea for the exploitation of the native markets of India and Burmah. It adds a form of undertaking for proprietors to sign, agreeing to reduce their output by one of the above mentioned methods, or by any other practicable means.

The matter is of such importance that it is hoped the Circular will be largely signed.

Unless the output be in some way restricted, the prospects of the Tea producing industry appear to be very gloomy indeed. It has been found necessary and practicable to restrict supply in other trades by the shutting down of machinery and other ways, and thus to afford material relief in times of depression. Therefore there appears to be no reason why the depression in the Tea Industry should not similarly be relieved, if only united action can be assured on the part of the planting community.

INDIAN.—The Indian auction was very small, being less than half the quantity brought forward last week, or indeed in any week since the 4th January. Buyers were thus able to deal more easily with the sale, and prices showed a slight general recovery, which was most marked in useful liquoring Teas, common grades participating, but only to a very small extent; these continue to sell at very poor prices. The official were from Calcutta gives exports for first half of February as 3,310,000 lbs., against 2,200,000 lbs., making the total from 1st April, 1900 to date 159,310,000 lbs., against 148,092,000 same period last year.

Week's average of Tea sold on Garden Account 1901, 22,875 pkgs., av. 6·71d. 1900, 40,946 pkgs., av. 8·08d.

Total Tea sold on Garden Account 1st June 1900 to date, 1,068,962 pkgs. av. 7·33d. 1900, 1,047,388 pkgs., av. 8·35d.

CEYLON.—Only 21,081 packages were brought forward, against 31,521 last week. With reduced supplies of both Indian and Ceylon Tea the market steadied, and prices for all grades tended to harden, medium and good Teas being fully $\frac{1}{2}$d dearer in some instances, while common kinds frequently showed a rise of $\frac{1}{4}$d per lb. Private advices from Ceylon give shipments to United Kingdom for the first half of the month as 4,200,000 lbs., against 4,500,000 lbs. last year, and estimates the quantity for the month as 8,300,000 lbs.

Average for week 6·33d. against 7·65d. in 1900.

Ceylon Tea sold on Garden Account 1st Jan. to date, 194,471 pkgs., av. 6·42d. 1900, 202,203 pkgs.. av. 7·59d.

JAVA.—The sale passed with fair competition, with here and there slightly improved prices. All the Teas were on garden account, seven invoices being represented in the auction. 3,042 packages are advertised for sale next week. 570 packages are to be offered in Rotterdam on the 2nd March.

Bank Rate 4 per cent. Exchange on London' three months' sight:—Calcutta 1 $4\frac{7}{32}$. Colombo 1 $4\frac{1}{4}$.

COCOA.

There was little or no change in the feeling of the market on Tuesday when 2,572 bags were brought to the hammer. Demand was without life, yet holders adhered strongly to last week's values. Of 461 bags Trinidad catalogued about 200 bags sold—good to fine at 68s to 70s. 20 bags Jamaica realised 61s to 62s, whilst 2 bags St. Vincent brought 62s. Of 1,366 bags Ceylon about 250 bags were disposed of at about valuations, *viz.*, 1,015 to 1,023 for fine bold red 88s for good bold and medium, 62s for common dull small and medium, and 55s 6d to 69s per cwt. for common dark to good bright small. 38 bags Venezuelan, 500 bags Guayaquil and 178 bags Samana passed the hammer unsold.

PEPPER.

Black.—The market has been very quiet, but there is a steadier feeling at the close. About 200 tons Singapore have been sold for arrival—at 6 3/16d February-April shipment, at 6 7/32d to 6 3/16d March-May, and at 6¼d May-July. On the spot only small sales fair Singapore reported at 6 1/16d.

Supplies at auctions on Tuesday offered only 8 bags of grey Alleppy, for which 5¾d per lb. was bid in vain.

Sales of Tellicherry to an Italian outport at 55s 9d c.i.f. delivered weights are reported to-day.

The shipments of Black Pepper for the first half of February compare as follows:—

	1901.		1900.	
U.K.—Singapore	30	30	140	180
„ Penang	*nil*		40	
Continent		60		190
U. S.		170		210
Total tons ...		260		640

White.— is rather easier and business difficult For arrival about 20 tons have been sold, *viz.*, Singapore March-May shipment at 9 1/16d and Penang January-March at 8 7/16d per lb.

At public sale on the 20th instant 35 bags Singapore were bought in at 9¼d per lb.

The shipments of White Pepper for the first half of Febr compare as follows:—

	1901.		
U.K.—Singapore	60	160	80
„ Penang	100		240
Continent		100	
Total tons		260	

GINGER.

Cochin.—A somewhat dull tone has taken possession of market and the top rates of the past week or two are not obtainable. Catalogues embraced 4 cases 428 bags of which bags sold; good bright medium and small washed rough 35s ditto 33s, small to bold bright brownish rather shrivelled and 32s to 32s 6d, very rough and much small Calicut Sorts 31 one lot 32s per cwt.

Jamaica.—Was better represented than for some time past barrels being brought forward, about 100 barrels of which at cheaper prices, *viz.*:—Rhatoon at 33s to 34s, small and mec washed 37s to 39s, and middling washed at 40s 6d to 42s per cw

QUININE.

A considerable business has been done this week at advan prices. The depression caused by the heavy shipment of from Java passed away on the announcement of the figures of " to sale " shipments which were given as 825,000 half-kilos. T comparatively small figures threw doubt on the large half-mon shipments, and have active demand came from the United St and for daily purchases for "spot," so that the market closes at 1s 2d per oz. for spot and March, and 1s 2¼d per oz. for " Three-cachet " brand is selling at 1s 6d per oz. in Paris. B manufacturers have raised the price to 2m per kilo., and there been a strong demand, not only from Germany, but also f America and England, the Governments, it is said, being l buyers for China and South Africa.

(Average for all India 6·71d., February 22nd.)

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; lf-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two pees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 line for the first; As. 3 for the second, and As. 2 for the third and ceeding insertions. Five-line (or shorter) advertisements from Subscribers l be inserted for three issues for One Rupee; non-Subscribers will be rged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic urrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to E. C. DUFF & CO., Proprietors, lanting Opinion," 106, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 29th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Munzerabad.

March 18th.—*Weather*—wind north-westerly, tempurature 62° to 90° in shade, local showers. *Crop*—a shower of 55 cents fell on Saturday, and there is more rain in prospect, this should give us a further small blossom. *Works*—Pruning and manuring. *Health*—generally good. *Labour*—abundant. *Interesting item*—March and April being the marrying months for the villagers, processions with tom-toms and horns meet one everywhere.

THE TEA CRISIS.

It has been impossible for us to place before our readers all the many suggestions that have been made in respect to the present crisis in Tea. We have made no attempt to "boycott" those of which we personally disapproved while pushing those that met with our approval. Our selection has been guided rather by estimates of the inherent reasonableness of various suggestions, their practicability, and in a few instances the weight given to them by the names and reputations of the makers. So, in our present issue, we give publicity to suggestions from Mr. James Sinclair and Mr. Wm. Forbes Laurie, not because they meet our views, but because the remarks of such experienced planters merit consideration. There appears to be a feeling that the views of planters and the views of proprietary companies and merchants interested in Tea are at variance. We regard the subject, however, from the standpoint of neither. The sole object we have before us is to consider whether among the many schemes suggested there is one that offers a really good prospect of success, or if we can suggest something ourselves likely to help tea-planters in this time of dire trouble. The principle of "resting" a percentage of tea-shrubs appears to us to be manifestly unsound. It is unsound in theory. It has

been suggested that 10 per cent. of tea grown might be removed in another way, by buying it up, and then destroying it or using it as "samples" to open up new markets, etc. Here, again, there is the difficulty that heavy charges would have to be incurred to place this tea on the market, whence it was simply intended to be withdrawn again! Resting of 10 per cent. has the one plain advantage that it would save the expense of plucking, manufacture, packing, etc., in regard to the tea left alone in order to avoid over-production. Of its disadvantages we need scarcely touch again upon more than one: the grave risk of "rested" areas becoming nurseries of disease.

The Central Travancore planters appear to us to have come nearest to a wise decision. What is wanted is an immediate reduction of output. Well, get this by means of finer plucking, which will at the same time bring about an improvement in quality. Beyond this, expansion of consuming markets is wanted; get this, if possible, with the help of judicious employment of money raised by means of a cess. So far, Central Travancore's suggestions go. We would add to them this: that measures be taken to prevent the export to foreign markets, for consumption as tea, of anything below a certain standard. That all teas below that standard should be utilised for one or both of the following purposes; (1) for sale to chemical manufacturers for conversion into caffeine; (2) for free distribution or sale at cheap prices *in India* and for consumption in India by natives of this country. The initial difficulty in regard to developing a taste for tea among natives of India is to be found in the questions of packing and distribution. As regards the former, we believe that modern manufacturers could supply a cheap *paper* that would be quite good enough for one and two ounce packets intended for *free* (and prompt) distribution; we believe they might even give something that would do very well for "stock" purposes, where there is no special "aroma" to be preserved to the leaf. Such packets available, the Railway Companies would, we feel convinced, gladly quote special rates for the transport of tea, and it should not be very difficult to find petty dealers to undertake (1) the distribution of samples and (2) the sale of cheap teas. All that should be aimed at in the first instance is the creation of a taste for tea. That done, consumers would soon see that arrangements were made for the supply to them of all teas that they might require. The supply is available. Make the demand, and the two will very soon find ways of settling matters together. If India's millions can be led to purchase tea, the increase in demand will soon become clear enough, and the over-production bogie will be 'laid' for a time.

As for foreign markets, we are not unbelievers in Foreign Market Funds, and district advertising. We think, however, that advertising *alone* will not do. The stuff advertised must be available in the localities where it is advertised. Free distribution of samples should be resumed in countries where it has been tried, should be started in countries where it has not been tried, and should be continued until a taste for tea has been effectually cultivated among peoples to whom it is at present unknown. We believe more in stimulating consumption than in artificially checking supply. We believe in a wise appropriation of "tithes" rather than in a deliberate "chucking away" thereof, or a deliberate abandonment of shrubs that are in bearing. Where the planters' position is weak at present is, that he has so little control over distribution, that the price he receives is very generally out of proportion to the price the consumer pays, and that so many potential buyers are shut off because of their ignor These potential buyers do not know what to do with when they get it. They concoct a nauseating inf where they might be taught to make a delicious one, and condemn what they call tea simply because of their own ability to turn the leaf to the best account. It is n easy thing to remedy, but the attempt is worth making. too, is that of distributing tea at a minimum of cost regulating the profits of the middleman. Organisatio essential, however; so is capital. We should like to planters give attention to both points: organise for the pose of distributing good tea on the most economical ter utilise their collective power of attracting capital with a to placing their product in the hands of consumers at lowest prices consistent with the gaining of a fair pr Cheaper railage, cheaper steamer freights, cheap distribu charges, reduced profits to tea-dealers' are all things to aimed at, but always with a distinct recollection of "live let live" principles, without which enemies will be m where friends are urgently needed.

BORNEO COFFEE.

The following notice has been issued to the shareholders t he British North Borneo Chartered Company.

24, Rood Lane,
London, E. C. *December*, 19

The Borneo Coffee Coy., Ltd., is desirous of bringing the Co grown upon its Estates to the notice of those interested in Brit North Borneo. The area of land suitable for the growth of Co in the Chartered Company's territory is very large, and if a price could be obtained for the Coffee grown, the enterprise wo soon assume large and lucrative dimensions. The difficulty in troducing a new thing to the public is however great, and wit view to overcoming this, the Borneo Coffee Coy., Ltd., has b supplied by the Court of the Chartered Company with a lis shareholders, whom they beg to inform can be supplied at the ab address with:—

Pure Borneo Coffee, roasted (ground or whole) ...	@ 1/3	per lb.
Pure Borneo Coffee, raw	@ 1/-	„
Or with a slight admixture of Chicory (French style)	@ 1/1	„

in quantities of 1 lb. and upwards.

The charge for postage or carriage on 1 lb. will be 3d.; on qu tities of less than 5 lbs., 6d.; 5 lbs. or more will be sent carriage f

There is obviously not the same scope for the sale of Co *locally* in Borneo as in India. Yet the above appears offer a useful hint to the United Coffee Growers' Compa as to what it should eventually aim at. If its operations mainly confined to this country, they can scarcely be c ducted on a sufficiently large scale to materially affect prizes of Indian Coffees. The greater the bulk dealt wi the more beneficial will the work of the Company be to industry in behalf of which it was started.

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nic son's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf pe unable to procure the Ear Drums, may have them free.

Address—No. 989 D, The Nicholson Institute,
Longcott, Gunnersbur
[w. 26-5-00—26-5-1901.] *Lon*

U. P. A. S. I. SECTION.

(DER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

An Imperial Tariff.

The *Queensland Agricultural Journal* says:—We have re-ved from the United Planters' Association of Southern dia copy of a letter which has been circulated throughout British Empire to a large number of Chambers of Com-rce and other bodies concerned with trade in British com-nities. . . .

The principle enunciated in the above circular appears to to involve the question of Freetrade *versus* Protection. early it would be quite beyond the province of this *Journal* devote space to this intricate subject. We may, however, te that at the annual meeting of the Association of ambers of Commerce of the United Kingdom held at ris in September, 1900, it was pointed out by the Vice-esident of the British Chamber in Paris that the French overnment had established two tariffs of duties; one, the *rif minimum*, applicable to goods from countries enjoying ost-favoured-nation treatment; the other, called the *tarif neral*, applicable to goods from other countries. For cer-n articles, only one tariff was made, *tarif general*—all untries being treated alike. Some time ago, a difficulty ose with Brazil, which was the largest supplier of coffee to rance. The Brazilian Government considered that the ty of 156 francs per 100 kilos. (£6 10*s.* per 220 lbs.), or 1 per cent. of its value, was too high, and requested the ench Government to reduce it, which it refused to do. hereupon Brazil threatened to discriminate against France putting a heavy duty on French goods. To that, France plied by passing in the Chambers a law increasing the *rif general* to almost double its previous rates, not only for ffee, but for chocolate, pepper, spice, nutmegs, mace, oves, vanilla, and tea (very few of which articles were im-rted from Brazil), and making the previous tariff general o a minimum tariff, so that countries not having favoured-tion treatment—into which category come the British lonies—would have to pay the new *tarif general* rates.

As has been already pointed out, since that date Brazil has me to terms with France, and obtained favoured-nation eatment, as well as a reduction of duty on coffee from 156 ncs to 136 francs (law of 17th July, 1900). Brazil had us won her battle with the curious result that all other untries not having favoured-nation treatment had to pay arly double duty. In August a decree was signed by esident Loubet authorising the application of the minimum riff to such products from certain countries, including itish colonies, possessions, and protectorates until 31st cember, 1900, reserving the right to apply the minimum riff for two years from the promulgation of this law (24th bruary, 1900). If this were not done, however, the neral tariff would be applied on and after 1st January, 01; and even if the present concession were extended to full limit authorised by the law—*i.e.*, to 25th February, 02—the tariff general would then be applied.

The result would be that the following products of British colonies would have to pay the following duties on entering France :—

	Per 100 kilos. (220 lbs.) General Tariff. Fr.		Minimum. Fr.
Coffee (beans) ...	300	instead of	136
Do (roasted or ground) ...	400	,,	156
Chocolate (over 55 p.c. cocoa) ...	300	,,	150
Do (less than do.) ...	200	,,	102·25
Pepper	400	,,	208
Allspice, pimento, amomums, cardamoms, cinnamon, Cassia lignæ ...	400	,,	208
Nutmegs (in shells)	400	,,	208
Do	600	,,	312
Mace	600	,,	312
Cloves	400	,,	208
Vanilla	800	,,	416
Tea	400	,,	208

These were the circumstances which induces the Chamber of Commerce (Paris) to take action in the matter, and which have led to the present action of the United Planters' Associaton of Southern India. . . .

We foresee great difficulty in dealing with the principle of the resolution. Freetraders, to a man, must oppose it on principle, and we question very much if the British Government would run the risk of imposing countervailing duties, however desirable from the protectionist's point of view, which might have the effect of dislocating trade. It is a question which deserves to be argued in all its aspects, but it is one which cannot fail to once more bring forward all the stock arguments which have been used in the fights of Freetrade *vevsus* Protection. . . .

Commenting on the U. P. A. Circular *re* Differential Duties, the *Brazilian Review* says :—

The proposal of the Madras planters is not novel; under one name or another. "Fair trade," "Imperial Federation," or what not, it turns up whenever trade gets bad in the United Kingdom, or some special branch suffer from outside competition or unfair treatment. The experience of the planters in India is, however, no worse, indeed not half so bad as that of British sugar planters in different parts of the world, nor of many other industries that find themselves excluded from particular markets in consequence of the "Reciprocal" treatment of the products of other countries. The United States has in this manner, succeeded in obtaining certain advantages, and is, at the present moment, busily engaged in negotiating a treaty with this country by which flour, amongst other products, will be admitted at lower rates, and competition by her principal rival Argentina be quashed. The same principle will doubtless be extended by the United States and similar advantage be extorted for manufacturers unable to complete on equal terms with those of other countries.

The action of Brazil with regard to coffee shows that other countries will not be slow to follow so eminent an example, and it may easily happen that, in this manner, British produce and manufactures will, one by one, find door after door shut against them and be undersold even in their own markets.

That such a policy can be advantageous to any one in the long run seems scarcely possible. It may, it is true, help in the early stages to build up a new and struggling industry, but is certain to provoke resistance abroad and culminate in over-production and competition at home. An unfair advantage, such as preferential Customs tariffs afford, is invariably counteractive, soothing its beneficiaries into an illusive security, whilst stimulating competitors to renewed efforts. In a few years, in consequence, foreign methods are so improved that the advagtage of protection is lost and competition recommences fiercer than ever. There is no mechanism by which universal production can be kept within bounds except by competition. Let the United States strive and intrigue as they may to obtain preferential treatment for flour, for example, sooner or later, unless they can produce as good and cheap an article as in the Plate, they will be driven from that field. By exacting favours for their product Americans only drive Argentines to renewed efforts, to improve their methods,

and perfect their mechanism, and thus neutralize the disadvantage, until, at last triumphant, Argentine products will undersell American and once more master our markets; meanwhile production in the States will have been artificially simulated with the inevitable consequence of over-production.

The most instructive illustration of the dangers of monopoly is, perhaps, afforded by the coffee industry itself. Virtually without competitors, Brazilian planters, believing they could control the market, gave all their attention to coffee planting to the exclusion, in the coffee districts, of almost any other industry. The natural results followed:- Over-production with a fall of prices that has reduced coffee planting from the most lucrative to one of the most unprofitable of occupations, and involved the country in an economical crisis that threatens its institutions.

Had outside competition existed, things never could have arrived at such a pitch that not only does an area as big as Europe, exclusive of coffee, contribute scarcely anything to exports, but fails even to support its own population. Had foreign competition kept prices within bounds, other employments would not have been abandoned for the exclusive cultivation of coffee, capital and labour would have found their way into mining and other industries, and agriculture have been developed generally on the progressive lines of other countries. As it is, now that we are awaking to the inconvenience of monoculture, we find that we cannot even produce corn as cheaply as our neighbours, and, before we can hope to compete even in our own markets with their products, must learn the lessons they have long acquired, commencing from the A. B. C. of cultivation. It is not merely a prolific soil nor even a stimulating climate, but the knowledge how best to apply human labour to natural agents, and get the greatest advantage from them that enriches a people, which only comes of practice and experience; it cannot be improvised!

It is unnecessary to enlarge on other instances, such as sugar planting, to point the moral of the vanity of human invention when opposed to what say termed the "Nature of things." Production may be stimulated for a time by protection, by "Fair trade" or by absolute prohibition, but sooner or later the nemesis of over-production will destroy such advantages and competition recommence. What will be the position of protected sugar industries the day that "bonuses" cease to be paid and Beet sugar has to compete on its own merits? The moral, to our mind, that experience teaches here and everywhere, is to rely only on our own efforts and strive continually towards perfection in whatever we may be engaged: that is better than all the temporary advantages of Fair Trade or Protection in the World!

Few are, however, ready to adopt principles so fundamental for their rule of life, much less of policy, though their neglect is already threatening to cost England the loss of industries she thought secure. Impatient of results, it is imagined that physical or moral defects can be artificially corrected, and so, imitating others' bad examples, we are ever on the search for a new panacea.

It is true that a policy based only on perfection may and will entail material sacrifice until superiority at least be attained. Until we can succeed by the improvement of our methods in producing everything better and cheaper than our neighbours, any artificial advantages they enjoy will make competition on our part difficult, and sometimes impossible. Men, however, are impatient and care little for ulterior results, they want themselves to touch and to enjoy.

That, from this point of view, the trade of the Empire is exposed to disadvantages, more or less temporary, seems unquestionable. One by one our neighbours' doors are unfairly closed to us, whilst our own hangs open to all the world. But will Fair Trade, Federation or, to put it clearly, Protection help us? Will it not rather lead to renewed carelessness and to the indolence bred of security from competition?

But whilst advocating Free Trade in the fullest sense of the term, we do not believe that it will be long possible to control the feeling of resentment against the unfair treatment that British products are being successively subjected-to, as the ideas of "Reciprocal" treament, from which we alone are barred, spread from one country to another; before long, such a feeling must crystallize into action. To seek the point of least resistance at which the crystallization may be, if not encouraged, at least permitted with the minimum of injury to our own real interests that the process, however gentle, must entail, should be the care and object of those who direct opinion; and if any action must be taken, we believe it should be in the direction, not of prote but of the most absolute Free Trade compatible with fiscal req ments and removal of restrictions from the few remaining fo products yet subject to taxation. Allowing that duties on w spirits, and tobacco are indispensable for revenue and other poses, would it not be possible to abolish the only others that re on tea, coffee, etc., and thus place ourselves in a position to exact all countries equitable treatment for our own products on the favoured nation basis? If refused, reprisals in the form of d minating duties would then be justifiable and, if immediate an ulterior results only are aimed at, successful. Because afte Great Britain and her colonies are not only the greatest bu most progressive consumers in the world, whom no country w lightly sacrifice.

What Great Britain and her colonies want is, not protectio fair treatment, and that we can only ensure by treating all ali

COFFEE IN DISTANT LANDS.

XXIV.

B. C. Africa.—A Mlanje correspondent of the *Ca Observer* wrote on 7th January, 1901 :—

With regard to money-making in B. C. A. I know of two planters who have left the country for good hav made money at coffee planting, Messrs. J and D, the for some £6,000 and the latter about £3,000. The former only about six years here, and was fortunate in getting s 10 cwts. per acre from a coffee estate he opened up du that time, and his other investments proved good; so he out and has gone to S. Africa to start business in one of coast towns. The other was some 25 years in B. C. A. only about 10 years planting coffee, and he sold out—clear I was told, the above amount and is now living with Mrs in Scotland. It must be remembered that this countr young, and that the agricultural resources of the land h not yet been developed. There are few men with capita enable them to prove what can be done with the diffe products which might be, and are, grown successfully he most private planters have really got very limited means, everybody knows what uphill work it is anywhere work under such circumstances. We all know it requires mone make money, especially quickly, so give us a chance. I safely say, however, that there are no planters or others h up in this country, and all seem able to make a decent li either at planting or trading or something else.

The same gentleman wrote: We are going to have a short crop in Nyasaland this year; the blossoming se was upon the whole very unfavourable, being too Although we, in Mlanje, began well, the latter end of season was a scorcher, and with the dry heat came on unusual number of spotted bug, and thrips; the latter i bad as a severe dose of leaf-disease, carrying off the le and killing back the branches and withering up the c which drops off to single berries. Fortunately this latter only comes with a very dry season. I never saw ther Ceylon. Our trees are now making wood fast and throv off the thrips.

British North Borneo.—The following letters from T. H. Hill were considered at a general meeting of the Un Planters' Association, Straits Settlements, held at Serem on Monday, September 10th last.

1.

Mr. Gibson, the late Secretary, was good enough to write m letter dated March 4th, 1900. I went to see the coffee tha advises had been sent by Mr. Carey to Messrs. Sanderson & C had the smell that is so much objected to here.

This smell can be got rid of; as coffee that was cured by

rcher specially to send home was free of the smell. I believe it s got rid of by exposure to the sun only—after curing. I had ne coffee that was sent home *supposed* to be free of this smell, t it was not, but I managed to get rid of it by exposing to an en fire in a tin dish. So it is probable that heat exposure is all at is necessary, it is most important as affecting the value of e coffee here.

There will never be any market for this coffee up to its full ndard of value until the shipments have been made regularly d in fair quantities and of the best *sized* qualities. When a fair ality of Liberian is sold in London, it fetches from 7s. to 10s. re than the ordinary quality sold in London, which continues be "fair merchantable," a most distressingly low standard and e at which any planter would express disgust.

I am convinced that if the U. P. A. were to arrange to ship nthly 100 piculs of really good quality and of the best sized rieties with a good aroma, that Straits Crown Liberian could be rked up to sell at the standard of the higher priced Coffees, ich are now selling at 20/- to 40/- per cwt. over the ordinary azilian standards. To realise this position for the Straits coffee pears to me a matter for the planting community and not for the dividual, who would not be able to deal with it in so thorough a nner, or to such general advantage; when the Association have for me time sold to a high standard (and thereby created a market) e individual planter by curing to such standard will be able to ap the benefit of the exertions of the Association in which he has rne his *part*. As far as I can learn no extensions of Coffee Estates ve taken place during the last four years, the consumption has mittedly overtaken production and the out-look for growers is cidedly *bright*. It may be of interest to the Association to know at the Milreis of the Brazils worth at the time of the large areas ing planted 5d. is now worth 8d. and some time 8½d. and that ing to the redemption of its paper money and increased pros- rity from other trade than coffee-planting, it is more likely that e Milreis will increase in sterling value than fall, and thereby the raits planters are in a position to compete on more favourable rms than they were with the largest coffee country.

"Fair Merchantable Straits Liberian" has always (not with- anding its poor quality) sold for 3/- to 4/- more than Santos per t. and I can only get the opinion that this is because it has some the qualities of *Mocha* coffee. I hope that these matters may be interest to the planting community and if I can aid the Associ- ion in any way, please command me I shall be in London until ptember.

II.

London, 1*st August*, 1900.

Enclosed is a copy of certain remarks that I addressed last year the United Planters' Association in more general terms.

Having had the advantage of being in constant consultation and ceived the willing advice of one of the leading Brokers in Mincing ane, I feel that in putting these remarks before the leading plant- g community that I am doing as I would wish to be done by. he proposal does not appear last year to have received the consi- eration that I think that planters in their own interests might give , if the matter were under consideration in their own homes. I ve therefore posted copies direct to the leaders of the planting mmunity and I trust that this letter may be read at a meeting, at if inadvertently I have left any one out from having only a mited number of copies or inadvertence, they will not be offended think of the matter personally.

III.

9th July, 1900.

The bulk of the Malayan coffee is eventually absorbed by one arket, New York, a small proportion being taken by Germany his I have on the best authorities.

This coffee is, as a rule, sold on one standard or grade, *viz.*:—"Fair erage of the Season" at time and place of shipment but is some- nes sold on a standard or type sample which shows picking and eanliness only.

There are not as in all other coffees several standards.

The great fault is the careless preparation of the coffee, conse- uently a great deal when it comes here has a bad stinking rank smell. This can be eliminated by exposure to the sun in the East (ex- sure to open fires in this country *removes it*) but I do not see how e latter can be done.

What I recommended last year and would still recommend to the lanting Community is:—

1*st*.—That the Association should deal in coffee to the extent necessary to send some 100 cwts. or thereabouts to be monthly auctioned in the Sale Rooms in Mincing Lane as "Malayan Plantation Liberian" it should be subject to rigid inspection before being shipped, by at least two members of Committee, and freight should be engaged for it under guarantee, that it was not shipped with hides and pepper.

It should be carefully sized and lots as large as possible, (the bulk being 40 or 50 bags) *i.e.*, of one description as to size and quality.

It should be free of all rank smell and properly picked.

If this were auctioned monthly it would introduce a new standard on the London Market, *viz.* "Malayan Plantation Liberian." Such planters that desired to do so might avail themselves of this standard and reap the benefit by curing up to it, through the higher price their coffee would fetch.

It appears that such steps are well within the scope of the Association although outside the power of an individual.

To day the position of the Coffee Market is this:—

Consumption has greatly increased and production is likely to be smaller, as large areas of coffee were planted in the Brazils with exchange, Milreis (worth 2s. 7d. par) at $5\frac{1}{16}$d, now the Milreis is to-day 1s. $0\frac{1}{8}$d. and has been 1s. $2\frac{1}{2}$d.

Whilst the coinage of the Malay States has been 2s. and remains there for a 4s. 3d. dollar par value coin.

At a meeting of one of the largest coffee Companies at which I was present it was stated that the rise of 1d. in exchange on the Milreis increased the cost of production by 2s. 3d. per cwt.—since that speech was made exchange has risen 3d. to 4d.

It was also stated that the old Coffee planted by slaves, which had not been planted with maize between the rows was very much better than that planted by free labourers, *whose* inducement to plant coffee was that such free labour was permitted to *plant* maize amongst the coffee, and without such inducement, the position of labour would be trying and unsatisfactory. The injury to the coffee was *undoubted* and *admitted*.

Remedies difficult and doubtful.

The cost of realizing the proceeds of crops as shown in some accounts seen by me varies from 26,3 per cwt. to 29,6 per cwt. before the sale proceeds are banked, exchange $6\frac{1}{2}$d. and $7\frac{1}{2}$d. per Milreis respectively. Different amounts of crop form different averages. It follows that coffee cannot in this instance, *i.e.*, higher exahange, be produced under a cost of realising sale proceeds of 36s. $4\frac{1}{2}$d./39s. $7\frac{1}{2}$d. per cwt. This is fully borne out by figures that I made out before I left the Federated Malay States from papers handed me by Mr. William Coates. It is evident that the Malay Peninsula can compete with the Brazils in the cost of production of coffee. In the interest of all concerned the standard should not be left as it now is, *viz*:—"Fair average of the Season" and as I have already said it will be seen it is unreasonable to expect any one man to be able to deal with the matter, even if willing to face the delay and expense. I am informed that 24 monthly sales would probably suffice and when it is remembered that the export duty on Coffee is fixed on a sliding scale, and that the higher standard would pay the higher duty, it appears equally to the advantage of the Government and the planter that such further standards should be sought for, and the Government might fairly be asked to grant a sum per cwt. towards the expense of the Coffee shipped as indicated. The value is advancing and if such should be the case in the future each shipment would result not only in benefit to the members of the Association but possibly in actual cash profit as well.

Whilst at the worst the loss on each shipment could not be very large. There should not be any disappointment, if the first shipments sold at little above ordinary rates and it would be useless I am advised if the systematic shipments were interrupted. Therefore 24 shipments should be arranged for from commencement.

If the two standards are now established in future I believe it would be a step in the right direction to make Liberian coffee more popular and enable estates to carry on better in times of depressed markets.

The Brokers in London are most considerate and good-natured, but I deprecate individuals writing upon those matters separately; they would aid themselves and others by using the United Planters' Association to further the general interests, which would cover the interest of each member individually, and naturally received more attention than that accorded to individual effort.

NOTES.

"The Agricultural Ledger."

No. 21 of 1900 deals with The Cattle of Rajputana, No. 22 with The Cattle of Madras and of H. H. The Nizam's Dominions, and No. 23 with Moth-borer in Sugar-cane.

Tea and Cinchona in Bengal.

Agricultural Statistics of the Lower Provinces of Bengal for 1899-00 show that 132,900 acres were under Tea, and 1,300 acres under Cinchona.

Cinchona from Java.

It is reported that the shipments of bark from Java for the whole month of February are 727,000 Amsterdam lbs. against 705,100 lbs. last year.

The Coffee Problem.

The *American Grocer* remarks that the coffee problem is an enigma. "With a world's total supply for the year of 20,000,000 bags or more to meet requirements of 14,000,000 bags, what will be the future trend of the market? What always results when supply is in excess of demand."

Colombo Tea Sales.

At the public sale of tea at Colombo on the 18th instant about 11,600 packages = 905,371 lbs. were offered, of which about 8,655 pkgs. = 688,901 lbs. were sold. The last tea sale before the Easter holidays will be held on Tuesday, the 2nd April, and the first sale after the holidays on Wednesday, the 17th April.

Pushing Ceylon Tea.

The "Thirty Committee" has resolved, subject to the sanction of the Government of Ceylon, that Mr. Webster be granted a sum of £500 to be expended in advertising and pushing Ceylon tea in Honolulu, West Indies; South Africa, or North Africa, on the understanding that Mr. Webster do spend £1,000 for a like purpose furnishing accounts and statements; payment of the amount to be deferred until the middle of 1902.

Quinine in London.

The *Chemist and Druggist* remarks: —Quinine is again the feature of the week, and a considerable business has been done, principally in second-hands, at rising prices. On Wednesday the German makers advanced their quotation to 1s. 3d., but they have since sold at this figure and refuse to go on. The advance last week in citric acid is well maintained, and the tendency is still upwards owing to the higher prices asked for juice. Pressed camphor has been sold at full prices by the monopoly this week.

French Duties on Coffee.

Le *Journal Officiel* publishes a decree to rule to the 30th June, 1901, applying the minimum tariff to coffee produced by the German, British, Danish, Spanish, Dutch, Portuguese, and American colonies, the Central American Republics, Cuba, Porto Rica, Equador, Peru, Chile, the Congo, Abyssinia, Corea, China, Siam, and the Philippines. Coffee from other countries that entered French deposits between 24 January and 30th August, 1900, will enjoy the privilege of the minimum tariff to 30th June, 1901.

Coffee-retail.

It is useless, says the *American Grocer*, to attempt to build up a large and profitable trade in coffee unless the stock is fresh every day and the quality is of the best. Buy green of the right grade and have enough roasted for requirements. If your trade does not warrant such a then make connections with some reliable firm having quate roasting facilities, let them understand the exact of your trade, and then give them your orders and your dence. For the majority of retailers this latter cour preferable. There is more money to be made in selling than package coffee.

Tea for Caffeine making.

The *American Grocer* states mixture composed of about 90 cent. in volume of tea dust or sweepings, or refuse or d tea, the remaining constituents being slacked lime and tida, and which compound is intended to be used in caffeine, is exempt from duty under paragraph 548, A July 24, 1897, according to the recent decision of the U States Circuit Court for the Southern District of New *in re* United States *v.* Hensel *et al.*, and Hensel *et* United States, reversing G. A. 4188, which held tha merchandise was dutiable at one-fourth of one cent. per p and 10 per cent. *ad valorem*, as a drug advanced in v under paragraph 20 of said Act.

Brazilian Coffee.

The *Rio News* says:—A in the *Jornal de Commercio* pre a gloomy picture of the coffee industry in the State of rito Santo. The poverty of the planters, and the sca negligence, and inefficiency of the labourers employed, led to improper methods of cultivation and of harve which have greatly reduced the productiveness of the and injured the quality of the coffee. The average pr tion is less than thirty arrobas (960 pounds) per 1,000 The situation is aggravated by burdensome taxation. export duty, nominally 12 per cent., is really abou per cent. Besides, there is another tax of 200 reis per Many of the colonists on the coffee plantations have be disheartened and are leaving the State.

Adulterated Coffee in the U. S.

Food Commissioner J. E. B barn, of Ohio, has commenc campaign against adulterated c This was preceded by a notice to the trade that every in whose possession adulterated stock was found February 1 would be prosecuted to the full extent of the The following instructions were sent to every Deputy C missioner and Inspector throughout the State:

Columbus, O., Feb. 1, 190

To All Assistant Commissioners and Inspectors:

You are hereby directed to obtain, in the open market, six samples of every brand of roasted coffee and three samples of green coffee, known or believed to be adulte sizing, coating, or covering with any wax, drug, or other material or ingredient not a necessary part of the or berry.

Use great care in securing evidence and samples, and samples in hands of nearest chemist for chemical and microsc examination.

London Tea Sales.

Weekly telegram, dated 14th inst. from Messrs. Gow, Wils Stanton to the Colombo papers reports that the market g rally is steady, and that the market for medium Eq Pekoes and broken Pekoes shows a fractional advance; the market for common Pekoes and broken Pekoes is

udy. The price of fair liquoring Ceylon Pekoe Souchong 5d. (same as last week) and the average price of Ceylon sold on garden account this week was 6½d. (also same last week)—as against 6¾d. and 7½d. respectively in corresponding week last year. Reuter reports that fine alities of Ceylon tea realized full rates. Pekoe Souchongs quoted at 3¾d. (same as last week) and the average for week at 6½d. (one-eighth of a penny down) as against 7d. oted for Indian tea. 29,000 packages of Ceylon tea were ered for sale, of which 27,000 were disposed of; while of 49,000 packages of Indian tea offered 46,000 found purisers.

e Use of Coffee.

In a paper read before the New York County Medical Society, Dr. N. Love, of St. Louis, Mo., said: "Coffee, tea, and cocoa ntain practically the same active principle, but coffee conins the largest proportion of this substance—in other words, the strongest. The psychical satisfaction produced by these verages at meal-time is of much importance. Coffee-houses diciously placed and managed would undoubtedly solve the loon problem. "Taken with the meal, coffee is likely to sturb digestion. When I desire to restrict the diet in the eatment of obesity, I advise the use of a cup of black coffee the morning, sandwiched in between two cups of hot water. hen used in this way, it stimulates peristalsis and favours gestion. At the same time, it removes the desire for food, id enables one readily to become a member of the 'noreakfast club.' "The after-dinner cup of black coffee is an xample of the wrong use of coffee. Coffee taken as indited, without cream and sugar, acts admirably, and represents hat should be the proper and habitual use of this beverage. he emergency use of coffee for night-work is all right, if one judiciously; that is, only as an occasional practice."

ea Consumption in the U. S. in 1900.

The following statement, compiled from the reports of the United States Bureau of Statistics, shows that consumption of tea in this country is below the average of the n years, 1887—96:—

		Pounds.
ea in Warehouses, December 31, 1899		41,729,509
mports in 1900	96,384,696	
ss exports in 1900	1,176,736	
Net Imports		95,207,960
Total supply		136,937,469
ss stock in Warehouses, December 31, 1900		54,968,778
Consumption in 1900		81,968,691
nsumption in 1899		73,063,072
verage yearly Consumption, 1887—96		86,782,955

The above does not take into consideration stocks held by bbers or retailers, the quantity of which is not to be tained. As the *American Grocer* observes, the figures show at the consumption of tea is not increasing. In 1887 and 888 the average net imports, regarded as consumption, ere much larger when the population was 16,000,000 less. Evidently the people are drifting away from the use of tea, favour of coffee, cocoa, and beer."

eylon Green Teas.

A further appropriation of Rs.30,000 has been sanctioned for the payment of rants on Ceylon Green Teas. By the way, the *Ceylon bserver* writes:—We understand that the most recent Canadian advices received in Colombo point to an oversupply of Green Teas in the Canadian market. This being so, the present and intending makers of greens will be well advised to hold their hand for a while and not take their share in increasing the supply too rapidly. In spite of the fact that Canada *does* provide a good market for our greens, it is none the less true that its development is only beginning and, if it is hurried by an occasional rush, much harm will be done; it needs slow and steady cultivation. Upcountry there are factories to be found where green tea machinery is all ready, but is not yet being used for its purpose, practical caution being exercised and delay made, until the demand for Ceylon greens becomes more definitely marked. Nevertheless when Green Tea makers have once got to work, it is as well they should continue a regular supply to the local market, for nothing is more likely to put off the American buyers than irregular deliveries by their agents here, who are entirely in the hands of the producer as far as constant shipping of the same kinds is concerned. Local sales, however, have not been encouraging to the growers who have hesitated to go in regularly for greens—several lots recently being withdrawn on account of insufficient bidding.

LETTERS TO THE EDITOR.

THE PROPOSED TEA CESS.

DEAR SIR,—I notice that in your issue of 9th March you perpetuated an error made in reporting by a Calcutta Daily paper and in doing so you not only put into Mr. Topping's mouth what I said, but you make me out an opponent in conjunction with Sir Patrick Playfair of the proposed tea cess. Instead of "Mr. H. S. Ashton and Sir Patrick Playfair have spoken" you should read "Mr. H. S. Ashton said Sir Patrick Playfair has spoken" and so on.

Inasmuch as I have just been elected Chairman of the I. T. A. it is perhaps advisable that it should be clearly understood that I strongly approve of the proposed cess. The proposal has been made as an alternative to the present method of obtaining voluntary subscriptions for advertising purposes which for seven years has resulted in an annual collection of about a lakh. In 1893 this sum might be considered respectable, but I think I am justified in saying that the failure to increase subscriptions as the output of tea has increased daums the voluntary system as inefficient and justifies a resort to other methods if new markets are to be thoroughly exploited by Indian tea. Of course there are proprietors who deny the value of advertisement by other than private enterprise, and their influence may be sufficient to block the way, but it is also quite certain that there are a number who are willing to share the cost of exploiting new markets, and who do not now subscribe, if provision is made to protect them against subscribing more than their share. The cess will meet their views, whilst I think it must be pretty obvious that those who have for years been doing more than their share will get tired of the present system, because, if for no other reason, "it is so difficult to tax aud please" and there is just as little pleasure in the process whether you impose the tax yourself or not.

There appears to be another body of people interested who approve of all the exploiting that can be done, and who suggest far more expensive schemes than any yet attempted.

At the same time they deprecate the intervention of Government, who they seem to fear would keep the tax on when the object for which it was imposed ceased to exist or, in other words, would divert at some time or other to their own uses, funds specially here marked. In view of the proved efficacy of the Ceylon system and in view of the practical failure of the Indian voluntary system I would ask such people whether it is worthwhile opposing the tax because they hold the theory that the Government of India is shameless, for that is what their argument amounts to. Sir Patrick Playfair's suggestion is to distribute over 5 million lbs. of tea (3 per cent of the crop) this year in India and he thinks the cost of administration may be covered by sales, but not any part of the value of the tea. I thoroughly approve of something of the kind being done, but after seven years' experience on the I. T. A. Committee during which the difficulty of obtaining money has been in constant evidence and the crippling effects upon all operations of the uncertainty as to funds voluntarily subscribed I would rather see the Committee, which will shortly be formed to exploit India, commence operations with a solid fund behind it such as the proposed cess would bring in. The industry has never risen beyond a lakh a year by voluntary effort. If you value the 5 million lbs. of tea above referred to (the cost of which it is thought will not be recovered) at -/1/- a lb. It will cost the industry over 3 lakhs, at -/2/- over 6 lakhs and it is at least fair to infer that it will be difficult to get such a subscription responded to after past experience. The Committee having to find ways and means will undoubtedly be greatly handicapped and any scheme they may decide to adopt will consequently be delayed to the detriment of practical work.

To those who believe in advertisement and yet hesitate to support the cess I suggest the above points.

H. S. Ashton.

GENERAL ARTICLES.

THE PRESENT CONDITION OF THE BRITISH TEA INDUSTRY.

A SUGGESTED REMEDY.

Mr. Wm. Forbes Laurie writes :—

My best introduction to show that something must be attempted to improve the condition of the British Tea Industry is by bringing to notice the result of the last public sales. The average price for the week for Indians was 6·12d. for Ceylons 5·88d.—say a joint average of 6d.

The capital invested in the British Tea Industry, three years ago, was computed by one of the best authorities in London, to be *fully 30 millions sterling*. One question naturally arises, is the position urgent enough to induce all producers to unite in an organised system which would place the regulation of price entirely in their own hands? If so, I can point out an automatic and simple process by which this can be accomplished.

If any one will take the trouble to enquire among grocers, he will be told that for one customer asking for better *there will be ten asking for cheaper teas*. So pronounced is this preference that two years ago when a large quantity of inferior Oolongs were *condemned as unfit for human food* in America, they were shipped to London, where, wholesome or unwholesome, they were consumed with every satisfaction. The present condition of the market means that a large proportion of British-grown teas are in the true sense of the word not competed for; also most first-class teas do not attain any stability of value.

What is wanted is *immediate relief*.

Were it not for the arbitrary action of the Indian Government in th interests of British stockholders, and naturally by no means disap proved of by the services, our position to-day would not be s desperate as it appears; for if the so-called exchange had not inter fered with the natural condition of the industry, its 30 million involved would yield at least 4 per cent. more than it now affords, an no *special* action would be necessary. Since then, the increase of dut from 4d. to 6d. has aggravated the position. Also taken in connec tion with all this, that five years is necessary for tea gardens to com into full bearing and it will be seen that the industry as now con ducted is practically "*out of hand*," and that some systemati regulation is necessary; for as now working any slight rush of tea would in the future place us *again* as we are at present.

In Great Britain, means of overcoming the evils of over-pro duction and competition are becoming general, so we cannot d better than follow their example. Labour, Brewers, Distillers Coal, Iron, Thread, Screws, Fish, and Wall-paper have all com together under Unions and Associations for this purpose, and hav mitigated extreme competition and unwise over-supply, otherwis profit would, sometimes, have disappeared. Two years ago I mad this subject a special study and, although I found only one industry went so far as to declare, "That my trade is my politics," inter course showed me that in most cases *they were by no means* behin "The Trade." They admit that if the pendulum can be kept at fair figure of profit, neither too low nor too high, that over-com petition can be regulated and that over-supply is checked. Thus if the tea-growers can maintain Indian and Ceylon teas, *say*, withi a joint average of from 8d. to 8½d. (inclusive of all grades sold i the market), the object desired will have been accomplished. Te could never under-supply the market for over four months together there are sufficient abandoned tracts of tea-land which a rise woul bring into production.

The position now is one in which it is considered that there ar 20 million lbs. more tea in stock than the market requires.

The tea market is an extremely sensitive one, so I should not pu the surplus down as much more than *half this*, with a possibility o a slight access of increase when the new season teas arrive.

There are already two reducing factors at work,—the making o "greens" and finer plucking, but these, like all economical adjust ments, work fatally slowly and in the meantime we are losing a least £50,000 weekly for mere want of control.

THE REMEDY.

Nothing can be done without a central organisation which I shal hereafter call "The Association," formed, say, from the Indian and Ceylon Associations. This being accomplished, let all British tea growers agree to submit to a Cess on the sales of their teas of ⅛ to ¼d. per lb., to be in all ordinary cases collected by the Brokers, and with this Cess form a fund. If London would initiate the project Calcutta and Colombo would readily join on quitable lines. The Fund would be used to buy up all teas say under 5d. to begin with in the open market; then higher, if necessary, and so on; which inferior teas would be treated as a by-product, for it is open to doubt whether these benefit the market, the trade, or the consumer. The public would get better tea, *and growers a living wage*, for I presume the Association would fix the average price of tea at about 8d to 8½d.; more than that would lead to excessive new production It will be seen that the scheme once started is self-operative. I believe we need go no further than London for a precedent

To proceed, say the average sales weekly in London, Calcutta, and Colombo are $\frac{1}{52}$ of 364 million lbs. *i.e.*, 7 million lbs. The Fund would become a new buyer in the market of, say, to begin with, at least 350.000 lbs. weekly at 5d and of the very teas which clog the markets. It would also be more affective in a low than high market although the choice of teas operated upon would be altogether in the hands of the regulating board. Personally, I do not believe the market could stand this strain a fortnight without going up ½d at least.

Suppose we then increase the Cess to that ½d. instead of ¼d., *we should even then be no worse off than we are at present*. There is no doubt as to the result,—what would it be? In the first instance the over-supply would be *practically non-existent*. The tea price average would automatically become 8d. to 8⅓d., of course *plus* the Cess. In three months the Cess might be reduced to ⅛ or $\frac{1}{16}$, or it might cease altogether. In no case do I believe, at the severest period, more than 5 per cent. of tea would be set aside and that the average would be less than 2 per cent. of what the market would be better without.

Now let us see how this would affect the consumer. In the long run *not appreciably*, for he would still be protected by supply and demand. It the Association exceeded a fair price, it would know that the market would in consequence be over-supplied. After all the consumers would not feel the Cess when the duty, already 6d., is fully 80 per cent. of the value; the addition of the Cess would be absolutely immaterial, yet providing a fair return to the growers.

When a sensitive market is supplied by a product 6,000 to 9,000 miles away, requiring five years to bear to its full, any extreme rise of price, or the reverse, must be severely felt. The result is, either, *such as unduly increases extensions;* or, on the other hand, establishes a price *disastrous to the grower.* So unless the pendulum can be reduced to a shorter swing, the sooner the owners of 80 per cent. of the aforementioned 30 millions sterling make up their minds to write down their capital the better.

I most thoroughly maintain that being in possession of any commodity we can by disposing of 5 per cent. of this in any way we choose, establish a fair price; in the interests of shareholders, superintendents, and others, all of whom must suffer, if we fail in doing so, then we shall be guilty of culpable unwisdom. I may again repeat, that any forcing up beyond a fair price would be suicidal, as a quiet sufferance of the present conditions will be.

How far growers in London are prepared to enter into a project of this nature could be determined in a few days, and three months afterwards the market would be in hand and a living wage secured.

London, *February 20th*, 1901.

NOTES.

Great Britain will not tax food products, but taxes luxuries, in which alcoholic drinks, tea, coffee, etc., are included. The London industry, I would use as a precedent, deals with food.

Showing the immaterial proportion that ¼d. Cess would have upon cost of 1 lb. of average tea to consumer:—

5½d.	Cost to producer sold in London	32·35 p. c.
1¾d.	Fair return to grower	10·30 „
1 d.	Cost Distribution, Blending, etc.	5·88 „
2½d.	To Retailer	14·71 „
6 d.	Duty	35·29 „
¼d.	Cess (1-68th of 17 pence)	1·47 „
17 pence.		100·00 of 17d.

N.B.—¼d. Cess would mean that high-priced teas paying 4d. per lb. profit, would only pay 1-16th of the profit in Cess; while ordinary teas paying, say, 2d. would pay ⅛ of their profit to the Cess.

OVER-PRODUCTION WORKING ITS OWN CURE IN FINER PLUCKING.

Mr. James Sinclair writes to the Colombo paper:—

With your permission, before leaving for London, I should like to make my contribution to the subject which is occupying all our minds at the moment, *viz.*, the question of restriction of the output of tea.

The "bogie" of over-production which has been rung in our ears now, almost ever since the industry came to any proportions in the island, has apparently overtaken us, and is acting like a nightmare, causing curtailment of credit and crushing the very life out of many a hard-working planter, to say nothing of causing hard-headed men in the city to lose their heads and to devise impracticable nostrums in their anxiety to mend matters.

No doubt the position of the tea market is serious, but looked fairly and squarely in the face, is there any reason to suppose that the natural laws which are set in motion when any market becomes glutted will not operate if indeed they are not now in full force here?

If we examine carefully how this glut of tea has come about it will, I think, enable us to arrive at a true appreciation of what has happened, and how it will mend itself long before a scheme of the kind we have had sent to us from London, could operate at all, even if it would accomplish the object arrived at.

I am one of those who hold that if Ceylon had continued to supply the quality of tea it did seven or eight years ago, instead of there being a glut in the market there would have barely been sufficient to meet consumption. It is overlooked I think, the almost indefinite *quantity* a tea bush can yield if quantity not quality is the object.

The competition amongst packet dealers when prices were cut so low to consumers, led the way to planters going for quantity produced at a low cost, and this became emphasized when the rupee was artificially raised. In fact production of large quantity was the only means at the disposal of most low-country tea-growers by which a profit at all could be worked out. The limit the market can take has been reached sooner than might have been the case but for the rush of leaf last October-November and the fact that dealers had their funds locked up in larger purchases to meet a possible rise in the duty. Otherwise it might have taken still coarser plucking, and another year, to glut the market as it has

Now, fortunately, the working of the natural law which is already in force remedying this condition is simplified by the fact that a reversal of the system which has brought us to this pass can be put in force in a day, and is thus different from, say, a cereal crop which, when sown, must be harvested and thrown on the markets and no reduction of stocks can take place for at least a year.

What has the most dense planter been saying to himself for the last three months, I allude chiefly to growers of the more common teas? He has been saying "unless I turn out a much finer tea than I have been doing, I shall finish my season at a loss," and from my recent visits to most of the districts much finer plucking is being resorted to, nay has been since the beginning of this year. Now any experienced planter will tell you that the difference in yield between medium and fine plucking may be all the way from 50 lbs. to 100 lbs. per acre less, and between coarse and fine almost anything. Well, let us suppose that half the area under plucking in Ceylon (and I am certain I am on the safe side) plucks 100 lbs. per acre less than last year. That is from 200,000 acres (half of 400,000 acres which is the total) we see no less than 20 millions disappearing without the introduction of drastic schemes. We must, however, add to this reduced output, that which will come from fields not plucked last year, which would probably amount to 3 million lbs., and so a fair estimate of what will disappear from the output of last year may I think be set down at from sixteen to seventeen millions —and but for the abnormally suitable weather for the tea bush which has ruled all through these months since the year began, and usually the worst of the year, a very pronounced restriction would have been visible in the shipments ere now. There is, however, a certain comfort in the knowledge that there cannot now be the usual rush of leaf for April-May when a great deal of our worst teas are made—a dearth of flush through the usual dry weather is invariably followed by rapid growth during April and May, but not so in the event of weather such as we have had prevailing through January, February, and March.

But there is another factor, and a very important one, which must also be reckoned with in dealing with tea yields.

Every one is agreed that all round, taking the last two years, the most splendid weather for tea flushing has ruled. If we could not prove this by examination of the different Companies' annual reports where the same tale runs through all of them, *viz.*, estimates of crop largely exceeded, it could be done by a walk over the tea districts. I know the greatest difference since I was here three years ago in the increased size and freshness of the bush, whether manured or otherwise. Consider then what one untoward season as regards weather may effect in restricting output. If you ask an experienced planter to what extent a bad year may reduce his yield, he will put it at from 50 lbs. to 80 lbs. per acre. and we all know *individually* that it will. It would be entirely misleading to point to our ever-increasing annual output in disproof of this. Young fields have been coming to the pluck yearly so far, and makes it appear that weather will not affect or vary the total output, but a day is fast approaching, if indeed it has not arrived, when Ceylon crops alone will vary one year from another owing to good or bad seasons as much as 20 millions a year. That is when all young fields are in full yield.

I have been dealing with Ceylon alone, but if I am right regarding what I have here set forth about tea it applies to India as well and I do happen to know that instructions to planters there have arrived to the effect that finer plucking must be the order of the day. Consider then the restriction this must cause in dealing with an area of half a million acres.

I cannot, therefore, but think that serious as the market position is City merchants are playing into the hands of the dealers by over-estimating its seriousness, for its reversal is entirely in our hands, and at the moment is being worked out. I would ask those gentlemen who feel inclined to throw up the sponge to have a little patience, to perhaps bestow, on the whole, a little more attention to their factories and the details of manufacture; exorcising from their minds some of the senseless cuckoo cries always rampant in Ceylon, such as "Tea is made in the field"—which is only the case in the same sense that porridge is made in the oatfield—"Manuring is the curse of the enterprise" on the one hand; "It is the sole cause of over-production," on the other; "it is a most

dangerous thing to do" as "it must force growth and so end in killing the bush." Surely if there is ground for the latter the gentleman who takes credit for *unselfishly* abstaining from its use should be pleased, as according to him the days of the manured fields are numbered, especially if he uses sulphate of ammonia as an ingredient.

No, I firmly believe before August next there will be a dearth of tea visible, and a very different complexion will come upon the tea market, credit, etc.

I had almost omitted to notice one point in favour of the early disappearance of the excessive stocks in London. The fact that dealers are overloaded with teas at 3d. and 4d. will prevent orders going to China for that class of tea; hence I should expect this year to give that trade the *coup de grace* and so work off the surplus stocks of Indian and Ceylon teas in a very short time.

I feel satisfied nothing can come of the present scheme for restriction of plucking area, and when I arrive in London I intend to endeavour to have one agreed upon which I submit would be more workable and efficient in reducing yield.

If those interested in the enterprise will sign assent to give instructions, say on the 1st December next, so far as Ceylon is concerned, that no tea shall be made in their factories for that month, and in the case of India for October, their last manufacturing month, we should see an immediate response in price, because the dealers would know that restriction was meant.

I would propose to put this in force only if most of my contentions are not verified before that date by a considerable falling off in shipments, or a much better price ruling for teas.

By this scheme evasions as in the other one for restricting plucking area would not be possible. A man might contrive to sweep off every shoot at 30th November and would take care to have a good flush coming on early in January, but it would certainly reduce output from 8 to 10 per cent., whilst my opinion is the other would not take 2 per cent. off. Save the loss of the tea for December, which would be more than made up for in price. The only cost it would probably entail would be the labour, going round, say, about 20th December to break down the runaway flush and to have the bush in condition for January.

FREIGHT ON COFFEE.

The arrival in the port of New York of the Lamport & Holt's Line steamer Rossetti with a cargo of 126,000 bags coffee from the port of Santos is quite significant as marking a new era in the coffee-carrying trade. The Lamport & Holt Line is the oldest established line of steamers in the coffee-carrying business from Brazil to the United States, and this line owns an enormous quantity of tonnage. So also do the other two important lines engaged in this trade, the Prince line and the Robert M. Sloman Line.

Going back some twenty years it was considered quite an event to get a cargo of coffee from Santos in excess of a total of 10,000 bags or from Rio of about 30,000 bags, and in the old days of the Baltimore clippers it was quite a circumstance to have a whole cargo of 12,000 or 15,000 bags of coffee come in here belonging to one firm. The enormous jump during the interval can be understood when we look at the cargo by the Rossetti, of which nearly 75,000 bags belong to one house in New York, representing a total value of about $750,000. It may be interesting to our readers to see the manifest of the cargo with the names of the consignees as given below:

Santos — Bags—in New York.

73,000	to W. H. Crossman & Bro.
300	to Heidelbach, Ickelheimer & Co.
18,240	to London & Brazilian Bank.
4,300	to Brown Bros. & Co.
1,000	to National Bank of Commerce.
4,000	to Guaranty Trust & Co.
500	to Winter & Smillie.
2,000	to Merchants' Banking Co.
3,000	to London & River Plate Bank.
6,026	to The Bank of New-York.
250	to Schulz & Ruckgaber.
1,006	to The Thomson & Taylor Spice Co.
1,499	to British Bank of South America.
6,550	to "Order"
*7,500	to various parties.

*About.

The first conclusion to be drawn from the above is the present enormous producing capacity of the coffee plantations in Brazil, the combined Rio and Santos crops having increased from an average of about 5,000,000 bags in the 14 years from 1882 to 1896, up to an average in excess of 9,000,000 bags the past four years, and which prospects of going far beyond this figure in the next crop. It is not alone that an occasional steamer like the Rossetti, with a capacity of 130,000 bags of coffee, comes here from Brazil, but the entire coffee carrying fleets consist of much larger and better boats than those belonging to the old school

The necessities of the business have led to the building of such steamers, and without such good tonnage available in that trade Brazil would find it a very difficult matter to be able to store the surplus of their crops. As it is the port of Santos is strained to its utmost capacity to store the coffee, there being some 1,400,000 bags of coffee now held in warehouse in that city. New York is not alone in receiving large coffee cargoes as mentioned above, the ports of Hamburg, Havre and the Netherlands receiving at times very heavy cargoes.

The stocks of coffee held in the principal seaports of Europe are now the largest ever known, say about 8,000,000 bags, which goes to show how the stocks have accumulated as the result of the increased production the world over, besides which the stock of coffee now in the seaports of the United States run up to over 1,000,000 bags.

The development of the shipping capacity for handling coffee is an evidence of the enterprise of the different steamship lines engaged in this trade, and it can further more be stated not only are the steamers of extraordinary capacity, but they are well built and the arrangements such as to offer best ventilation of the coffee during transit.—*New York Journal of Commerce*, Dec. 17.

COFFEE AND CINNAMON IN LONDON.

The "Rooms" bore a more cheerful aspect during the present week than they have done for some time past, says *The London Commercial Record*. An improved state of trade was, of course, the sole reason for it. From the animation in the coffee trade and from the loud bidding and counter-bidding emanating from the corner behind the pillar, it was evident to the most casual observer that a change for the better had come over the market. As a matter of fact the bulls were at last having a few "field-days" in the terminal market and were driving prices up at a most satisfactory rate, much to the discomfiture of bears, who had calculated on much lower prices ere a change for the better would set in. No doubt their anticipations would have been realised had not the American Copper Ring taken it into its head to buy up Brazilian Coffee, its low price appearing to the members of the Ring attractive and safe enough for an investment. The purchases of this clique have been the reason and unfortunately the only one, for the recent spurt in prices. The disquieting point in the whole affair is that nobody appears to have any knowledge how far the American bulls are determined to drive prices, the moment therefore, America stops buying, the terminal market immediately displays signs of weakness and prices give way. Possibly the example set by the Yankees will encourage the bolder element on this side of the "herring pond" to follow suit and lend by their purchases additional strength to the market. So far participation has not been very much in evidence, and the fact that actual coffees have not been affected by the rise in the terminal market appears to us not a very promising omen for the future of coffee. Spot lots of all descriptions—except the very finest—continue to realize wretched prices. It seems altogether a most thankless task to hold goods on the spot, the demand for them as a rule does not exceed the limits of a retail trade, and the profit in the end is generally swallowed up in heavy dock charges, interest, and incidental expenses. It is a wonder that the total of consignments to our port is still such a considerable one as it really is. Evidently, in spite of all we hear about the marvellous doings on the Continent, we are still holding our own although the competition from the other side of the Channel is getting keener almost every day and the absence of the pleasant little orders which used to find their way into our market is painfully felt. The result of this week's quarterly cinnamon sale would probably have been a vastly different one were London still the distributing centre of the world. Being dependent on its own consumption and a few stray foreign orders, the quantity offered

for sale, about 2,000 bales, proved far in excess of the requirements, and a dull, uninteresting sale ensued. Holders seemed determined to meet the market, and in order to do so had to accept a decline of ½d. per lb. for ordinary, 1d. for good, and 1d to 2d. for fine quality. Even at this reduction the demand was but a poor one, and not more than about three-fifths of the whole quantity offered found buyers. So far Colombo has remained unaffected by the result of the sales, but, hard as it may try, it cannot fail to feel the effect of a bad London Quarterly Sale, and lower values may be expected unless, indeed, something unexpected should happen, like it did this week in pepper and quinine, when a sudden demand prompted planters and manufacturers to put up their prices, thereby frightening bears into covering and encouraging bulls to buy. The tone in these latter markets has become a firm one, and it remains to be seen whether bulls are strong enough to maintain the improvement.

BRAZILIAN NOTES.

(From the *Brazilian Review.*)

Exchange—*February 2nd*, 1901.—Ninety days' rate on London opened on Monday 28th ultimo at 19 1/32d., rose to 10 3/16 on Friday 1st instant, and closed in the evening 10 5/32d. Saturday being a holiday.

Happy the country that has no history and the market when exchange and all relating to it is as dull and unprofitable as now. For over five months exchange has oscillated between the narrow limits of 9 3/4d and 10 1/2d. to the advantage of business of all kinds. If only it would go on in the same manner for a year or so! But such a prospect is too bright to last, and within two or three months at least we shall have the annual boom upon us once more. One thing is evident, that the "bears" have been able to make no headway whatever and that in spite of our being now nearly into the dullest season of the year when bills always commence to get scarce, not only is the rate steady but there seems no inclination whatever to go for the fall. The explanation is the scarcity of money: from Dan to Beersheba, money, money, is the cry and, instead of a loaf, the unfeeling Minister presents a stone, and goes and burns a lot more shinplasters! All the same it is the scarcity of money to play with that alone keeps up exchange just at present, that and the equilibrium of foreign payments.

Sales were a little better last week 164,000 bags at Rio and Santos against 156,000 the previous week and 121,000 last year; but coffee prices again relapsed to an average of 7·01 cents and f.o.b. value to 34s. per bag.

A few bills were reported to be offered from Pará and Pernambuco, but not enough to lift the market out of its lethargy.

The value of the coffee sailed last week was £114,352 against £269,726 the previous week and £321,279 last year. From 1st July to 1st February the total value shipped is £13,298,938 as compared with £10,643,270 during the previous corresponding period.

During the month of December paper money to the amount of R13·613:448$ was exported by this market of which R4·500:000$ went to Pará and Manáos and R8·000:000$ to Sao Paulo. In return only R1·593:565$ were received, half from Pernambuco.

The movement of money along the coast shows that the total exports by this market to other States during the past year amounted to R74·096:679$ and receipts to R51·106:900$ including the movement on the Central Railway.

Coffee.—Entries at Rio and Santos during the week ending February 1st were again very considerable in spite of the rain, being 67,616 more than the previous week's and 78,455 in excess of those of the corresponding week last year.

The weather continues to be wet and stormy and to give much trouble to the railways. What state the country roads must be in when even railway traffic is interrupted we shudder to think! Innumerable bridges have been completely destroyed, and in the present general hard-up condition scarcely seem likely to be replaced. The Bananal branch line has lost two bridges and had a lot of the permanent way washed away. The proprietor says he has no money and can't repair the damage; so unless something is done to assist, it seems likely that that district will have to return to the primitive system of mule back for transport. That of course means extra expense, about 400 reis per *arroba* more than before. As we pointed out before, such continuous rain cannot be good and in the long run seems bound to affect the volume of the coming crop as well as its quality. Sad stories, too, are coming-in regarding the lack of labour and of money to pay for it, but if the coffee is there we do not doubt it will be picked somehow and marketed even if prices keep above the absolute cost of delivery. However hard up *fazendeiros* may be there are always people ready to buy on the trees or work on shares rather than be idle. The trouble will come when exchange begins to boom again unless stocks can be worked off before that. The current crop is turning out much bigger than anyone expected, already exceeding that of 1899-1900 by 459,000 bags whilst there is said to be a lot up-country waiting to come down. Anyhow it will go over 9,800,000 for Rio and Santos alone. Such a crop if followed by a bumper year cannot fail to weaken the trees and result in a smaller crop in 1902-1903.

A Coffee Trust.—Coffee is going down and, consequently schemes to bolster it up are again putting in their appearance, the favourite being an invention of Dr. Salvador Mendonca's, originating, we believe, in the fertile Yankee brain, to give the monopoly of export to a Syndicate that, on its side, shall undertake to purchase all the coffee offering at a fixed rate, actually considerably over market prices. If it were not for the interference with individual rights and the sacrifice of principal that such a scheme would entail, the best way to quiet such visionaries would be to let them try the experiment, when after dropping a few millions they would probably get tired of it and discover, as the Copper and similar Syndicates before them, that the laws of supply and demand may be interfered with but cannot be abolished by Syndicates or anyone else. If we have too much coffee it will go down in spite of all the Syndicates in the world.

S. Paulo.—The yield of coffee in Theophilo Ottoni promises to be enormous this year. Hands for gathering are very scarce there.

The weather in S. Paulo and district appears to be engaged in a record-breaking enterprise. the downpour of rain having been such for the last day or two that floods and inundations may be looked for.

During last year, on account of the contract of 6th August with Fiorita & Co. and Jose Antunes dos Santos & Co., 10,755 immigrants entered the port of Santos: Italians 7,047, Spaniards 2.097, Hungarians 795, Portuguese 245, and Sundry 31.

In Mogy-Mirim the crop of pine-apples (*abacaxis*) is so large that many planters have given up gathering them, the price obtained in the market not being sufficient to pay the labour.

The Secretary of Agriculture will shortly distribute seed of a new variety of *capim* (long grass used for forage) which gives two crops during the year and is extraordinarily nutritious.

Accounts from Ribeirão Preto state that the coffee, maize, rice, and bean plantations give promise of heavy crops this year.

Experiments are to be made with Egyptian coffee in this State, the seeds having been imported and offered to the Secretary of Agriculture by Messrs Lion. & Co. of S. Paulo.

In Casa Branca the flowering was good, but the fruit is so unequal that some planters will probably have either to incur the expense of two gatherings, or lose a third of their crops.

ORANGE CULTURE IN SOUTH CALIFORNIA.

The following excellent article on Citrus Fruit Culture in California is taken from *Chambers's Journal*, and may be accepted as authoritative :—

The culture of the orange-tree has greatly increased in South California within the last few years, despite the many difficulties the growers have had to contend with. Florida was once the largest orange-producing State in the Union; Riverside, a country in the South California, is now the largest orange-producing district in the world. Even Covina, a comparatively new orange-section, also in South California, last season (1899) shipped 100,000 boxes more than the whole State of Florida. Given suitable soil and plenty of sunshine, irrigation and cultivation have done to the rest; and

the result to-day is thousands of acres of beautiful trees in bearing, averaging about a hundred trees to the acre.

The celebrated "seedless navel orange," first produced in Riverside, practically gave South California its world-wide reputation for orange-growing; and this orange has completely thrown into the shade other varieties—such as Mediterranean Sweet, Valencia, Ruby and Malta Bloods, St. Michael's, and others less known. Growers have discovered that, for size, flavour, and steady bearing, no other orange can compete with it.

The first year of the orange-tree's life in the orchard is a most critical period in its existence, because it has just been transplanted from the nursery, in which, during its growth for three or four years from the seed, it has been carefully nurtured, and is then worth from 50 cents to 1 dollar—that is, 2s. to 4s. The young trees are planted in the orchard in rows accurately measured off, 18 by 20 feet apart.

The Washington navel orange-tree fruits the first year in the orchard, but is only said to be in bearing the third year; and from that time it must be fed and watered with the greatest care if, at the age of twelve years, it is to produce 700 lbs. of fruit. Many of the most successful groves are of comparatively old growth, planted some twenty-two to twenty-five years ago; but the health and productiveness of these trees have been maintained by the generous expenditure of fertilisers—often amounting from 1 ton to 1½ tons to the acre, consisting of guano with necessary proportion of potash and sulphate of iron—and also by the regular irrigation in Summer every thirty days, and by incessant cultivation of breaking up of the soil which is so apt to become baked by the sun. In the first instance the virgin soil, is extremely fertile, but it cannot be drawn upon year after year with impunity; and the pioneers discover this, to their loss, when the decadence of their orange-trees became evident. Young orchards pay while the soil is virgin, but it is no economy to spare either water or manure, after the first year or two of bearing, if the orchardist wishes his trees to maintain their productiveness. Some growers state that slight blemishes on oranges denote too rich feeding of the trees; but I believe this opinion is held by a minority.

The grower has practically nothing further to do with the oranges after they leave his orchard; the sorting, cleaning, grading, and final packing for the market are in the hands of the Association packing-houses—unless, of course, the grower himself has been able to establish a brand and a packing house of his own. Usually the grower is supplied with boxes by the Association, and into them the oranges are loosely packed by his pickers, piled up on waggons, and taken into the packing-house. There the teamster receives a cheque or credit note for the owner, and these are kept three or four months, and used to check the amount then receivable from the Association. The price depends on the kind of season, also upon the grade of orange and runs from about 90 cents (3s. 7d.) or 1 dollar (4s.) up to 2 dollars 50 cents (9s.) a box, the average being 1 dollar 15 cents (4s. 7d.).

The first process at the packing house is to weigh the fruit, and label it with the name of the owner, then put it aside for the brushers. In large houses the brushing is done by machines; in smaller houses by boys and girls, who use small hand-brushes. Generally the packing machine is conveniently placed so that the oranges roll down an incline to the sorter's table. Here imperfections only are noted, the quick and critical eye of the sorter rapidly rejecting the "culls" as they are called—namely, those oranges even slightly discoloured or blemished. Great piles of these "culls" may be seen in labelled bins ready to be sold to the peddler for 10, 25, or even 50 cents (½d., 1s., 2s.) a box; if totally unsaleable they are returned to the owner, and scattered over the orchard and ploughed in as a fertiliser. The next process is that of grading, by which the oranges are sorted according to size. The grader is a somewhat intricate machine. From the hopper at one end, the oranges roll down an incline by the side of a revolving cylinder, along each side of which are two long slits widening towards the end, each size falling through its own special chute into a box below. The three grades of marketable oranges are the fancy, the choice, and the standard. After being graded, the oranges next come into the hands of the packers, who are marvellously dexterous in their handling. They stand in front of the box to be packed, with the bin of oranges on the right and a bunch of tissue-paper wrappers on the left. Swiftly the right hand takes an orange, simultaneously the left hand seizes a wrapper, a sound of crumpled paper, and-hey, presto!—the orange is in the box. The last layer is left slightly protruding above the side of the box; over this are nailed three or four thin laths, with a space between so that the air may have free access; and from the nailer the box goes direct to the road car. Many houses have a siding to the warehouse door. About 36 boxes, weighing 13 tons, are piled carefully into a car; the car is then sealed up, ventilators only being open; a large ticket is tacked to the side to tell where the fruit came from; and at last the oranges are ready for the swift freight train to carry them eastward.

The packing-houses are extremely interesting, and in many instances have cost from 10,000 dollars to 15,000 dollars (£2,500 to £3,750) each, being equipped with the latest machinery run by electricty, gasoline, or steam-power. Quoting from the annual mid-winter number of the *los Angelos Times;* "Last Spring the assessment returned 2,072,417 bearing orange-trees and 1,227,397 trees in their first year's growth. These citrus trees produced in 1897, in cart-loads in 1899. The value of the output of 1899 is given by the Chamber of Commerce as 7,000,000 dollars."

Lemons are included in these assessments, as the railroad lines make no difference between the two shipments when reporting for the trade; as a rule the shipment of oranges is nearly double that of lemons. To the uninitiated there is little difference at a first glance between an orange orchard and a lemon orchard; there is the same precision in planting the same glossy leaves, the same fragrant white blossom; but, unlike the orange, rarely does one see the lemon in its yellow rind, for it is picked green, and thus the tree is divested of its beauty, for the green lemon is an insignificant object. Latterly the orange, owing to the rivalry among the growers to be the first to ship the oranges to California, has been gathered unripe; but these early shipments have brought so little profit to the growers that the fruit is generally allowed to remain three months longer until it is ripe and luscious for the table. Lemons are picked every month in the year; while oranges blossom in April, and the fruit ripens and is shipped from December of that year to June of the following year.

As yet nothing has been done to utilise the large number of "culls" but, as in France and Italy, manufactories will, no doubt, be started to obtain acids and essential oils from these "culls" when the enormous water-power available in the mountains at whose feet so many orchards lie, has been fully developed.

Many difficulties have been encountered in the orange-culture of South California, of which not the least has been the white scale, an insect pest which threatened at one time the entire destruction of the orchards. Hundreds of acres have been ruined; the trees seem to be covered with snow, so greatly infected had they become. The climax was reached in 1888—99, when meetings were held by the growers, and the idea was mooted that some parasitic insect should be found to wage war upon this white scale. Half-a-dozen lady-bird beetles were imported from Australia by the Agricultural Department, and liberated in an orchard; and in about a year the white scale totally disappeared. Other scales caused trouble, but to no great extent. Fumigation is successfully resorted to, each tree being covered with a tent, inside which is liberated cyanogen gas. The fumigation is done at night to prevent decomposition of the fumes by the sunlight. It is a curious sight to see a whole orchard enveloped in these coverings, like a huge encampment on a field of battle. Frost, too is an always expected danger, but it is not experienced to the same extent as by the Florida growers, and frequently two or three years will pass without any danger being done. Wind is almost as great an enemy as frost, for the waving of

THE ART OF SINGING.

BY SIMS REEVES.

"Remedies for the Throat."

"All kinds of lozenges for the voice are to be avoided; some do harm, others have no effect, and none do good. Sugar and water, or a little glycerine, gives relief when the throat is inclined to be dry; this applies to persons whose throats are affected by the weather. About a third of a teaspoonful of Condy's Fluid in a tumbler of water, if used as a gargle every morning, will clear the throat and brace up the uvula, which, in some singers, is so long that it interrupts the pure emission of the voice, and introduces a grating undertone, while it also tends to make a tremolo on the upper notes."—*The Idler*, February, 1900.

he branches causes friction between the leaves and the oranges, he latter being more or less scarred thereby. Great loss, too, is aused by the windfalls, hundreds of oranges being lost to the grower before they have come to perfection. Frost, however, may e considered an insidious enemy, and on that account it is more ifficult to fight, for its effects are not immediately apparent; instances have occurred in which the oranges have actually been hipped eastwards in good condition even to the eye of the grower nd the packer, only to be declared unsaleable, as, on being cut open, he pulp was found almost rotten. An experiment to obviate the ction of wind and frost has been tried—to house the trees collectively nder one immense framework of wooden laths so placed at intervals s to admit the sunlight and air, but sufficient to break the force of he wind. This scheme has been carried out successfully on the Everest Ranche, Riverside county, with such good results that the production of 17 acres thus covered in has far exceeded that of any previous ear. The more common expedient is to plant eucalyptus trees in long ows across the general direction of the wind, thus forming a breakvind, much in the same way as the tea and coffee plants in Ceylon re protected.

Notwithstanding all drawbacks, orange-growing is a pleasant and ucrative occupation, especially when carried on in such a healthgiving and equable climate as that of South California.

THE PROSPECTS OF COFFEE.

Regarding the prospects of coffee in 1901 Messrs. Duuring nd Zoon express their opinion as follows :—

"Prospects for the new year are scarcely in favour of strong narkets, whilst advices as to the next crop, 1901-1902, report it as ikely to be very heavy. Besides, there seems to be considerable nisunderstanding as regards the extension of consumption in aking the heavy deliveries of 1898-99 as a basis, which were chiefly ttributable to heavy transfers of *Visible* to *Invisible* stocks during he period of very low prices then ruling, and explains why deliveries have ceased growing this year, but allows expectation of a resh extension in 1901."

Le Bulletin de Correspondance du Havre is of a somewhat similar pinion to that we expressed sometime back, that coffee prices will e firm or rising during the first half of the current year, and weak r falling during the second half.

There are, however, so many and complicated factors to be taken nto account, that prophecy is, to say the least of it, extremely azardous. It is true that a tremendous crop, probably considerbly in excess of immediate consumption, must be faced, that alone would certainly entail a heavy fall of sterling prices. But against his the almost certainty of a much smaller crop for 1902-1903 must e placed, and the influence that rising rates of exchange may imultaneously exercise. We do not pretend to fix a minimum urrency rate at which coffee will cease to come from the interior, ecause it must vary with the circumstances of planters and of ocality, but believe that the prices already reached are to say the east of it, rapidly approaching that point. No doubt the coffee lready in stock will be shipped at any price, but will new coffee be ent down if it is certain to leave no profit and perhaps, a loss?

There is unquestionably a minimum currency price that, as far as ew coffee is concerned, cannot be passed. Once that price be eached, it does not matter what the relations of supply and demand may be abroad, sterling prices cannot fall any further unless ccompanied by a fall of exchange, by which currency prices might e maintained. On the contrary, in spite of the prospects of a ecord crop, should exchange happen to rise, as there seems some xpectation of its doing, sterling prices would be obliged to rise *ari passu* also.

The danger of the situation lies in the possibility of a gigantic ear movement during the second half of the current year when he bills sold in advance are being delivered, and the reaction to he periodical rise, that accompanies the opening of each coffee eason, has set in.

The scarcity of available bills might then force down exchange nd enable foreign markets to buy more cheaply whilst maintaining he indispensable currency minimum. In this manner the fall of coffee prices and of exchange would react upon each other and inevitably give rise to a dangerous (bear) movement in both, that, if unchecked, might have the most serious consequences.

It is possible, however, that the prospects of a small crop for 1902-1903 may correct these tendencies to some extent, but, in face of the inevitable speculation for the fall, this cannot be much relied on. It would be far better to meet the enemy squarely and fight him with his own weapons, by restricting the supplies and holding back our produce for better times.

If it is true, as is generally believed, that the 1902-1903 crop will be, perhaps, only half of that for 1901-1902, the policy that planters should pursue is unmistakeable—to keep all the coffee they can and only market what is absolutely unavoidable.

On their side we believed that the Bank of the Republic and Government should make preparations for the bad time awaiting exchange at the close of the year, by accumulating every possible note that can be laid hands on and taking all the exchange possible when rates are booming in April or May, to resell when they commence to fall again towards the end of the year and thus, perhaps, save the situation and prevent a *debacle* in both Coffee and Exchange.

It is a pity that the 25,000 contos that are to be burned this year cannot be applied to this object. No doubt the restriction of the currency will have a steadying effect upon exchange, which would, however, be certainly neutralized and counterbalanced by speculation. Utilized as we propose, the results would be to greatly reduce oscillations and, by preventing too violent a rise, to restrain speculation and restrict the subsequent fall. In compliance with the terms of the funding arrangement, it might be agreed to burn the paper as it came in against re-sale of the bills. A double effect would be thus produced just at the critical moment, the supply of bills would be augmented and the supply of money, which consitutes a considerable factor of demand for bills, would be reduced.

Heaven helps those who help themselves; so let us look to it and not trust only to luck in this, perhaps, the most critical page of our financial history.—*Brazilian Review.*

DISTRICT ASSOCIATIONS.

NELLIAMPATHY.

Proceedings of a Meeting held at the Victoria Bungalow on the 8th instant. PRESENT :—J. C. Abbott (*in the Chair*), H. de Coucy-Dening, A. R. Jones, G. H. Welchman, and W. R. M. McKenzie, *Honorary Secretary.*

Roads.—Read correspondence with President, Malabar District Board, on the state of roads near the boundary. The Association notes with pleasure repairs have been carried out. Read letter to Chief Engineer, Cochin State, asking for a new bridge in place of No. 4, Western road, Plateau section. Read letter asking Chief Engineer to expedite the erection of new bridges on Karidi Mulla section, materials being all ready. Read letter calling attention to the urgent necessity of improving or re-erecting bridge No. 2 between Poliyampara and Padagherry.

Police.—Read correspondence on this matter and Honorary Secretary instructed to write and ask Acting Superintendent of Police for his report on the local police.

Sanitary Board.—Read letter from Dewan that the revised scheme had gone up to the Resident for sanction. Read telegram from Dewan that scheme has been sanctioned and orders were being issued. Recorded with satisfaction.

Postal.—Read correspondence with Postmaster-General and his consent to give the local Postmaster hill allowance.

Isolation Hospital.—Read correspondence on urgent need of above. Honorary Secretary to write to Mr. Jones, of Padagherry, asking him to recommend his proprietors to grant a portion of abandoned land near proposed hospital site.

(Since the meeting the Dewan has issued orders on the above).

Salt and Abkhari Peons.—Read correspondence with Assistant Commissioner complaining of frontier peons. The Assistant Commissioner has kindly ordered up an Inspector to hold an enquiry.

Apothecary.—Honorary Secretary reported that the Apothecary had agreed to accept horse allowance and reduced fee of Rs. 2 for each private visit, having provided his own horse.

Mr. G. H. Welchman was appointed Acting Honorary Secretary.

The proceedings closed with a vote of thanks to the Chairman.

(Signed) J. C. Abbott,
Chairman.

(„) W. R. M. McKenzie,
Honorary Secretary.

INDIAN TEA ASSOCIATION (CALCUTTA).

The following are extracts from an abstract of proceedings of the first meeting of the General Committee elected for the year 1901, held on 6th instant. Present :—Messrs. H. S. Ashton, H. C. Begg, H. W. Boyd, R. H. A. Gresson, W. Holder, A. Magor, A. Tocher, and R. R. Toynbee.

On the motion of Mr. Begg seconded by Mr. Toynbee, Mr. Ashton was unanimously elected Chairman, and Mr. Tocher, Vice-Chairman for the current year.

Considered a letter No. 492, dated 21st February, from the Director of Land Records and Agriculture, Assam, asking for the average prices realised for Assam tea during each of the three-quarters ending respectively on the 30th June 1900, the 30th September 1900 and the 31st December 1900. It was asked that the prices for the Brahmaputra Valley and the Surma Valley should be shown separately. At the Committee's request Mr. O. B. Griffiths, of Messrs. Moran & Co., had kindly compiled the following averages :—

Average prices of Tea in Calcutta.

				As.	P.
Brahmaputra Valley—					
For Quarter ending	30th June 1900 ...	1,916	packages...	5	7
Do.	30th September 1900 ...	53,174	do. ...	7	1
Do.	31st December do. ...	47,096	do. ...	5	9
Surma Valley—					
For Quarter ending	30th June 1900 ...	14,569	packages...	4	9
Do.	30th September 1900 ...	94,656	do. ...	5	3
Do.	31st December do. ...	84,661	do. ...	4	6

Average prices of Tea in London.

				d.
Brahmaputra Valley—				
For Quarter ending	30th June 1900 ...	53,942	packages ...	9·03
Do.	30th September 1900 ...	100,340	do. ...	9·80
Do.	31st December do. ...	224,075	do. ...	8·46
Surma Valley—				
For Quarter ending	30th June 1900 ...	41,355	packages ...	6·24
Do.	30th September 1900 ..	70,590	do. ...	6·35
Do.	31st December do. ...	131,913	do. ...	5·85

It was decided to forward these figures to the Director of Land Records and Agriculture, Assam, in response to his request. But a note was to be added to the effect that they could not be considered as accurately representing the average prices for the season of 1900-1901; as the tea season extended in Calcutta from the 1st April to the 31st March, and in London from 1st July to 30th June. For the same reason the London averages for the quarter ending 30th June 1900 referred to tea manufactured chiefly during the season 1899-1900.

Copies of a circular, relating to the proposed reduction of output, which had been issued, on the 14th February, by the Indian Tea Association (London) and the Ceylon Associations in London were to be distributed immediately among all Agents of Tea Estates. In the circular support was invited to a scheme for curtailing production, which had been prepared by a Joint Committee of the two Associations in London.

INDIAN TEA ASSOCIATION.

The following are extracts from an abstract of proceedin of a meeting of the General Committee held on 12th Marc Present :—Messrs. H. S. Ashton (*Chairman*), A. Toch (*Vice-Chairman*), H. C. Begg, H. W. Boyd, W. Brow W. Holder, R. Magor, and R. R. Toynbee.

The Hon'ble Mr. J. Buckinghan, C.I.E., was present by invitati

Before the ordinary business of the meeting was proceeded wi the general arrangements under the new Assam Labour a Emigration Act were discussed ; and a hearty vote of thanks w unanimously accorded to the Hon'ble Mr. Buckinghan and t Hon'ble Mr. Henderson for the valuable services they had render to the industry in connection with the measure.

Letters of 1st, 8th, 15th, and 22nd February, from the Secreta Indian Tea Association, London, were brought up for final conside tion and disposal after previous circulation. The chief matters de with in these letters were :—

Proposed restriction of output.—In the proceedings of the meeti held on the 6th March, it was stated that copies of a circular, dat 14th February, which had been issued jointly by the Indian T Association (London) and the Ceylon Association in London we to be forwarded to all agents of Tea Estates. In remarking up the circular in his letter, dated 22nd February, Mr. Tye stat that the following firms had signified their intention to reduce ou put, *viz.*, Messrs. Jas. Finlay & Co., P. R. Buchanan & Co., Octavi Steel & Co., and Stewart McLeod & Co. The list of Compani included the Assam, Nedeem, Imperial, Lungla, Derby, Easte Assam, British Assam, Looksan, East India and Ceylon, and Ch gola Tea Companies.

The General Committee noted this list of adherents with satisfa tion. They also had before them a number of letters (in reply their Circular No. 6 of 19th January) containing many sugge tions for reducing output. Judging by the letters, however, the did not seem to be much likelihood that any one plan would generally supported. Seeing, therefore, that in accordance with t terms of the London circular, producers could decide for themselv within certain limits, as to the method by which the reducti should be effected, the Committee recorded their unanimous opini that it should receive the support of all who favour restriction output. They thought it desirable to call attention to the fact th the only question asked in the circular was weather each produc would agree to reduce his output by a certain percentage, provid that producers generally agreed to reduce the total crop by t million lbs. for India and eight million lbs. for Ceylon. T Committee also wished specially to point out that no produc would be bound by his undertaking to curtail his output unle sufficient support were received to ensure the reduction of t total crop by the amount indicated.

It being of importance that prompt action should be taken, t Committee hoped that the replies of producers would be return as speedily as possible.

Bounty on Green Teas.—It was stated in the proceedings of t meeting held on the 22nd January, that the London Committ were to be asked if there was any objection to the bounty bei allotted on their green or *namuna* teas; and also if the quanti upon which the bounty might be paid could extend to 250,000 l From the remarks made, in reply, in Mr. Tye's letter, of 15 February, the General Committee understood there was no obj tion to their proposal being put into force. But in view of the fa that the manufacture of green tea is one of the methods whi (according to the London Committee's circular of 14th Februar producers may adopt to reduce the output of black tea, they agre to take no steps in the way of again offering the bounty pendi the decision of the industry upon the question of reduction.

It was, however, agreed that a Sub-Committee should be appoint to consider, in the meantime, the general question of the princip upon which the bounty should be allotted in the event of its bei offered. The Vice-Chairman and Mr. H. C. Begg consented to a as the Sub-Committee; and it was understood that they would co sult the experts engaged by the Association regarding any poin upon which expert advice might be required.

Messrs. Finlay Muir & Co. were to be asked to procure fro

ylon a chest of each grade of a good standard Ceylon "green" tea r distribution in samples among Managers.

British import duty on Tea. In Mr. Tye's letter, dated 22nd ebruary, it was stated that in London it was considered extremely probable that any addition would be made to the import duty in e forthcoming Budget. A joint letter from the Indian and Ceylon ssociations would be sent to the Secretaries of State for India d for the Colonies asking that the Chancellor of the Exchequer ould be approached with a view to the partial remission of e duty.

French import duty on Tea.—With the same letter Mr. Tye for-arded a copy of a communication from the Secretary to the ritish Chamber of Commerce in Paris upon this matter. In this tter paper it was stated that negotiations were proceeding be-reen the French and the British Governments for some arrange-ent which would enable British Colonial produce to come under e tariff minimum. Nothing definite had, however, so far been ttled.

Considered a file of papers in connection with the question of the le of tea in India.

After some discussion the following resolutions were unani-ously adopted:—

(1) "That a Sub-Committee be appointed to consider generally e question of increasing the sale of tea in India; to submit a efinite scheme and to advise as to the provision of the funds and e organization which would be required to put the scheme into ractical operation."

(2) "That a recommendation be made to the London Committee the Association to the effect that a sum of Rs.5,000 be appro-riated from the American and Foreign Market Fund for the rpose of meeting the initial expenses of any scheme that may be ventually decided upon."

The Hon'ble Mr. Buckingham, Mr. H. C. Begg and Mr. W. Brown nsented to serve on the Sub-Committee, and the following entlemen were also to be asked, *viz.*, The Hon'ble Mr. R. H. enderson, Mr. D. King, of the Bank of Calcutta, Mr. H. R. cInnes, of Messrs. J. Thomas & Co., and Mr. W. T. Carter, of essrs. W. S. Cresswell & Co., with power to add to their number.

Considered a letter, dated 14th February, and a telegram, dated 1st February, from the Honorary Secretary to the Kangra Valley lanters' Association, respecting the sale of Indian tea in Persia. the letter it was stated that the Kangra planters proposed to send caravan of a hundred camels (carrying 32,000 lbs. of tea) into ersia by the Nushki-Seistan route from Quetta. It was under-ood from the telegram that the caravan would start some time uring June or July, and the General Committee were asked if the ssociation were desirous of supplementing the quantity mentioned. ooking to the fact that Mr. Foley had recently started for Quetta a similar mission, the Committee decided to await his report, nd to take no further action at present beyond drawing the atten-on of members by circular to the opportunity of sending tea into ersia which would be afforded by the proposed caravan.

Considered a letter, No. 640-P, dated 27th February, from the overnment of Bengal. Political Department, covering a copy of communication from the Government of India, Foreign Depart-ent, regarding the possibility of facilitating the trade in Indian a with Chinese and Russian Turkestan. On the 3rd November st the Committee approached the Government of Bengal upon is subject. They pointed out that there was no doubt that tea, some form or other, was extensively consumed in both the ountries indicated. It certainly was in Chinese Turkestan; but was almost entirely China tea. In localities comparatively near the Indian frontier the consumption was said to be about 80 per ent. Chinese to 20 per cent. Indian. In the more remote pro-nces the proportion of Indian tea was believed to be very much ss. The Indian trade with Chinese Turkestan appeared to be ractically unfettered so far as import duties or restrictions were oncerned. Not that no duties had been levied by the Chinese overnment, but that they were not enforced. The supreme ob-acle in the way of establishing a trade upon an extensive scale emed to the Committee to be the difficult and hazardous nature the journey from India to Kashgar—the chief centre of trade. he only route believed to be open was that *viâ* Kashmir, Leh, nd Yarkand. The longest section of the journey, that between Leh and Yarkand, occupying thirty days—was over one of the worst possible roads, in some places rising to an altitude of 18,000 feet. There were, however, as the Committee were informed, two other roads from India to Kashgar, both of which were much shorter and offered fewer obstacles to the transport of heavy merchandise. One of these roads was that known as the Peshawar-Chitral road; and the other was a road running from Abbottabad through Gilgit and Hunza Nagar and thence to Kashgar. The journey by either of these roads would take only one month, while by the Leh-Yarkand route across the Karakorum mountains it occupied at least two months. The Committee, however, understood that the two shorter roads were kept closed by the Government of India for political and strategical reasons. And as there appeared to be no possibility of an extensive trade in Indian tea in Chinese Turkestan being established if the roads were to remain closed, they asked if there was any likelihood of the two roads, or even one of them, being opened to traffic in the near future. The matter had been referred to the Government of India by the Government of Bengal; and in the Foreign Office letter already mentioned it was dealt with in some detail. The letter stated that both the road from Peshawar to Chitral and the Gilgit-Hunza roads are open to traders from India. The drawbacks to the former are that through Dir and Swat traders would be exposed to some risks which, in the present state of the country, cannot be obviated; that for a portion of the year, the Lowarai Pass is closed by snow; and that in Wakhan (through which State the road runs) traders would probably be compelled to pay the same heavy customs and transit duties as the Amir levies in Badakhshan. Regarding the Gilgit road it was pointed out that beyond Gilgit the physical difficulties of the country and the scarcity of baggage, animals, and supplies are such as to render it improbable that the road can come into general use for the purposes of trade with Chinese Turkestan. Several improvements which have been lately carried out on the Leh-Yarkand route were also specified in the letter. And it was added that even if the difficulties of the Gilgit and Chitral routes were fewer, it was improbable that they would attract much of the trade from the older and better known road.

The Committee noted that the information in the letter from the Government of India differed materially from that previously before them. And they decided in the first place to forward copies of the letters to the Honorary Secretary to the Kangra Valley Planters' Association and to the other correspondents with whom they had been previously in communication upon the matter.

MARKET REPORT.

[*Per Mail advices of* 1st *March* 1901.]

COFFEE.

The London Commercial Record says:—The principal feature this week has been the larger supply of East India offered at public sale; many of the samples shewed a great improvement in quality, and these met with good competition and sold at full prices, whilst for less desirable kinds, although the demand was slow, there was much more bidding than hitherto, and the bulk of the supplies sold at rather easier prices. Privately fine short-berry Mocha sold at 92s. A small quantity of colory Ceylon sold at firm prices. Colory Costa Rica continues to attract attention, but other qualities are rather in buyers' favor, and the same may be said of Central American descriptions generally. There have been some changes in the market for "futures," but the general tendency has been to higher prices, and the market, closes with a steady tone at the improvement. Auction supplies to-day totalled 664 bags, of which about 1,800 bags were of East India growth. The sales to-day went off very well and dearer for fine qualities. We quote:—

London ...	... Santos ...	May delivery	... 33s 10½d.
New York	... No. 7 Rio...	,,	... 6·35 cents.
Hamburg...	... Santos ...	,,	... 33½ pf.

TEA.

Indian.—Rather more was brought forward, *viz.*, 31,500 packag contrasted with 24,000 packages in the previous week and 46,8 packages a year ago.

The improved tone recently noticed was maintained, and althou inferior common did not show any alteration, the grades just abo were taken up more freely at a little recovery from the depress prices ruling a fortnight ago. Competition was also keener for desirable invoices, particularly for several of the closing once

ell-known marks. A few of the Darjeelings were of very attractive character and commanded brisk bidding, notably 115 packages Thurbo Estate for which 2s 3¼d per lb. was obtained, and 67 packages Okayti Co. which sold at 1s 9¼d per lb.

For 28,800 packages on Estate Account 7⅓d per lb. was realised, compared with 8⅜d per lb. for 37,600 packages and 9d per lb. for 3,200 packages in the two former seasons.

CEYLON.—Auctions were larger, comprising 30,100 packages *versus* 19,600 packages on the 20th ultimo, and 31,000 packages twelve months since.

Low class pekoe souchongs and pekoes did not harden in value, but useful parcels were in stronger request and occasionally dearer. Many of the late arrivals possessed better flavour, and were this was the case both home and export buyers were eager to secure pekoes and orange pekoes at enhanced quotations. Broken pekoes with poor cup under 7d per lb. were not so much wanted, but above that figure those with strength and point received increased attention and marked an upward tendency.

Owing to the small proportion of choice lots the average is barely 6½d per lb. On the 21st ultimo it stood at 6⅜d per lb. and 7⅝d per lb. in 1900.

Total printed for public sale during the month:—

1901.	1900.	1899.
107,700 pkgs.	101,000 pkgs.	73,300 pkgs.
(Avge. 6¼d per lb.)	(Avge. 7⅝d per lb.)	(Avge. 8½d per lb.)

Judging by advices and samples lately to hand from Colombo it is satisfactory to notice that finer plucking is being resorted to, and shorter supplies may be looked for in the near future, especially as in some parts the weather was not conducive to heavy flushes.

JAVA.—Somewhat over 3,000 packages passed the hammer, the market being week for common, steady for medium and firm for fine descriptions. About 1,100 packages are advertised for the 7th instant

1901.	1900.	1899.
7,200 pkgs.	2,900 pkgs.	6,100 pkgs.
(Avge. 5¼d per lb.)	(Avge. 6½d per lb.)	(Avge. 7¼d per lb.)

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns are, *viz.*:—

From 1st to 26th February,	1901	... ...	40,002,373 lbs.
Do. do.	1900	... ...	15,968,823 „

During the week the following have been printed for sale by public auction:—

	Sold.	Withdrawn.	Total offered.
	Pkgs.	Pkgs.	Pkgs.
India	29,200	2,323	31,523
Ceylon	28,332	1,794	30,126
Java	1,792	1,250	3,042
Total ...	59,324	5,367	64,691

Also 148 packages from second hands.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon and Java Tea Report, dated March 1st, 1901, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE:

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1900-1901	1,321,821	977,493	45,874
1899-1900	1,384,861	929,567	43,983

31,714 *pkgs.* INDIAN
30,376 „ CEYLON
3,042 „ JAVA
} Total 65,132 packages were offered in public auction this week.

Many signatures have already been obtained for the circular which the Indian and Ceylon Associations sent out with the object of restricting the output of Tea.

In spite of the slight rise which has taken place from the lowest point of the market, prices are still too low to cover anything like cost of production on a large number of estates, and unless the circular be largely signed, there is every reason to believe that the present unsatisfactory position will become still more acute during next season.

Next week's sales are heavier, comprising 42,975 pkgs. Indian and 34,903 of Ceylon.

The quantity of British Grown Tea taken by North America last year showed a slight decrease, *viz.*:—

1900.	1899.	1898.	1897.
Lbs.... ... 16,132,194	16,776,819	13,608,696	11,361,840
1896.	1895.		1894.
Lbs.... ... 9,623,283	7,816,467		4,723,370

If suitable Green or Uncoloured Tea could be manufactured, more progress might be made.

INDIAN TEA.

INDIAN.—Sales this week were again comparatively small, and the slight recovery in prices noticed last week was distinctly more pronounced, common Teas showing a hardening tendency, while useful and fine liquoring descriptions showed a further advance of ¼d to ½d per lb. Several "last of the season" invoices have recently been catalogued.

Week's average of Tea sold on Garden Account 1901, 28,960 pkgs., av. 7·05d. 1900, 37,553 pkgs., av. 8·23d.

Total Tea sold on Garden Account 1st June 1900 to date, 1,097,922 pkgs. av. 7·28d. 1900, 1,084,941 pkgs., av. 8·34d.

CEYLON.—Although the Ceylon auction was rather heavy, the market showed a steadier tone with somewhat brisker competition. Prices of good Teas occasionally advanced about ½d. per lb., while commoner grades showed distinct firmness.

Average for week 6·37d. against 7·60d. in 1900.

Ceylon Tea sold on Garden Account 1st Jan. to date, 223,824 pkgs., av. 6·46d. 1900, 231,990 pkgs., av. 7·59d.

JAVA.—A fairly large quantity was brought forward and was well received by the buyers, competition for all grades being general at prices showing a further improvement on recent rates. 216 packages from Goalpara Estate averaged 8½d. per lb.

Bank Rate 4 per cent. Exchange on London, three months' sight:—Calcutta 1/4 7/32. Colombo 1/4¼.

COCOA.

Auctions on Tuesday presented 8,234 bags, which met a fair demand, about 3,870 bags selling at rather irregular rates. Of 2,183 bags Trinidad catalogued 1,650 bags were placed at fully valuations—71s to 72s for very fine red, and 67s to 69s for middling to fine 1,540 bags Grenada sold out 1,672 bags offered, at 65s to 66s for very fine, 63s 6d to 64s 6d for good to fine, and 62s for common, these figures showing a depreciation of 6d to 1s on the best lots, ordinary qualities being firm. 245 bags Dominica realised 63s 6d for fine, and 62s to 63s for common to good, exhibiting a similar movement to Grenada growth. 93 bags St. Lucia sold at 62s to 64s for common to fine. 70 bags Cuba partly sold at 65s. 32 bags St. Vincent were quitted at 70s for very fine red, and 62s for common. 2 bags wormy Seychelles brought 59s. Of 561 bags African 120 bags sold at 61s for good red, but very small. Of the large supply of 2,345 bags Ceylon catalogued only 160 bags sold, common dull medium and small 60s 6d to 70s 6d, fine small 70s, common to fair small 56s 6d to 62s 6d per cwt. The following were bought in—168 bags Jamaica, 31 bags Venezuelan, 121 bags

Samana, and 707 bags Guayaquil. Private business includes 100 bags Bahia at 64s, 200 bags Guayaquil at 80s to 82s per cwt. for Arriba, and 300 bags Ceylon on secret terms.

PEPPER.

Black.—The market is quiet, with only a small business. On the spot sales of fair Singapore have been made at 6 1/16d, and March-May shipment at 6¼d, at which price about 50 tons have been sold.

At auction on the 27th ultimo 43 bags Alleppy bought in at 6d per lb. also 32 bags Penang character.

White.—Next to nothing done and value is nominal. About 9 3/16d is the value of Singapore February-April shipment and 8 9/16d for Penang.

At public auction on Wednesday 17 cases 121 bags Singapore passed the hammer unsold at 9⅜d to 10½d, as in quality. 10 bags fair brownish Ceylon sold "without reserve" at 8½d per lb.

GINGER.

Cochin.—Is very firm, 36s being the value of fair medium and small washed rough. Catalogues comprised 94 cases 211 bags, of which 95 bags sold at 40s for good plump small to bold washed, partly limed, and 31s per cwt. For ordinary rough, partly shrivelled and limed, medium and small Calicut.

Bengal.—99 bags bold plump bought in at 25s per cwt.

Jamaica.—207 barrels offered and 150 barrels sold as follows:—middling bright washed 40s to 42s 6d, small and medium 37s to 39s, lean dark 34s 6d to 36s per cwt., being steady.

Green.—10 barrels received a bid of 24s per cwt., which is to be submitted.

INDIA RUBBER.

The market for fine Para has shewn continued weakness, with sales of fine hard cure near delivery down to 3s 6¾d, ditto more distant at 3s 7d, ditto old import 3s 9d. Soft cure fine sales at 3s 7¼d, hard entrefine down to 3s 5d. Negroheads lower; scrap pies sold down to 2s 7d and sellers at this price, Cametas at 2s 2¾d Peruvian.—Sales of fine at 3s 6½d, entrefine 3s 4½d, ball 2s 5¾d, an slab at 2s 10½d spot and forward. Considerable supplies wer brought forward to-day in auctions, but demand was very slow an only a small quantity sod at lower prices.

CARDAMOMS.

In slow demand at irregular but unchanged prices for mediu qualities, and dearer for picked. Ceylon-Mysores, fine bold pal selected (1 case), sold at 4s; good medium to bold pale, 2s 11d t 3s 4d; dullish ditto, 2s, 7d; small to medium pale, 2s 5d to 2s 6d medium to bold brownish, 2s 5d; small to medium pale, 1s 8d t 2s; very small, 1s 4d to 1s 6d; specky splits and pickings, 1s 4d t 1s 5d; seeds, 2s 4d to 2s 6d per lb.

CINCHONA.

Two bales of Loxa quill sold at 9½d per lb., and of 30 bales of fla Cartagena 18 sold at 4¾d for damaged. The shipments from Jav for February, amounted to 800,000 Amsterdam lbs.

QUININE.

Dearer. After the close of our last report the second-han market dropped to 1s 1d for spot and 1s 1½d for May, but the open ing of the week saw a considerable improvement, and quotation have gradually advanced to 1s 3¼d, spot (paid), and 1s 3⅞d to 1s 4 for August. Early in the week some of the German makers sol at 1s 2d, and later at 1s 2½d, and on Wednesday the quotation wa officially advanced to 1s 3d for 1,000-oz. lots. To-day factories hav sold at 1s 3d, and refuse to go on at this figure, the second-han market closes strong. "P and G" brand (French make) is quote 1s 2½d. At the auction of quinine in Batavia on Wednesday, 3,50 kilos. of Ed. II. were offered, of which 3,400 kilos. sold at an averag of 20½d kilo., against an average of 19d paid at the auction o December 28.

(Average for all India 7·05d., March 1st).

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first; As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to E. C. DUFF & CO., Proprietors, "Planting Opinion," 106, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Wednesday, the 3rd proximo. Season reports should be sent direct to the Printers, Messrs. HIGGINBOTHAM & Co.

Munzerabad. *March 25th.—Weather*—Sun very powerful in middle of the day, temperature going up to 89° in the shade. Wind from the east by day, and a sea-breeze from the west by night. *Blossom*—There is a nice little blossom out to-day, from the rain of the 16th, and there is every prospect of its setting well; we shall not have large crops but a small profit should be made if the price is over seventy per ton. *Works*—Pruning and manuring. *Health*—Good. *Labour*—Abundant. *Interesting item*—The Volunteer Corps is now beginning to wake up from its crop-time sleep, and notices are going round of drills, etc.

CHANGE OF SEEDS.

CERTAIN remarks made by a writer in the *Revue Agricole* (Réunion) convey a salutary warning to planters who reckon that change of seeds leads of necessity to improvement of strain or of crops. M. P. D'AYGALLIERS asserts that it is almost a general rule in what he terms "our countries" to change the seeds periodically. After the seeds grown on an estate have been employed for sowing purposes for two or three years consecutively, recourse is had to seeds foreign to the estate, which are obtained in the market from quarters the most renowned for seeds of good quality, which are sown in order to renew the strain. He remarks that we might ask if this traditional practice is justifiable, and if it would not be more profitable, in the majority of cases, to allow seeds to produce their own, and that to an indefinite period. He thinks, that that would be much better and that "in our district at least" they would be much benefited by it. M. D'AYGALLIERS argues that the only reason which militates in favor of the change or of the renewal of the seeds, consists in the degeneracy of those that agriculturists collect themselves,

degeneracy that grows worse year after year. But, he asks, why should this unfortunate state of degeneracy be allowed to take place? Could we not avoid it by removing its causes? This appears to him not only possible, but easy as well. He rightly says that we have recourse to new varieties originating from soils and climates differing from those where we place them, it must be naturally expected that these foreign varieties growing under unfavorable conditions would unfortunately degenerate gradually. In order to preserve all these advantages in their cultivation, we would be then obliged to renew the seeds all the oftener, inasmuch as the deterioration would be more rapid, and to fetch them from countries where these varieties enjoy the most favorable conditions. But we cultivate only plants naturalized in our midst for a long time, and local varieties established for a number of years. These besides go to prove clearly that it is not the change of place, not more the result of the soil than that of the climate that can bring about deterioration. When we wish to renew the seeds we do not go to fetch them from different centres. If our seeds degenerate or deteriorate, the only cause to which this can be attributed is to defective cultivating conditions. Now, while powerless to modify the effects of climate and soil, we are perfectly free to modify as we like the procedure and care of cultivation. It will suffice us to bring them to perfection so that we may ourselves obtain strong and sound seeds.

It is apparent from these remarks that the writer's line of reasoning is that a planter should rely rather upon seed carefully cultivated under his own care than upon seed grown by others. A good deal might be said in support of this, but it must be remembered that the careful cultivation of seed makes a heavy call upon the time and attention of planters, and that there must be many instances in which it is better to import seeds from a well-known cultivation rather than devote special care to the raising of one's own. The writer states that it is specially important to set apart specially, for the cultivation of plant-bearing seeds, a piece of land proportionate to the quantity of seeds we wish to obtain. We can thus give to the plants producing seeds for sowing purposes the care which it is not always possible to give to plants of large growth, by way of tilling, weeding, watering, etc. The crop will take place after complete maturity; the thrashing will be carefully done; the seeds thus obtained will be cleaned and picked with care. The picking is an indispensable operation in order to obtain sowing seeds of the soundest quality. It is to the want of sufficient care under this head that the deterioration of seeds in our estates must be solely attributed. They are, in fact, satisfied with cleaning them with a winnowing-machine, which still leaves seeds of good quality, mixed with bad and unsound ones and what is worse, with those of ill-weeds. If after the cleaning of the seeds by the winnowing process, they are allowed to pass through a cellular picker, not only would the bad seeds fall apart, but the good ones also would be separated according to their size into two classes—the first and second quality.

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nicholson's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf people, unable to procure the Ear Drums, may have them free.

Address—No. 989 D, The Nicholson Institute,
Longcott, Gunnersbury,
London.

[w. 26-5-00—26-5-1901.]

It seems needless to say that the seeds of the first qualit alone—bigger and stronger than the others—should b employed for sowing purposes. Even good cultivators, hov ever, have been several times seen to mix up the two qualitie for sowing—thus rendering useless the separation made b the picker. Others again sell the seeds of the first quality sowing only those of the second and thus lose the best advan age that the picking gives them. For a slight immedia profit they compromise the success of their future cro It is only in modifying this system of vitiating the seed and in striving to make a good selection of them by a possible means, that we could ourselves succeed in produ ing sound seeds for sowing. Then alone could we do awa with the practice of going about the market to find suitab seeds for sowing, and for which we generally pay very dea

HYBRIDS OF COFFEE ARABICA-LIBERICA FOUND IN THE ISLAND OF REUNION.

[*From the Revue Agricole.*]

(Specially translated for "Planting Opinion.")

During these recent years, Arabica-Liberica hybri found in India especially[1] have been pretty frequently talke about. Unfortunately, the particulars given on this subje of primary importance have never been complete, and, for m part, I have never been able to read correct information o the two most interesting points of this problem of hybridiz tion of coffee plants: 1*stly* The quality of the berries ob tained. 2*ndly* The amount of resistance offered by th hybrids to the various parasites and to cryptogamic diseases

It is, therefore, with a real pleasure that I have been ab recently to collect some correct informations on these tw points, in examining a very pretty specimen of hybrid ob tained by Mons. Henri Manès.

Mons. H. Manès, who is an intelligent and an indefatigab observer devoting himself passionately to all what concer the improvements applicable to the cultivation of coffee plant had observed, since the year 1896, in his garden at Sai Denis, a coffee plant perceptibly different by the appearanc of its foliage from the ordinary Liberian and Arabian coff plants. This plant had sprung from the seed of a fru collected from the *Coffee-Liberica*.

With its growth, qualities quite peculiar to this youn plant manifested themselves. There was not the least dou that the plant in question was a hybrid. Its growth mig have been operated perhaps by the wind, which may ha carried the pollen of a flower of *Coffee-Arabica* to the stigm of a flower of *Coffee-Liberica;* but it is more probable th this might have been effected by a bee or some other inse

The coffee plant in question is now six years old and almost 3·60 metres high. [3]If not previously informed, an person possessed of the least powers of observation will b

[1] In the district of Coorg.

[2] It is however proper to add that all the Arabica-Liberica hybrids which mention has been made in the reviews referring to Colonial Ag culture, have manifested the remarkable and important feature of nev having been attacked by the *Hemileia Vastatrix* in India as well as Java and Ceylon; and yet some of these hybrids are now eight years o *Vide Bulletin Agricole, Martinique* (May—July, 1899). *Planting Opinio* Madras (10th June, 1899), and *Tropical Agriculturist*, Java, Colom (May, 1899).

[3] The plant would have attained a greater height if the top had n been cut.

t once struck with the entirely peculiar appearance of this lant.

I thought it would be interesting to publish—with the ind permission of my friend Mons. H. Manès—a short ketch of the principal botanical properties of this hybrid, and hen to dwell on the numerous and valuable advantages vhich might result from its propagation.

Beginning with the description of the leaves, I will say hat they are of a medium size between those of *Coffee-Liberica* nd those of *Coffee-Arabica*. They may attain a length and preadth of 21 and 10 centimetres respectively. The leaves f *Coffee-Liberica* are a little longer and generally a little iarrower and the largest of them measure 22 centimetres in ength and 9½ centimetres in breadth. The color of the leaves f the hybrid, like unto that of the leaves of *Coffee-Arabica*, s slightly lighter than that of the leaves of *Coffee-Liberica*. n fine, the free end of the leaf of the hybrid terminates in a harp point like that of the *Coffee-Arabica*. While in the eaf of the *Coffee-Liberica*, this narrowing to a sharp point is ar from being conspicuous.

The flower of the hybrid is exceedingly pretty. Its liameter reaches 48 to 50 millimetres on an average, but it nay even go up to 55 millimetres. It is, consequently, much onger than that of the flower of the *Coffee-Liberica* (36-37 nillimetres on an average, and far greater reason than that f the flower of the *Coffee-Arabica*) 30—32 millimetres.

The Corolla and the Androecium of the flower of the ybrid have most frequently 7 or 8 parts,[1] 1, the type with parts being comparatively rare. It is so also with the Corolla and the Androecium of the flower of the *Coffee-Liberica*; but setting aside this unique property, the flower of he hybrid resembles more closely that of the *Coffee-Arabica* han that of the *Coffee-Liberica*.

The Corolla and the Androecium of the flower of the *Coffee-Arabica* are generally of the Type 5, which must be he standard. The Type 6 is pretty scarce now. As for Type 7, I have not yet been able to ascertain whether it is o be found in the flower of the *Coffee-Arabica*. But it is ertain that should this type exist it must be very rare.

Due allowance being made, the tube of the Corolla nanifests the same development in the flower of the hybrid nd in that of the *Coffee-Arabica*. It is comparatively horter in the flower, more clustered in some way, than in hat of the *Coffee-Arabica*. (*See statement at the end of this rticle.*)

The shape of the petals of the flower of the hybrid is bsolutely similar to that of the petals of the flower of the *Coffee-Arabica*.

The distorted shape of the flower is quite apparent on its petals, and this contorted tendency continues even after the opening of the flower. The petals of the flower of the *Coffee-Liberica* are larger with circular ends.

Let us remark cursorily a minor detail. While the Corolla of the *Coffee-Liberica* gets loose and falls off a short ime after flowering,[2] the Corolla of the hybrid, on the other hand, like that of the *Coffee-Arabica*, stands still for a ong time. For months together, the Corolla of the hybrid, lthough loosened from the ovary, remains hanging, held back by the two branches of the stigma. It then gets dry gradually and loses its color.

[1] The Type with 8 parts is very scarce.

[2] Within 24 hours at the most.

In the hybrid, as in the *Coffee-Arabica* and *Liberica* the stamens and the parts (petals) of the Corolla are equal in number. When the Androecium of the hybrid and that of the *Coffee-Liberica* are formed according to Type 7, we sometimes observe striking irregularities regarding the tendency and the shape of the stamens. What is most frequently observed are two adjoining stamens bending towards each other so as to form a kind of arch and to bring in contact their Anthers which are then united.

Due allowance being made, the stamens of the flowers of the hybrid are absolutely similar to those of the flowers of the *Coffee-Arabica* so far as the relative dimensions of the Filament and the Anther are concerned. For the flower of the hybrid, we have the ratio $\frac{\text{Filament}}{\text{Anther}} = \frac{9\text{ mm}}{11\text{ mm }5}$ and for that of the *Coffee-Arabica* $\frac{\text{Filament}}{\text{Anther}} = \frac{5\text{ mm}}{6\text{ mm }4}$.

These two ratios are equal.

In the flower of the *Coffee-Liberica*, the filament of the stamen is comparatively much shorter with reference to the Anther. ($\frac{\text{Filament}}{\text{Anther}} = \frac{3\text{mm}}{8\text{mm}}$, instead of $\frac{6}{8}$ which would be necessary to correspond with the two foregoing ratios). If, now, we pass on to the examination of the gynœcium, we would ascertain that the ovary, which must, as a rule, possess two cells, possesses only one in half the number of cases. The fruit on attaining maturity contains then only a single round seed.

The following short statement gives full particulars on this point.

Name of Plant.	Fruits with two cells complete.	Fruits with a single seed or round fruits.	Fruits with a single normal seed and a stunted or specked seed.	Empty fruits.
Coffee-Arabica ...	89%	5%	9%	0
Coffee-Liberica ...	76%	9%	7%	6%
Hybrid ...	26%	38%	28%	10%

With Mons. Cornu, the eminent Professor of the Museum of Paris, we have reason to believe that the fecundity will become more and more marked in the succeeding generations obtained by means of successive seedlings. [1]

The style is proportionably more developed in the flower of the hybrid than in those of the *Coffee-Liberica* or *Coffee-Arabica*. A short time after the opening of the flower, it bends itself and the stigma then comes in contact with the stamens.

We come at last to the examination of what is properly called the fruit. In size, it occupies a middle position between that of the *Coffee-Liberica* and that of the *Coffee-Arabica*.

As regards color, the fruit of the hybrid, like that of the *Coffee-Arabica* is of a pretty cherry-red, while the color of the fruit of the *Coffee-Liberica* approaches a yellowish red or vermillion.

If we compare the seeds that have been pulped [2] and deprived of their outer covering or skin, we will see that the seed of the hybrid is still of a medium size between those of the *Coffee-Arabica* and of the *Coffee-Liberica*. There is also some difference in the color. While the seed of the *Coffee-*

[1] Mons. Cornu. The sterility of certain hybrids of coffee plants. (*Revue des Cultures Coloniales*, 5th January, 1900.)

[2] The pulping of the fruits of the hybrid is easily performed.

Liberica is whitish, that of the hybrid, like that of the *Coffee-Arabica*, is of a greenish tint almost approaching the color of dry peas when removed from their pods.[1]

Mons. H. Manès has already brought up seedlings by means of the seeds of his hybrid. As much as can be judged till now by the qualities of the leaves, the young plants thus obtained do not seem to have degenerated.

The germination is produced quite fully on condition that the seeds sown are from fruits entirely ripe, but quite recently collected. It is thus that Mons. H. Manès has obtained 22 germinations from 25 seeds sown by conforming himself to this condition, while he has not been able to obtain a single germination from 150 seeds from fruits collected three months previously.

The young hybrid plants at their origin display very frequently an anomaly in the appearance of foliaceous and cardiform Cotyledons. The latter are so deeply cut or incised; that their general appearance often assumes the shape of three or even four divisions absolutely distinct. This anomaly is much less frequent in the young plants of the *Coffee-Arabica* and *Coffee Liberica* whose two Cotyledons have very often the normal appearance.

I give below a short statement of the comparative dimensions of the principal organs of the three plants as well as a statement of the comparative weights of the fruits.

Comparative sizes of the principal organs.	Coffee-Liberica.	Coffee-Hybrid.	Coffee-Arabica.
Length of the leaf ...	22 c. m.	21 c. m.	14½ c. m.
Breadth of the leaf ...	9½ c. m.	10 c. m.	7 c. m.
Diameter of the Corolla ..	36–37 m. m.	48–50 m. m.	30–32 m. m.
Depth of the Corolla ...	9–10 m. m.	18–20 m. m.	8–9½ m. m.
Large axis of the circle ...	22–25 m. m.	18–20 m. m.	13–14 m. m.
Small axis of the fruit ...	19–20 m. m.	15–16 m. m.	10–11 m. m.

Comparative weight of fruits (per 100 fruits).

Condition of the Fruits.		Coffee-Liberica.	Hybrid.	Coffee-Arabica.
		Grammes.	Grammes.	Grammes.
Full fruits	Fresh	491	261	116
	Dry ...	160	103	45
Dry fruits pulped	Pulp ...	115	68	20
	Seeds ...	45	32	25

In 1899 Mons. Manès having been able to obtain a sufficient quantity of these berries, was in a position to appreciate their taste and flavour. Messrs. Andrè Blay, President of the Chamber of Commerce of the Island of Réunion, A. de Villile, Editor of the "*Revue Agricole de la Réunion*" and I, have had occasion to drink coffee prepared with the berries of the hybrid. Its taste was unanimously found to be very pleasant and in no way comparable to that of the *Coffee-Liberica*. For my part, I found it exquisite and *softer and smoother to the palate*—if I can so express myself—than that of the *Coffee-Arabica*, which always leaves in my mouth a slightly bitter after-taste.

After all, the hybrid in the possession of Mons. H. Manès very closely resembles the *Coffee-Arabica* by t shape of its leaves, of its flowers, of its berries, and—wh is invaluable—by the quality of these last[1]. On the oth hand, this hybrid appears likely to present much great resistance to the various parasites and to cryptogam diseases. Viewing it in this light, it would bear a clos resemblance to the *Coffee-Liberica*.

We have been able to prove that it is not attacked by t *Hemileia vastatrix*, and that its thick leaves struggl triumphantly against the destructive attacks of the larv *Cemiostama Coffiella* and *Gracilaria Coffeifoliella*. In fi the fruit, thanks to its outer covering which is thicker th that of the fruit of the *Coffee-Arabica*, will be better guard against the injuries caused by the caterpillar (*Heliptocer Octoguttalis*).

One can easily understand how invaluable the advantag are and how profitable it would be to propagate this hybr which, while quite as resisting as the *Coffee-Liberica*, produc berries which might be favourably compared with those the *Coffee-Arabica*.

We cannot too highly praise Mons. H. Manès for h intelligent and persevering efforts in the pursuit of obtaini by seedlings, by slips and by graft[2] the largest possib number of plants originating from his hybrid.[3]

[1] When the fruits are dry, the difficulty of removing the seeds of the *Coffee-Liberica* is well known. A regular process of pulping becoming therefore necessary. This inconvenience does not exist with regard to the fruits of the hybrid, which like those of the *Coffee-Arabica* fall off easily from the pulp covering them.

[1] Certain hybrids—much less interesting—would, on the other ha bear a much closer resemblance to the *Coffee-Liberica* than to the *Cof Arabica*. Such is the one of which Mr. A. J Thierry speaks in a w published in the *Bulletin Agricole de la Martinique*. (Nos. 4 and 5, M and July, 1899.)

[2] The two last modes of propagation would be especially important the case where the plants obtained from seedlings would degene too often.

[3] I am indebted to the kindness of Mons. Jacquier, merchant at S Denis (Isle of Reunion) for the illustrations that appear in this article.

NOTES.

Consumption of Coffee in France.

According to official French Statistics, "Special" imports of coffee for consumption in 1900 attained 67,031,500 kilos., as against 65,510,200 kilos. in 1899 and 65,684,700 in 1898.

German Quinine.

The exports of quinine, quinine-preparations, etc., from Germany, for the twelve months ended December were as follows:—

	1900.	1899.	1898.
Kilos	184,800	210,900	2,009,000
Marks	7,022,000	8,014,000	6,630,000

Indian Tea for Indians.

The Provisional Sub-Committee of the Tea Association met on the 19th instant, and formulated a proposal for selling tea retail in India, especially along the railway stations, to fourth-class passengers. In this part of India, "fourth-class passengers" are non-existent.

S. Paolo.

All over this State during the past week, says the *Brazilian Review* of the 12th ultimo, tremendous rainstorms have been general; rivers have overflowed their banks, and large tracts of land have been laid under water. Nevertheless the general belief appears to be that all kinds of cereals are flourishing, and that the coffee crop will be a "bumper."

Quality of Tea and Manure.

Thus the *Ceylon Observer*:—A planter in one of our high districts declares that he attributes his better prices, during the past two years, to having given up the use of artificial manures;—but Mr Mann and other scientists would probably reply either (1) the effect of the said manure has lasted longer than you believe; or else (2) you did not have the proper manure to improve quality!

Java Cinchona.

The N. V. Nederlandsche Veem cinchona-bark department at Amsterdam reports that the shipments from Java to Europe during February, 1901, have amounted to 748,000 Amst. lbs., against 641,000 lbs. for the corresponding period of 1900; 539,000, 1899; 700,000, 1898; 456,000, 1897; 546,000, 1896; 756,000, 1895. The total shipments during January and February have been: 1901, 1,748,000 Amst. lbs.; 1900, 1,256,000; 1899, 1,048,800; 1898, 1,656,000; 1897, 1,516,000; 1896, 1,516,000 Amst. lbs.

The Tea Crisis.

At a meeting of Colombo Estate Agents, held at 11 a.m., on Saturday, March 16th, it was proposed by the Chairman, the Hon'ble Mr. W. H. Figg, seconded by Mr. H. G. Bois, and carried:—"That firms representing local Tea Companies in Ceylon be asked to approach the Directors with a view to calling meetings of their shareholders to consider the advisability of supporting the scheme contained in the circular of the Indian and Ceylon Associations in London, dated 14th February, and also that private proprietors be approached with the same object."

Packet Tea in Canada.

We learn that an important change has taken place in the affairs of two package tea concerns in Canada. It is the amalgamation of the "Blue Ribbon" and the Monsoon Tea Companies. The two brands of tea will hereafter be put up by the Blue Ribbon Company. The names of the brands will not be changed, neither will their characteristics. There are two distinct tastes for tea in Canada, said a member of the Blue Ribbon Co., "one being for thick, rich tea, like 'Blue Ribbon,' the other for a delicate and highly-flavoured tea, like 'Monsoon.' 'Blue Ribbon' will be packed as formerly, while the demand for high flavoured tea will be supplied by 'Monsoon.'"

Public Opinion and Tea.

The *Ceylon Observer* writes with reference to some of our recent remarks:—"Public opinion here is as chary as the legislature in interfering with individual liberty, whereas the latter possession will lead all who are taught wisdom by adversity to us extra care in production which is as needful as, or more important even than, reduction of area. This greater care in production, producing the finer teas the market requires, is now strenuously at work." With due deference to our contemporary, we still hold that public opinion has brought heavy pressure to bear upon tea-planters in India and Ceylon with a view to inducing them to agree to a 10 per cent. reduction of output. Moreover, we believe that some of

* It is understood that the bulk of this tea consists of transhipments for the United States and Canada.

the planters who have accorded their support to this policy have done so solely because of this pressure, not because they believe in the efficacy of the plan itself.

Green Tea Manufacture.

Mr. H. Drummond Deane reports the following as using his machine in Ceylon :—

Brunswick Estate. (2)
C. P. Hayley, Esq.
E. Rosling, Esq. (Chairman, Planters' Association).
Ceylon Tea Plantations Co.
Eastern Produce and Estates Co. (2)
Messrs. Geo. Steuart & Co. (2)
Lipton, Limited.
Carolina Estates.
Darrawella Estate.
Messrs. Finlay, Muir & Co. (2)
Hardenhurst Estate.
Elkadua Estate.
The Hon. J. N. Campbell, M.L.C.
St. Leonard's Estate.
Ratnetenne Estate.
Messrs. Whittall & Co.

The London Tea Market.

Messrs. Gow. Wilson & Stanton's cable of 2nd instant to Colombo reports that demand is strong for fine kinds, and that the market for medium liquoring Pekoes and broken Pekoes is steady ; while the market for common Pekoes and broken Pekoes is also steady. The price of fair liquoring Ceylon Pekoe Souchong is 5d. (same as last week) and the average price of Ceylon tea sold on garden account this week was 6⅝d. (an eighth of a penny up)—as against 6½d. and 7⅝d. respectively in the corresponding week last year. Reuter reports that good liquoring kinds of Ceylon tea are rather dearer. Pekoe Souchongs are quoted at 3¾d. (same as last week) and the average for the week at 6¾d. (a farthing up) as against 7⅛d. quoted for Indian tea. 26,000 packages of Ceylon tea were offered for sale, of which 24,000 were disposed of ; while of the 43,000 packages of Indian tea offered, 38,000 found purchasers.

Colombian and other Coffees.

The Civil War that has been waged in Colombia for the last year and a half bids fair to come to an end soon, and the Government has informed its Agents in England that it hopes soon to be able to declare officially that peace has been restored. This may enable the coffee planters of Colombia to compete more freely with those of other countries. Latest quotations for Colombia coffee range from 80s. to 32s., for Costa Rica from 88s. to 38s., for Guatemala and Salvador from 88s. to 39s. (for foxy green), for Venezuela from 80s. to 35s., and for Maracaibo from 48s. to 32s. London advices of the 8th instant state :—Coffee has met a fair demand, and the better grades of East India have realised full rates ; fine Costa Rica 2s. to 3s. cheaper. "Futures" have been actively dealt in, and after much fluctuation quotations show a reduction of 3d. to 9d. on last Friday's, *viz.*, March 33s. 6d., May 34s., July 34s. 3d., September 34s. 9d., and December 35s. 3d., per cwt.

Cardamom Cultivation.

The *Ceylon Observer* remarks :—For the three districts—Medamahanuwara, Nitre Cave, and Rangalla—we showed 1,891 acres in our last Directory as under cardamoms. A planter, thinking of native gardens, considered we were much below the mark in reference to the first named district, but referred to a well-known resident as the best authority. This gentleman, on being appealed to, dissented, as we expected, from the larg estimate and shows that Mr. de Silva's Kandewatte and sor of the bigger gardens might aggregate 200 acres apart fr very small gardens of other natives. We do not think, ther fore, that there can be now more than 3,000 acres und cardamoms in all the three districts, including native garde Even at 100 lbs. an acre, such an area would yield mo than half the total export from Ceylon for last year whi was 538,000 lbs. Of course, the greater the area alrea planted, the greater the discouragement to extend cultivatio but Ceylon has nearly got to the end of its suitable land, a it is in India that there is a risk of over-doing cardamoms, well as tea, unless planters there take warning in time.

The Colombo Tea Sale Averages for 1900.

A year ago—on the 22nd March when reviewing the averages for 189 we remarked says the *Times Ceylon* :—"It may be that the prices paid during the ye have been comparatively better for low, than for high-gro tea ; but signs are not wanting that the tide is about to fl in the other direction." It followed throughout the year, a at its close had reached a disastrously low point, as the follo ing record of the past ten years shows, gratifying though t total quantity sold may be :—

ANNUAL TOTAL AND AVERAGE.

	lbs.	Cents.
1891	9,578,611 ...	41
1892	11,578,869 ...	41
1893	14,365,017 ...	43
1894	15,723,020 ...	43
1895	19,668,116 ...	47
1896	25,402,624 ...	41
1897	26,512,099 ...	36½
1898	28,847,212 ...	35
1899	32,472,040 ...	38¼
1900	38,442,926 ...	34½

Tea in London.

Cable averages are apt to be m leading, as much must depend up the quality of teas offered, and on this point cablegra usually say nothing. London advices of the 8th ultimo sta —Indian tea ruled firm at the auctions ; common sorts w steady at last week's rates, whilst medium to fine experienc a strong demand, generally at advanced rates, some f Darjeelings and Assams especially realising full prices. T Ceylon tea offered by public sale this week showed a decid improvement in quality, and was accompanied by act buying, and we are able to record a further hardening te dency for most descriptions. Common teas under 4d. per showed no change for the better, and Pekoes from 4d. to 4½ with the exception of those which benefited by the Con nental support, were as cheap as ever, but all medium so ruled rather firmer, and the numerous invoices remarka for point, quality, and strength enjoyed brisk competition distinctly improved values. The catalogues included a go many reprinted teas, which realised most satisfactory advan on the original bids. Continental support was also rat more in evidence.

The Brazil Coffee Crop.

The *Rio News* lately took a ve gloomy view of prospects. Our c temporary wrote on the 15th January last :—"Our advi from Espirito Santo are to the effect that coffee production that state is in a very critical condition, owing to low pri and burdensome taxation. Unless some relief is afforded, industry will soon be almost wholly abandoned. The c

nued rains, accompanied by occasional days of hot sun, is ost favourable for the growing coffee, and a bumper crop is xpected this year. The coffee should be superior in quality lso, for the present weather cannot fail to produce large erries, as well as plenty of them. Unless some unforeseen ccident happens, we shall probably see a record crop this ear. The export duties collected on coffee shipped at the ort of Santos during the past year amounted to 27,002,135 195, or over $5,000,000. This will be an interesting bit of ews to the American Congressman who has been objecting o the imposition of import duties on coffee for fear of spoiling vhat he calls a "free breakfast table." Brazil, however, oes not hesitate to tax his breakfast table, and then refuses o reduce her import duties of American products by way of eciprocity"

offee in London.

With the arrival of two steamers from India a plentiful supply of new rop East India and Mysore has been offered, and it is most atisfactory, says the *Produce Market's Review*, to find that ot only is the crop reported to be a large one, but that the uality of many of the marks is much superior to that received rom the same estates in the last two or three years. The nly drawback is in the size, there being a very small proportion of bold, and a much larger quantity than usual of B size. Prices as compared with previous years are moderate, nd there should be a good demand from the home trade for his growth. Of other coffees only a moderate supply of Costa Rica and other Central American growths has been offering and prices have remained steady, though the bold sizes have not fetched quite such high rates as they did at the opening of the season. In the terminal market there has been a larger trade than for many months and prices, influenced by the American speculations, have been forced up about 2s., a steady advance in the Brazilian exchange having also helped the rise. Even the heavy receipts have not checked the upward movement, and it now looks as if the current crop will turn out ten million bags, while eleven to twelve million is still spoken of for the next crop.

GENERAL ARTICLES.

BRAZILIAN NOTES.

(From the *Brazilian Review.*)

Exchange.—*February 9th*, 1901.—Ninety days' rate on London opened on Monday, the 3rd instant, at 10 5/32 rose to 10 7/16 during the week and closed this evening at 10 1/4d.

The direct cause of this week's upward movement is generally attributed to Pará selling and Bahia offers of repassed paper. Pará seems at length to have absorbed all the bills it required for its own consumption and to be able to supply other markets. At Bahia the stringency of money seems to have prevented bills from being taken up which, with bills from Pará and heavy coffee sales, gave our market more bills than were required. Such appears to be the explanation of the rise although, of course, the usual rumours of a *deus ex-machina* in the shape of a foreign loan to the State of Rio, were not lacking. Declared sales during the week ended 8th February were large, 193,000 as against a weekly average of only 175,000 since the 1st July; and though prices are weaker and the sterling value somewhat less than last year, the monetary stringency is also much more severe and for the present probably more than counteracts depreciation.

Coffee.—Entries at Rio and Santos during the week ended February 8th were 23,552 larger than the previous week's and 68.159 over those of the corresponding week last year. Up to the 8th instant total entries at Rio and Santos exceeded those for the corresponding period of the previous crop by 527,452 bags, and if continued to the end of the season on the same scale will give a total of 9,620,558.

There can be now no doubt that the present crop is much larger than was expected, the lateness of the season having misled the market as regards its true volume. It is also likely that, in view of the heavy early entries expected for next crop, planters are trying to get rid of all their present holdings in anticipation of a new fall of prices.

The weather improved somewhat last week and made transport easier, but in spite of all the tremendous entries at Santos, more than double last year's, are away and above anything that could be expected. Average weekly entries for the current crop are 249,856 bags as against 233,373 for last crop.

Discussion regarding the means to check the fall of coffee prices still goes on in the papers, all kinds of remedies from State monopoly to Dutch auctions being advocated. Nothing however is likely to be done because not only is Government absolutely opposed to any interference beyond a hankering after official assistance in the shape of loans, planters could never be got to agree to anything like concerted action or to stick to it if they did.

JANUARY COFFEE MOVEMENT IN THE U. S.

Last month's deliveries of coffee were large and above the monthly average for the preceding year, says the *American Grocer.* It is apparent that the consumption of the world during the past four months has been on the basis of over 15,000,000 bags per annum, although prior to that time it was much lighter than during the previous year in July, August, and September.

The following statement shows the movement and general position of the article :—

	Bags.	Bags.
Stocks, January 1, 1901—		
United States	1,031,610	
Europe	3,881,735—	4,913,345
Receipts during January—		
United States	345,772	
Europe	817,024—	1,162,796
Total supply, February 1		6,076,141
Less stocks, February 1, 1901—		
United States	797,167	
Europe	3,950,758—	4,747,925
Deliveries, January—		
United States	580,215	
Europe	748,001—	1,328,216
Deliveries, January, 1900 —		
United States	678,862	
Europe	894,227—	1,573,089
Decrease as compared with January, 1900		244,873
Deliveries (United States and Europe), January ...		1,328,216
Do. do. do. December ...		1,180,838
Do. do. do. November ...		1,281,638
Do. do. do. October ...		1,340,059
Do. do. do. September ...		981,198
Do. do. do. August ...		917,608
Do. do. do. July ...		1,219,058
Total for seven months, 1900-1901		8,248,615
Do. do. 1899-1900		9,343,669
Decrease as compared with 1900-1901 ...		1,095,054

The January deliveries in the United States consisted of 488,602 bags of Brazil; 91,613 bags of all other sorts.

The visible supply of the world on February 1, 1901, was 7,217,925 bags, against 7,560,345 bags on January 1 (a decrease of 342,420 bags), and 6,561.767 bags on February 1, 1900.

The visible supply on July 1, 1900, was 5,840,561 bags, so that in seven months it has been increased 1,400,166 bags.

The total receipts at Rio and Santos for the first seven months of the trade year were 7,728,000 bags, against 7,288,000 bags for the same time the previous year, and 6,327.000 bags in 1898-99.

Trading on the New York Coffee Exchange was light, reaching a total of 504,500 bags. Spot coffee, No. 7 Rio, fluctuated between $7\frac{1}{4}$ and $6\frac{7}{8}$ cents. The lowest price for options was 5·25 cents for March; the highest, 6·30 cents for October and December.

BRAZIL COFFEE IN 1900.

(From the *Brazilian Review.*)

Statistics for 12 *months ending December* 31*st.*

	Entries.		
	1st Half-year.	2nd Half-year	Total.
Total entries including all Coffee from States of Minas, Rio, Espirito Santo, S. Paulo, Bahia, etc. received in the Bay of Rio.	1,165,172	1,681,367	2,846,539
Ditto at Santos	1,105,569	5,412,599	6,518.168
Total Entries 1900	2,270,741	7,093,966	9,364,707
„ „ 1899	3,192,084	6,716,135	9,908,219
„ „ 1898	3,320,172	5,553,813	8,873,985
„ „ 1897	2,894,905	7,137,196	10,032,101

Entries at Rio and Santos during the year 1900 were 543,512 bags or 5·5 % less than for the previous year, but 490,822 bags or precisely 5·5 % in excess of those of 1898. The regularity observed by entries during the first and second halves of 1900 at Rio de Janeiro is remarkable, if compared with the enormous difference shown by Santos entries, where those for the second half are nearly five times the first's, although the seasons are the same at both places. This dissimilarity points to some superiority in Rio methods of handling, that enables sales to be spread more uniformly over a longer period. Whether that is the result of the *Ensaccador* (intermediate dealer) system ruling at Rio, or of better banking facilities we will not try to determine, but simply draw attention to the fact to point out that, in spite of the outcry, for money Rio planters can scarcely be in so desperate a condition as is generally represented. . . .

The figures for 1900 are representative of clearances per manifests and thos e for previous years of shipments (embarques) but are close enough for comparison .

Total Shipments from Rio, Santos, Victoria, and Bahia during the past year were 1,065,331 or 10·4% under those of the previou year and 703,578 bags or 7·2 % less than in 1898.

The proportion of Shipments to Entries was however large i 1900, being 97·7% compared with 96·9% in 1899 and only 90% i 1898.

Comparison as regards Rio shipments is not absolutely accurat because in 1900 the system adopted for estimation of shipment was altered, statistics being compiled directly from Manifests an not from the data of *Embarques* supplied by the Dock Company a previously, but the results are sufficiently approximate to admit c comparison.

As to which is the more accurate system there can be no questio Manifests furnishing an absolutely trustworthy record whilst *Em barques* or loadings fail to take account of the coffee cleared, in transit whether by land or sea.

COFFEE SAILED COASTWISE DURING THE YEAR 1900.

From Rio de Janeiro.

Stocks at Rio and Santos were never so large as at present, being 647,436 bags or 79. 2% in excess of those on the 31st December 189 and 505,597 bags or 52.4 % over those on the same date in 1898.

In spite of shipments representing a larger percentage of entries the market is congested with the accumulated surplus of former years which it has proved impossible to work off. In 1900 the quantity shipped was 10.4 % under that of 1899 and 7 % less than in 1898, whilst its f.o.b. value was £ 3,602,294 or 23 % greater than for 1899 and 22.9 % than for 1898, the discrepencies showing indisputably that price is not a mere function of supply and demand but is controlled by other factors as well.

November	466·1	445·3	419·0
December	461·9	428·4	410·2

In October, 1899, just when visible supplies attained their record, a speculative movement was started in European markets that, without apparent justification, succeeded in pushing prices from an average of 5·50 cents in October to 6·88 cents in December of that year. The ascending movement, encouraged by the lateness of the current crop, continued in 1900 *pari passu* with the rise of exchange until it culminated at 9·39 cents in July, when exchange also reached its highest quotation. Exchange then fell violently from 14 1/2d. to 9 7/8d. in August and since then has oscillated about that point. From January to July, 1900, the rise of exchange and of coffee prices was simultaneous; but from August, 1900, onward the uniformity disappeared and, though exchange was steady, prices fell almost uninterruptedly to an average of 7·12 cents in December last.

Looking at the chart showing the average daily course of exchange and of the sterling and currency quotations of coffee during the previous two years 1898 and 1899, the red line representing sterling prices will be seen to be fairly intermediate between the black, representing exchange, and the blue, that stands for currency prices of coffee, until October 1899 when the coffee prices took a big spurt.

From that date until the end of April all regular relation between them seems to have been lost and from January, 1900, exchange, the sterling and currency prices of coffee all rose together. After that sterling prices rose and fell again, but currency quotations followed the general rule and, allowing for alterations in sterling quotations, preserved a more or less inverse relation to exchange.

The periods that claim particular attention are those extending from October to December, 1899, thence to February, and finally to July, 1900. During the second, not only have sterling coffee prices risen simultaneously with exchange, but much more rapidly, whilst currency quotations have surpassed both, and that precisely when, in accordance with the rules of supply and demand, both sterling and currency prices might have been expected to fall. During the months of September and October, visible supplies stood at 400,000 tons and continued in excess of the previous year's until April, 1900. Under such circumstances it is clear that such a rise could only have been produced by the activity of some extraordinary factor quite independent of the relation of supply to demand.

The question has been debated as to whether the rise of coffee prices was the cause or effect of the simultaneous rise of exchange, opinion running rather in favour of the latter hypothesis. A rise of exchange, it was urged, forces up the gold price of coffee and, the supply of bills being thus supplemented, exchange is forced still higher; in fact—perpetual motion.

If the movement of prices be compared with the variations of the "visible supply," no direct relation is observable. Indeed prices seem to fall generally as the supply diminishes and increase when it augments, as occurred in March and April, 1898, and again in May and June and in October, November, and December. In January, February, and March of 1899 as also in May and June to August, but specially September, 1899 to February, 1900, the same contraction is visible, but, from that date to July, the rise in sterling prices seems to have followed more closely the variations of supply.

Prices, however, are controlled not merely by demand or consumption, or, to speak more correctly, by the relation of one to the other. Without following precisely the variations of this relation, it is, therefore, impossible to state positively that the course of prices has not conformed to the rule. There is, however, another factor that powerfully affects prices for the time being and that is speculation, which, foreseeing events perhaps in the far future, may provoke a rise when by all the rules a fall is due, and *vice versâ*. Such is the only explanation of the rise of prices in the last quarter of 1898 just when supplies reached their maximum and a fall might have been anticipated. In fact, the situation had been already discounted by speculation which, looking always forward, was already providing for the contingency of smaller supplies. In 1900 circumstances altered and prices fell, instead of rising, at the close of the year, in view not only of the heavy supply, but prospect of a still heavier crop in 1901.

In contrast to what occurred in 1900 the course of exchange and that of gold prices in 1898 and 1899 were almost invariably inverted, and only during the first three months of 1898 did sterling prices rise or fall regularly with exchange, except very slightly in August of the same year and in April, 1897. The supposition that sterling prices are affected in any way by the mere course of exchange may, consequently, be regarded as absolutely disproven, though as we propose to show later, there are circumstances under which exchange must always prove a powerful factor in the determination of even gold prices.

Still the fact that paper and gold prices did accompany exchange on several occasions shows that the phenomenon is in no way abnormal and, therefore, that there must be factors of a regular nature to account for it.

The rise of sterling prices that commenced in October, 1899, was at first contemporaneous with falling exchange. In November exchange stopped falling and remained almost level until the close of December, when it commenced to rise and only stopped in July, 1900. Apart from other causes there can be no doubt that, in this instance, the improvement in coffee prices and consequent increase in the supply of bills was the cause and not the effect of the rise in exchange. During nearly the whole of July sterling prices continued to rise in spite of the slump in exchange, but in August when exchange had already acquired a stability that still continues, coffee prices, sterling and currency, collapsed ignominiously and appear to be still falling.

The real cause of the rise of sterling prices in October was speculation and that of the fall in August its collapse. The weakness of exchange may have hastened the catastrophe, but sooner or later it was inevitable, because there was little or no *raison d'être* for such a movement.

Summing-up the lessons conveyed by this diagram, it appears that sterling prices are controlled, like everything else, chiefly by the relation of the demand to the supply of the article. Speculation, which is merely an artificial and transitory expansion or restriction of demand, may anticipate events and send prices up or down for a time, but they can only be maintained if justified by a real shrinkage of supply or growth of consumption.

When supply and demand are fairly balanced, alterations of the rate of exchange will influence gold prices and tend to raise them when exchange rises and depress them if it fall, because the local supply being only sufficient to satisfy demand, local prices will be maintained irrespective of foreign markets.

If, however, the supply be greater than the demand, both sterling and local prices must fall more or less uniformly, but as soon as the depreciation reach a point such as to seriously impair entries and the supply of bills, exchange will fall as well and currency prices react and rise instead of falling. This indeed is the critical point of which speculation invariably makes use to push down sterling prices as exchange falls, whilst maintaining uniform or even improving currency quotations. In this way a kind of endless chain is constructed by which the fall of coffee first depresses exchange and is then depressed by the depression: effect and counter-effect. In reality, however, nothing is endless, and as soon as consumption is stimulated to the point of reasserting the lost equilibrium, gold prices rise again, or currency prices are depreciated to such a point as to affect entries, and the balance is re-established by the curtailment of supply. When coffee prices rise and exchange with them the process is merely inverted; but in all and every instance the real and only true factor that determines price is the ultimate relation of the demand to the supply. Heterogeneous as they may appear, all other factors, speculation, exchange, or what not, are all reducible to that.

Although the price of coffee is at bottom the cause and not effect of alterations in the rate of exchange, it has been shown that speculation in exchange may be utilized to enhance the effect of the depreciation of the supply of bills in such a manner as to react upon sterling prices and drive rates down almost indefinitely. Such factors may, however, be combated by others equally artificial, and to speculation under such circumstances, may be opposed such provision as will ensure the supply of bills being sufficiently supplemented at the critical moment and in such a manner as to neutralize the efforts of the enemy.

Such a period we appear to be rapidly approaching when the excess of supply will alone beat coffee prices to the minimum compatible with profit, beyond which they can only be pushed by simultaneous depreciation of the currency. To prevent utter collapse not only in sterling coffee prices but of exchange, it seems indispensable that steps should be taken to ensure a further and very considerable restriction of the currency, or that a large reserve should at once be accumulated abroad to be drawn against at the critical moment, when currency prices have touched bottom, beyond which they cannot be pushed without affecting the supply of the article.

Forewarned is forearmed; but unless something of the kind is attempted, there appears every probability of the close of the year witnessing a slump in both sterling coffee prices and in exchange, that will, perhaps, put things back to a state similar to that of 1897.

CACAO.

POLLINATION AND 10 CWT. PER ACRE.

P. O. D. wrote some little time ago to the Ceylon papers :—Mr. Carruthers, among other things, I believe, is devoting his attention to pollination of cacao flowers, and I have ventured to collect a few ideas on the subject.

If only a tenth of the female flowers that annually appear on a cacao-tree set, 10 cwt. per acre would be common. But there are dangers ahead, and in our endeavours to avoid Scylla it would be well at the same time to have a care of Charybdis.

Thus a tree bearing at the rate of 5 cwt. per acre—and this is surely a low estimate in the event of successful pollination—should yield about 50 average-sized pods per annum. But this is reckoning 300 trees per acre.

It is not probable that the average Ceylon soil will stand the drain of 5 cwt. per acre for very long; therefore systematic manuring is bound to be more or less generally adopted, sooner later. Nor can it be expected, however much it may be hop that so delicate a plant as the chocolate tree has proved itself to will absorb and continue healthfully to assimilate the concentra nourishment of impoverished soil highly impregnated with mulants. Moreover, the best artificial manure for cacao has yet be named.

Ceylon planters have only to look about them to be fully assur of the fact that 20 to 25 years at a remunerative rate of yield, 3 cwt. per acre, and a hundred trees for every hundred-weigh should be the outside life-limit of the cacao-tree. It is useless point to individual trees, whose locality is an open secret, who age may be stated as 30 or 40 years, and whose fecundity is a tonishing. The comparison fails (1) because the individual tree question is not one of a number of others planted at say, 12 fe by 12 feet; (2) because cacao so planted will have been treat far more drastically than the solitary tree which bears so mu ficently; and (3) because, in the case of Forestero (to which the points more especially apply), there is not in the whole island field of any useful extent planted up with only one particul variety. Such trees are altogether exceptional. So that eve twenty to twenty-five years the estate will need to be renewe For canker will help.

Now, the lower a tree, the cheaper the crop-gathering; therefo suckering will continue in vogue. But the tree having been hea ily manured there will be an abundance of "suckers," and th means extra expense. But as the tree will achieve a great sprea this need not be taken into consideration, for these 300 trees p acre will become an impossibility. Probably 150 trees per ac would be nearer the mark.

In order to obtain 5 cwts. per acre from 150 trees, each tree w need to bear 100 pods, and there will probably be no decrease the expense of manure. Being set further apart the trees are like to live longer, however; and this is already a big step in the rig direction.

To qualify this I am personally acquainted (and concerned) wi fields of Forestero cacao whose trees have an average perimeter 25 feet, and they are not yet at their maximum. Let me, therefo suggest that their maximum spread will be 30 feet—a low estima —say, therefore, 50 trees per acre. This indicates that in order obtain 5 cwts. per acre, each and every tree must bear on an ave age of *300 pods per annum*.

But a tree with a perimeter of 25 feet must, of necessity, be so 15 feet to 20 feet in height, and probably much more. The *cost* pollinating, an expensive process at best, now becomes somethi that may be felt. Picking will be dearer, for the trees will be ve tall. Moreover, the cost of seed, and the planting of it is n excessive, so not much will be *saved* by having fewer trees p acre.

Trees planted at 25 feet will find some difficulty at first covering the ground; therefore weeding will become of mo consideration than usual. In order to avoid this, the cacao migh be planted at 12 feet or 15 feet and alternate trees cut out late It is doubtful whether the crop for a year or two will make up f the trees so cut out. There might be two lean years.

Finally, cocoa will drop to 15s. per cwt. through overproductio

Now, the first answer to all this is that there already exist in t Island fields—few indeed!—which give, or recently gave, up to cwt. per acre. But this does not dispose of what may be condemn as a *reductio ed absurdum*, for such fields are of the red variety which planters are becoming more and more shy. Moreover, a attempt at pollination in such fields would be justified only if t owner were willing and prepared to cut out and replant every 15 20 years. Under such circumstances (8 cwt. per acre) even t greediest planter would be inclined, I surmise, to leave well alon

Manifestly, then, there is a point at which pollination as fertile I assume, and apart from the physical capacity of a tree to produ flowers which might set, must cease in order, paradoxically, to b come beneficial. So that pollination is to be welcomed more in re pect of that cacao which is not giving more than two or three cwt. p acre; otherwise the trees will become worn out in a very few yea

Some may say "What though they do become worn? T younger the trees, the larger the pods (the less, therefore, to t cwt.), and the older the trees, the more liable they become to canke Let us plant up afresh two or three years—(and with *graft* cocoa it is hoped this will be possible)—before we cut out eve 20 years, so long as we get our 10 cwt. per acre." Once recogni

the fact that the life of cacao-tree as at present cultivated is as stated, and the answer is obvious.

But if it were possible to obtain 8 cwt. to 10 cwt. per acre without cutting down—if, by means of pollination, a sixth of the trees per acre of a virile and prolific variety of Forestero could be made to bear as well as a Criollo field at 300 trees per acre, can there be any choice as to which of the two methods is to be recommended?

But as there is no fields in the island of only one variety of Forestero, so there is no field of Forestero in the Island which gives—I speak under correction—more than two or three cwt. per acre; and on the top of this comes pollination.

But is there any known jât of cacao—Criollo, Forestero or Calabacillo—which can be depended on for 300 pods per tree per acre per annum?

For purposes of argument I propose to halve this figure: 2½ to 3 cwt. per acre show a very decent profit. There are Forestero fields giving that now, and successful pollination should double and treble this yield.

And the second answer is that cacao, like everything else, is worth precisely what it will fetch in the market. *Verb sap.*

THE AERIAL STEEL ROPE TRAMWAY.

Mr. L. Davidson writes to the *Ceylon Observer*:—

So many enquiries have been made about the Ropeway recently erected from the Plains to the Kanan Devan Hills Produce Company's property in North Travancore that the following notes are penned in the hopes they will interest your readers and answer the enquiries that have been made from time to time.

The first Ropeway line surveyed was about six miles long and the country was very difficult, added to which one span was about 2,700 feet which, as any one acquainted with Ropeways knows, greatly lessens a rope's efficiency because the weight of the rope itself between the standards. 2,700 feet apart, would have been nearly 1½ ton, whereas with the present longest span between of 1,400 feet, the weight of the rope between the standards is about ¾ of a ton and the difference (¾ of a ton) can be carried in line load (*i.e.*, goods) instead of the strength of the installation being expended carrying its own weight. Another disadvantage of this line was that part of it was very flat and part very steep so that there would have been a continual variation of the load on the driving motors when heavy loads left the flatter portions and got on to the steeper ones. The apparent difficulties of this line decided me to try a new trace and it was laid in following pretty closely an old cooly track with the result that we got a line 2·6 miles long at a comparatively even gradient touching a point at the foot of the ghaut to which a railway could conveniently be brought and a point near the top of the ghaut to which a cart road or tramway could be brought and we had then got the skeleton of a complete scheme which has gradually been filled in.

From the end of the old cart road on the plains, a railway trace was laid—10 miles long, 4½ of which ran over the plains and 5½ ran into a narrow valley with grades from one in 80 to one in 25 for the last three miles and curves of 100 feet radius. The bridges are all steel structures running up to 60 feet long and safely capable of carrying narrow-gauge engines and the concession granted by the Indian Government to a Madras Firm (Messrs. Wilson & Co.) for the construction of a narrow gauge railway from Ammanayakanur to Utamapalium includes a branch to the foot of the Ropeway. Fom the top terminus of the Ropeway some 40 miles of cart road and tramways have been cut stretching to Munaar and in various directions therefrom, tapping the Company's estates and factories.

These tramways and roads, the former especially, a Ewing's one-rail tram, may form the subject of a separate monograph; but for the present we will 'return to our muttons' and deal with.

THE ROPEWAY ALONE.

The distance between the upper and lower Termini is 2·6 miles, the difference in elevation 4,000 feet; the steep country is naturally very rough and the lower half a very deadly climate.

The first thing we did was to cut a 5-feet bridle path approximately along the Rope line to transport the material for the Ropeway construction along. Estimates were called for from the most eminent English and local Ropeway Engineers, but not one would undertake *its erection in this deadly* ghaut (which showed their wisdom, as events proved) and an offer was made to the Directors to design, construct and erect the Ropeway locally if they would not hold the worker responsible for any failure, and if they would not protect themselves by engaging a competent Consulting Engineer, and to this they agreed, and the work was placed in the hands of Mr. W. Kemlo, whose great ability and training under Lord Kelvin marked him out for the task. One of first difficulties was how to drive it and the horse-power to be provided (and in this connection the difference in horse-power considered necessary by two great Ropeway Firms was very striking). Another point to be decided was the form of Ropeway, whether of the fixed Rope type, or a moving rope carrying its own loads. After great consideration it was decided that the latter form would be the more suitable, *provided grips could be designed* which would be effective on such a steep Ropeway. Believing that *we* could design what was wanted the plans were prepared

In order to keep the driving station in as healthy a point as practicable we put it half way up the rope, and divided the Ropeway into two halves at this point, the reasons for the latter being: (1) that if a breakdown occurred at any time on one half of the rope, the other one half can still go on working and, (secondly) had the whole 2·6 miles of Ropeway running down 4,000 feet vertical been in one piece, the wear on the rope at the upper end and on the gear there, due to the weight of the rope itself, would have been very excessive.

The next point we decided on was the driving arrangements and as at a convenient point we were able to get in Beeton wheels, having a vertical fall of water operating them of over 700 feet and developing 100 H. P., we fixed this as the Power Station and transmitted the power through a 28 E. H. P. Dynamo one mile over a thin cable to the Centre Station where the motor in its turn operates the Ropeway. By actual results the whole Ropeway requires only about 20 H. P. to drive it, full of loads, at two miles an hour, but of course the power required is greatly regulated by the amount of *up or down loads* at any given time. The dynamo is capable of driving it fully loaded on the *up going side only* at two miles an hour. To save risks of accident we put in duplicated peltons, dynamos and motors.

The erection of the 1,500 feet of pipe and the 1,500 feet of spouting in the watercourse as well as the Peltons, was slow and expensive and was done by Mr. Kemlo's brother. The country is very rugged, and deadly unhealthy, and the spouting as well as much of the pipe had to be carried on iron supports and there were two bridges made for the spouting, one 80 feet long. The Ropewire is ¾ inch diameter best plow steel and was brought out in eight pieces, each 3,000 to 4,000 feet long, wound on a drum. These were all bored for the same axle and the rolls of wire hauled along the track by block and tackle till they came into the Ropeway line where the wheels were fixed and the rope hauled out, the drum revolving on the axle. This was a very neat locally designed arrangement, made at home, and worked perfectly.

Everything comes to him who waits and after much sickness and great trouble, we got the rope up and splices all completed and

PREPARED TO MAKE A START

when the starting resistance sent specially by the providers of the dynamo fused and we had a grand example of pantomime magnesium lights. Part of the current went through Mr. Kemlo's thumb and the place smelt of beefsteaks, while the natives went over that ghaut like another flash.

Mr. Kemlo designed and made with native carpenters a salt and water resistance Box which is working very well and cost a few rupees and that difficulty was got over and the rope started.

You can imagine our disgust and annoyance when we found the rope grips supplied from home so badly made that they would not work, and we had to have new jaws made locally in brass which although not sufficiently strong have worked well and now new jaws of annealed steel are being put in and are working very perfectly.

These jaws, which are the secret of the Rope's success, I will describe later when a patent has been granted. Suffice it to say that they automatically grip the rope at any point desired, go up to the top and automatically leave the rope and run on to the rail. The pulleys on the standard heads have such deep grooves that the rope cannot get off by any chance and the result of this combination of essential points is that the life of the Rope itself is greatly prolonged and probably more than doubled, while, accidents have been reduced till, I believe, 8,000 loads passed over the rope before the last accident, due to a defective pulley and not in any way connected with the grips, and it really did not do any damage to speak of.

The Ropeway *running at half speed two miles an hour* is fully loaded with 66 grips which with loss of time loading and unloading

do three rounds a day. Each load should be two cwts. and this equals 40 tons of out and in traffic a day and assuming that it worked only 250 days in the year this equals 10,000 tons of traffic which is far more than sufficient for present purposes. When it is worked up to 10,000 tons it will certainly show a profit of £10,00 as compared with what it would have cost to move this weight up and down the ghaut by cattle and ponies and donkeys of which we had about 3,000 at work, when the writer came out three years ago. So I think the most captious critic will admit that it is a magnificent success, the greatest credit is due to Mr. W. Kemlo and who has designed and had constructed every detail of it from beginning to finish and to his Assistant.

The automatic working of the Ropeway is very attractive and everyone who has seen it says he or she would not have misseed the sight for a good deal.

KNOWLEDGE OF FERTILIZERS AND MANURES.

The following article, taken from the 1899 Year Book of the Department of Agriculture, relative to the early knowledge and use of artificial fertilizers will be interesting reading. It shows that even in the early days it was necessary to apply artificial fertilizers. The chemical knowledge of the composition and functions of fertilizers at the beginning of the nineteenth century was extremely nebulous. Experience of a wholly empirical nature had shown from the earliest history of agriculture the value of certain refuse products of the stable and the barn-yard in increasing the yield of crops; but the component parts of these materials and the manner in which they acted were entirely unknown. It was the custom in many of the older countries for the farmers to increase the litter of the farm-yard by gathering leaves and twigs, which were used in bedding the animals. As, for instance, it is said of Kliyogg: "He is attentive also to gather all the dried leaves, moss, and rushes from his ground that can serve for litter. A compost dunghill appears to him an object of so great importance to the improvement of land that of all branches of labour he regrets the want of assistance in this the most. In prosecution of this design, in Autumn during the moon's increase, Kliyogg goes into his wood with a hedge bill to prune the supernumerary branches of the fir and pine trees. These he binds into faggots and carries home. At leisure hours, and especially in long Winter evenings he prepares these faggots for the purposes intended. By this method he amasses many many proper materials for good manure." Kliyogg was also careful to preserve the liquid manures which exuded from his stables and for this purpose he constructed trenches in his cow-houses. It is interesting to know that, unwittingly, he had discovered the true function of much of this material, which he regarded as a ferment. The record says: "Thus placed, it receives the urine and dung of his cattle, and being always kept half-full of water; it forms a thick mixture and serves as a ferment, with which a very great quantity of water may in a very short time be converted into liquid manure. One portion of the ferment being mixed with seven portions of the freshest spring water; soon makes the whole become corrupt, especially if the reservoir in which the mixture is made is of wood and placed in a warm situation or if an artificial heat is substituted, in case a natural heat is wanting

By means of this fermentation an excellent manure is produced, which proves the best assistant which can be given to such meadow and arable lands as are naturally dry. The earlier accounts of scientific agriculture at the beginning of the century recognized the great value of gypsum as a fertilizing material. All writers refer favourably to its use. The use of gypsum, as a fertilizer, is said to have been the discovery of Rev. Mr. Meyer, pastor of Kupferzell, Germany. Mr. Meyer published a detail account of the manner of using gypsum. According to the method described by him, gypsum should be spread in its natural state after being reduced to powder, and is useful upon meadows containing both the common and cultivated grasses. Mr. Meyer also found gypsum valuable for peas, vetches, lentiles, oats, rye, and tobacco. Its most surprising effect, however, was upon clover, and this in soils the most dry and arid. On marshy ground it was found to produce no good effect. It is urged that gypsum should be spread upon the grass or grain before it begins to shoot. Upon meadows, the best time for spreading is stated to be at the melting of the snow, and upon fields of grain as soon as they are sown. Benjamin Vaughn the translator of "The Rural Socrates," says that at the end of the last century and at the beginning of the present gypsum was used largely in the United States and he refers to the writings of Judge Peters, Robert Morris, Dr. Mitchell, Mr. Bordley, and others on the subject. The use of marl was also fully understood at the beginning of the century.

Since the time of the Roman conquest and probably before, the marl beds of Northern France and Southern Belgium have been constantly exploited. Great hollows are found in many of the fields of Northern France made by the excavation of marl many centuries ago. Kliyogg calls the marl bed "that mine of the farming gold," and says: "I owe to the marl not only abundant harvest, but the character of my children. It is true that they murmured against me at first for employing them in hard labour, even during the Winter. But at length the rich harvests with which Providence blessed us forced them to confess that I had said nothing which was not both true and useful."

The true function of marl, however, was but little understood and even its chemical composition was practically unknown by those using it. In the article on husbandry, in "The Spectacle Nature," the Prior, in conversation with the Chevalier. says in regard to manure: "This manure which completes what the dew of heaven had begun is the most contemptible substance upon the face of the earth and is chiefly composed of the litter taken from stables and sheepfolds; dove houses, hencoops, and the dwellings of all domesticated animals furnish manures that differ in their degree of heat, and which being blended together, as well as quenched and corrected by each other, replenish the land with all the fertility it had lost." Among other substances which the Prior mentioned as being used for manures, are straw, stubble, shells of pulse, useless leaves, refuse of garden herbage, rotten wood, chimney and oven soot, rags, air of animals, cuttings of leather, skins of beasts, bark of trees, lees of wine, sediments of oil, malt dust, tanners' bark, dyers' lees, soapsuds, of which last it is said, "which are commonly thrown out of the laundry as useless, though soap is impregnated with oil and salts, which are the principal elements of plants."

The Prior also says: "No kind of manure has more prolific qualities than the soil which is swept from populous cities, and especially those where a great number of kitchens and dyers of wool are continually discharging into the streets a fat and oily sediment which is very beneficial to corn."

The value of ashes is fully recognised, in the essay of husbandry by the Prior, who says that they can supply the place of all the rest if a sufficient quantity can be obtained. The ashes of wood are preferred to those of any other substance. He advises the burning of turf for the purpose of securing ashes. The methods of forming composts with ashes are fully described.

The prevailing idea at that time that oil is one of the most valuable of manures is developed in his description, it being stated that "oil and salts constitute the chief merit of manure."

The fact that the principal value of ashes is due to the potash phosphoric acid which they contain was not even suspected by the earlier scientific agriculturists. The early agriculturists in our country were imbued with the customs of their European homes in regard to the use and value of manure, although upon the virgin lands there seemed to be little necessity for the application of fertilizing substances. The necessity of fertilizers, however, soon became evident, especially on lands planted continuously to cereals and to tobacco. When the first abundant crops, due to the virgin fertility of the soil, began to diminish, the colonists received a valuable lesson in the use of artificial fertilizers from Squanto, one of the leading Indians of the new England coast. In Governor Bradford's "History of Plimouth Plantation" is given an account of the early agricultural experiences of the Plimouth colonists. In April, 1621, at the close of the first long dreary Winter, "they (as many as were able) began to plan their corn, in which service Squanto (an Indian), stood them in great stead, showing them both ye manner how to set it, and after how to dress and tend it. Also he tould them, arcepte they got fish and set with it (in these old grounds), it would come to nothing; and he showed them yt in ye middle of Aprill, they should have store enough come up ye brooke by which they begane to build and taught them how to take it."

In George Mourt's Relation; or, Journal of the beginning and proceedings of the English Plantation settled at Plimouth, in New England, by certain English adventurers, both merchants and others," London, 1622, it is said:

"We set the last Spring some twenty acres of Indian corn, and sowed some six acres of barley and pease, and according to the

manner of Indians, we manured our ground with herrings, or other shads, which we have in great abundance and take with great ease at our doors. Our corn did prove well, and, God be praised, we had a good increase of Indian corn, and our barley indifferent good."

Thomas Morton, in his "New England Canaan," London, 1632, wrote of Virginia:

"There is a fish (by some called shads, by some allizers) that at the Spring of the yeare passe up the rivers to spawn in the pond, and are taken in such multitudes in every river that hath a pond, at the end that the inhabitants doung their ground with them. You may see in one township a hundred acres together set with these fish, every acre taking 1,000 of them, and an acre thus addressed will produce and yield so much corn as three acres without fish; and least any Virginea man would infere hereupon that the ground of New England was barren, because they use more fish in setting their corne, I desire them to be remembered, the cause is plaine in Virginea, they have it not to sett. But this practice is only for the Indian maize (which must be set by hands), not for English grain and this is therefore a commodity there."

The following amusing quotation is from the records of the town of Ipswich, Mass., May 11, 1644:

"It is ordered that all the doggs for the space of three weeks from the publishing hereof shall have one legg tyed up, and if such a dogg shall break loose and be found doing harm the owner of the dogg shall pay damage. If a man refuse to tye up his dogg's leg, and hee bee found scraping up fish in a corn field, the owner thereof shall pay twelve pence damage beside whatever damage the dogg doth. But if any fish their house lotts and receive damage by doggs, the owners of these house lotts shall bear the damage themselves."

It is thus seen that even on the old ground cultivated by the Indian before the advent of the colonists it was not possible to raise good crops except by the artificial manuring which has been described above.—*Florida Cultivator.*

GINGER IN LONDON.

A somewhat quieter tone has been ruling in our market this week, which, we confess, says the *London Commercial Record*, has caused some disappointment, as the firmer tendency, and in some cases the inclination to boom, which were evident last week, had raised the hope of a general improvement in the Lane. However, disappointing as the renewed quiet feeling may be to many operators, markets, there is no denying the fact, are still better and more promising than they were some little time ago. There is an absence of that hopeless depression which paralyses all enterprise and effectually destroys all attempts at a revival. Buyers are not keen on purchasing, but on the other side holders and shippers show some determination to maintain values. Spices, above all ginger, form an excellent example of this principle. In spite of a very moderate spot demand, which at other times would be the means of breaking any market, prices are not only fully maintained, but are actually rising, although slowly, and it appears to most people a very extraordinary thing that this sign of strength should fail to attract general attention. No doubt speculative operations in spot lots are not to the taste of everybody, and do not suit the pocket of many would-be buyers, and this may to some extent explain the absence of an appreciable spot demand, but for arrival or delivery terms more interest should be shown in an article possessed of so many possibilities in favour of a buyer. True, the c.i.f. prices asked have generally been over the landed parity, a fact which has deterred most speculators from purchasing lots which, even at the premium demanded at the time, would now show a handsome profit. But the general depression, which then held all minds spell-bound, paralysed the speculative element. Even now, when all reports agree that the crop is going to be a small one, smaller in fact than anticipated, and the non-arrival of new ginger lends a strong colour to these reports, speculators hesitate to invest a small sum in a purchase of it. The result will be that another season will pass without the usual ginger transactions and the annual spurt to which we had become accustomed. Instead of being able to control the market by securing the little that is available, our trade leaves this privilege to the natives who, in case they fail to find purchasers for their crop in India, have no other means of disposing of it than by consignment to London and smash our market the moment it shows signs of recovery. Consignments if they do come will as usual consist of rough and badly cut descriptions; European marks of cuts should therefore gradually increase in value. India, we are told still exhibits exceptional strength; bears and bulls are having a severe fight, and thanks to a strong demand for home consumption and for Arabia, bulls have so far been victorious, and have succeeded in cornering their opponents. The hope of a decline on that side is therefore for the present at any rate destroyed, and as we are steadily approaching the close of the season the probability of doing business is rapidly vanishing. It appears London has ceased to be the controlling market of ginger, it has turned into a speculative and gambling article among native dealers and planters.

GLAZED COFFEE IN OHIO.

The official notice of Dairy and Food Commissioner J. E. Blackburn, of Ohio, that the sale of coffee that had been manipulated by coloring, coating, polishing, or powdering, whereby damage and inferiority are concealed, or whereby it is made to appear better and of greater value than it really is, has, says the *American Grocer*, aroused the trade, and justly. From our latest advices we feel certain that Commissioner Blackburn intends to thoroughly investigate this matter and then notify the trade of the conclusions reached. The following circular has been issued:

Columbus, O., *February* 5, 1901.

Dear Sirs,—Replying to your inquiry about the coffee situation, would say that this matter is now under consideration and investigation by the chemists of this Department. As soon as conclusions are reached, a circular notice will be sent to all the jobbers in Ohio, and a sufficient number will be furnished to supply all their salesmen.

I might say that the following firms have agreed to accept the law as construed by this Department: Andrus, Scofield & Co., Columbus; Dayton Spice Mills, Dayton; and Woolson Spice Company, Toledo. W. F. McLaughlin & Co., of Chicago, have also agreed to comply with the law as soon as construed by the court.

The only firm that has refused, and still refuses to accept the ruling of this Department, or abide by the laws of the State as construed by our Supreme Court, is Arbuckle Brothers, of New York.

Very truly yours,
J. E. Blackburn,
Dairy and Food Commissioner.

Arbuckle Brothers have notified the trade that they guarantee their brands to be a pure food and in strict conformity to the laws of Ohio; facts which they will maintain at their expense in any suit which the Commissioner may bring against any merchant selling their brands.

We have faith that Commissioner Blackburn will take no step to restrict the sale of coffee that meets the requirements of the food laws. The question is rather a difficult one, as the price or market value of coffee is not altogether based on its intrinsic merits in the cup. For instance, a Padang Interior coffee, with less merit in the cup than a Maracaibo, will bring much more in the market on account of the popular prejudice in favour of East India growths. Then the fact that the identity of the raw bean is destroyed in the process of roasting makes it difficult to say that value has been unduly affected by reason of any manipulation of the bean.

In the case of glazing, the primary object is to retain aroma and to facilitate its making, and not to deceive or defraud the consumer.

Unless coffee can be shown to be unwholesome, we can see no justification for interference in its sale under the food laws of any of the States.

FIBRE PLANTS.

"A. P." wrote lately in *Capital*:—

These have been occupying the attention of planters so much during recent years that no apology is required for again reverting to a subject which, according to the ideas of some, is becoming threadbare.

It is difficult to imagine how such a subject can possibly become threadbare or exhausted. Even the fibre plants of India alone would prove an inexhaustible class of economic plants for studious experiment. There are, no doubt, thousands of plants in India which give fibres of sorts. We are informed that there are 300 fibre yielding plants in this country. Of these, we are further informed that at least 100 afford strong and useful fibres, which are regularly

used by the natives of India. Only 30 appear however to be recognised, by Europeans, and those actually utilised for commercial purposes do not appear to exceed ten.

The commerce in fibres is now of great importance, and although some of the new fibres introduced during late years have been of low textile value and chiefly used for adulterating more expensive kinds, a great change has taken place in the quantity produced of all fibres. According to the Cantor Lectures on the subject of commercial fibres the principal vegetable fibres are: Cotton, jute, flax, hemp, of different sorts, paper material (esparto and wood pulp), cordage material, coir and brush material and raffia. This is an exceedingly small list when the available number is taken into consideration. According to Dr. Morris it has been asked whether the general neglect of many really valuable fibres known to exist in many parts of the world arises from some defect in the cultivation, in the want of suitable appliances to extract the fibre, or in the incidents of distribution and commerce.

There are, undoubtedly, many valuable fibres which have hitherto been quite neglected. Even fibres themselves, which have been carefully and exhaustively examined, and proved of great merit, are still unknown in commerce.

It is not the object of the writer in the present instance to bring into prominence all the fibres which are quite as deserving of notice as those already in use. Nor is it intended to even glance at the requirements in cultivation and general treatment (which in some cases are vastly different), of those fibres of real commercial value, which are, by no means, unknown botanically, but, in a great many cases, entirely unknown commercially. A great many of these possess qualities superior to those now in commerce, whilst, to quote Mr. Morris, "their special adaptation for cultivation on a large scale in British possessions in the tropics should bespeak for them the attention they deserve." The writer had the opportunity lately of seeing what is considered the largest sisal plantation in this country which is on the Dauracherra Estate, South Sylhet.

The plants to the number of 10,000 were imported from Florida in 1894, although they had a portion of the consignment sent out from Kew in 1891.

At present about one half of the plants imported from Florida are poling and bearing from 2,000 to 3,000 bulbils (small bulbous plants which grow on the flower stem) each. Large nurseries are being prepared for those bulbils so that in the near future the supply of young plants will be enormous. A few years ago the embargo laid against the export of *Agave rigida* var. *Sisalana* from the Bahamas, and there being practically nonre to be got in this country, was considered by would-be growers to be sufficiently prohibitive to any attempt being made to grow it upon anything like a paying scale in this country. This is all altered now, and it is seen that there will very soon be an ample number of plants for all requirements, and they will be always rapidly increasing. A few years ago this fibre plant was hardly known in this country, and now large landed native proprietors are putting down plantations all over the country, and last year I am informed the Dauracherra Company were unable to supply all the orders received for young plants

The leaves of the sisal plants on the Dauracherra estate had been decorticated, and the fibre has been particularly well reported upon by experts. In one thing the proprietors of Dauracherra have missed themselves in connection with sisal growing, they have made no provision for a permanent crop. The plants have been planted 8 feet between in the row and 10 feet between the rows. These distances have always been recommended hitherto. When the plants got to be about 4 years old a young sucker ought to have been planted in between, so that when a plant poled and died which they almost invariably do within 10 years of planting, the plant which was planted between is ready to take the other's place and keep the constant supply of fibre going.

But after seeing the Daura plantation the writer is convinced that 8′ by 10′ is far too wide apart and would say 4′ by 6′ an ample distance. Whenever a plant has started to give leaf ready to produce fibre, the leaves are constantly cut off just as, or a little before, they come to the horizontal position, and the immature leaves left on the plant are always straight or nearly straight pointing upwards.

The plants, therefore, take up considerably less room than an ordinary sized tea bush and cast no shade whatever. It is difficult to imagine why it was considered necessary to plant so far apart, unless the idea arose when growing a variety of sisal armed with side teeth In this case, if not planted widely apart, they would be difficult to handle and move amongst when leaf cutting. But th right variety of sisal has no side teeth, but only a terminal spin and after the cutting commences this is always pointing upward as already mentioned above, and cannot come in contact with any ou

There is another variety, which is largely grown in Yucata which goes under the name of "Sacqui," (*Agave rigida* va *Longifolia*). Plants of this variety were received at Kew so f back as 1879 and again in 1890. This variety produces equall as valuable a fibre as "Taxqui" (*Agave rigida* variety *Sisalana* Although the variety name of the one is *Sisalana* and the othe *Longifolia* the one has as much right to the name sisal as the othe as they are both grown (it would be stretching a point to say the were cultivated) in Yucatan, and are both shipped at the Yucata port of Sisal, which gives the name to the hemps of both varieti in commerce. *Longifolia*, if anything, is slightly longer in th leaf, as the name indicates, but being armed with side teeth th variety is rejected in favour of the *Sisalana* variety, which much easier to handle and work with But sometime the *Rigid* variety is, less or more, armed with side teeth, but they generall disappear as the plants emerge from this young stage, whic would point to both varieties being fully armed at one tim When Dr. Perrine took his sisal plants from Yucatan to Florid in the thirties he picked the lesser armed variety, not for i superiority of fibre to the *Longifolia* variety, but simply becaus of its smoother leaf. The best fibre districts in Yucatan possess a arid climate with gravelly, stony, or rocky soils, and it is claime that the fibre is stronger and more abundant in dry, hot soi than in rich, deep soils, and the same is found to be the cas in this country. It may be confidently expected that in time th leaves of the sisal plant will lose a great part of their fleshine when grown in this country, as is invariably the case sooner or late with all such plants. But that will be no drawback to its usefu ness as a fibre producer. And as it belongs to a class of plan which is more than any other indifferent to what kind of a soil grows in, it is emiently suitable for planting in poor scrub lan or worn out tea lands. But with all its accommodating qualities will not succeed in every kind of soil. It will not succeed upo stiff clay soil, nor in peaty soils, or in soils which are retentive water. It will grow more luxuriantly and give a longer fibre in good soil than it will in a poor soil. But a soil intended for growin *agaves* for fibre must not be too rich, as in such a case, the fibre wi be of great length, but only at the expense of its strength an quantity And as three feet is of equal value and usefulness i Manila hemp as six feet, the same applies to sisal hemp. The grea desideratum in such hemps being strength and lustre combine with moderate length rather than a long continuance of staple.

PHOSPHATES.

Not only in the Southern States, but also in Tasmania, a rewar either has been, or is proposed to be, offered by the Governmen for the discovery of phosphatic rock. It seems most remarkabl says the *Queensland Agricultural Journal*, that, in a country whe lime, coal, kerosine shale the precious metals, almost, every know mineral, and many precious stones. are found in more or les abundance, as in Australia. no trace of phosphatic rocks has ye been found.

The phosphatic deposits found in such abundance in Carolin U. S. A., in England, and other parts of Europe consist of th fractured and rolled bones of extinct and also of recent giganti sea-animals, such as whales, sharks, sea-lizards, such as th extinct ichthyosaurus, which existed at one time of the world history in millions in our seas and oceans. These fossil bones ar found in enormous quantities on the coasts of Suffolk, Norfol and Essex, and it was not long before the value of the deposi as a manure rich in phosphoric acid was discovered, and the lat Sir John B. Lawes, of Rothamstead, set to work to prepare hi "superphosphate," erroneously known as *coprolite* manure. Many thousands of tons are annually sold, and the demand is still in creasing Some of the deposits are so hard as to require powerfu grinding machinery to reduce them, after which they are dissolve in sulphuric acid to render the phosphate of lime available a manure. In other cases the fossil bones are found in the gree sand, and require very simple grinding machinery and no subse quent process to fit them for agricultural purposes. Phosphori acid occurs in soils principally in combination with lime a phosphate of lime, and this constituent enters largely into th composition of bones, corpolites, and guano and of a variety o

osphatic minerals, such as the Norwegian and Canadian apalite. uracao rock phosphate, the South Carolina phosphate, and others ngland imports some 600.0 0 tons of these minerals yearly, and om Charleston (South Carolina) there are annually exported me 150,000 tons.

We know that the Continent of Australia was at one period of e world's history almost entirely submerged beneath the ocean. ne famous Cloncurry copper-mining district was an island in an ean. At that period vast numbers of huge marine monsters isted in what are now the Pacific, Indian, and Antartic Oceans. an it be possible that the solid remains of these creatures have een completely swept away? This can scarcely be the case, for e know that huge skulls and bones of antediluvian land animals id remains of marine fauna have frequently been disinterred om the black soil banks of various creeks on the Darling Downs. omewhere beneath the surface there must be immense deposits of eir bones, possibly solidified into a rocky mass. At Clifton a one, apparently the leg bone of gigantic prehistoric bird, such as ne Dinornis, was found a few years ago, completely petrified, and me immense thigh bones, also petrified, were picked up in the reek. In the neighbourhood of Chinchilla there are masses of roken bones to be found, amongst which were discovered skulls of ne Australian marsupial tiger in perfect preservation. That nosphatic rocks have not been found is no argument against their xistence, and deposits may yet be found in some portions of the tates not yet visited by scientists.

DISTRICT ASSOCIATIONS.

TRAVANCORE CARDAMOM HILLS.

The following are the Minutes of Proceedings at the Annual eneral Meeting held at Pambanar Bungalow, on 16th March, 901. PRESENT:—Messrs H. M. Knight (*Chairman*), F. issett, E. Latter (*Honorary Secretary*), Attorney for Hon'ble . B. Wilbraham, C. V. Muthusamy Iyer, Ramasamy Chetty, inar Rowther, and (by proxy) Angoor Ninar Rowther.

Minutes of meeting held on 8th October last were taken as read nd confirmed.

Rules which had been printed and circulated were confirmed.

The Honorary Secretary read a letter from Superintendent and istrict Magistrate of Cardamom Hills, dated 15th instant, which was reply to the deputation that waited on the Dewan of Travancore so ng ago as 28th November last,—and stated that H. H.'s Government o not see their way to modify Rule X-A, but have decided to alter ule XIII as follows:—"No transfer of a holding or portion thereof hall be valid unless and until it is ratified by the Superintendent of he Cardamom Hills." Government have also authorised the Amindars of Poopara, Oodumbumshola, and Vandemmettoo to collect st from the Ryots. The question of reducing the rate of assessent to Rs.6¼ instead of Rs.8 is still under consideration and a efinite reply will soon be sent on this point also

The Honorary Secretary was instructed to reply to this letter and equest that kist might be paid to Kombay agent, as originally asked r—and also to press for a reply regarding reduction of assessment Rs.6¼.

The *accounts* audited by Mr. F. Bissett, were duly passed

The *Election of Officers* resulted as follows:—*Committee:* Messrs. . M. Knight (*Chairman*), E. Latter (*Honorary Secretary*), F. Bisett, Angoor Ninar Rowther, and C V. Muthusamy Iyer.

Reduction of Tax.—Proposed by Angoor Ninar Rowther and econded by C. V. Muthusamy Iyer "That H. H. Government be sked to extend the period at Re.1 tax per acre from 4 to 5 years." *arried.*

Resolved that *Subscription* for 1901 to be at the rate of Rs.5 per 00 acres. The five divisions having native representatives to be reated as 500 acres each. This will bring in Rs.210 and with Rs. 50 still due from three of the native divisions will provide sufficient unds for the year and without outstanding liabilities. Members were eminded subscriptions were due at once.

A vote of thanks to the Chairman and Honorary Secretary closed he proceedings.

(Signed) E. LATTER,
Honorary Secretary.

INDIAN TEA ASSOCIATION (LONDON).

The following is an Abstract of the Proceedings of a Meeting of the Committee held on March 5th, 1901, when the following members were present:—Mr. D. Cruickshank (in the Chair), and Messrs. A. Bryans, J. S. Hulbert, Robert Lyell, C. C. McLeod, F. A. Roberts, A. G. Stanton, J. N. Stuart, and C. W. Wallace.

Reduction in Output.—The Secretary reported the number of undertakings received in reply to the circular of the 14th ult. It was decided that reminders should be sent to those companies which had not yet sent in returns.

Green Tea.—The correspondence on this question was read, and after discussion it was agreed that the decision come to on June 21st, 1900, should hold good in respect of the current season, *viz*, "that 1½ annas per lb. up to a maximum of 200,000 lbs. to be manufactured this season, be allowed out of the funds of the levy on the shipments of green tea for the American market, sent there direct from India, such funds to be distributed as a bounty at the discretion of the Calcutta Committee," the definition of the term "green tea" for the receipt of the bounty being taken to be tea made from the ordinary leaf plucked on the Gardens, such as would be ordinarily made into black tea, but which in its altered manufactured state will not compete with the sale of black tea in America or elsewhere. The bounty to be paid on the same quantity as before sanctioned. *viz.*, 200,000 lbs. until it is seen what success is attained in the manufacture of green tea, the Association in Calcutta to be requested to notify the Committee promptly if a larger quantity than 200,000 lbs. is likely to be specially prepared for shipment to America.

Duty on Tea.—The Secretary reported the result of his vist to Sir Seymour King, and it was decided that Mr. J. N. Stuart, should see Sir Seymour, at the earliest opportunity with reference to the letter of March 1 to the Secretary of State for India. It was agreed that a note should be sent to Members of Parliament as soon as the Budget was announced, reminding them of the previous letter to their address and asking them for their support to the proposal for a reduction in the duty.

The Secretary reported having received a call from Mr. G. C. Levey, with reference to a proposed exhibition of products of the British Empire in the winter of 1901 in St. Petersburg. It was noted that Mr. Levey, would write on the subject; and particulars were to be awaited.

THE COST OF WAR.

From the day when Achilles fasted three days and nights over the body of Patroclus, slain in the ten years' siege before the stout walls of Troy, have we learned of war's sorrows.

The Duke of Wellington wept like a child when he surveyed the bloody, hard-won field of Waterloo. Methuen, it is said, broke down at the ghastly sight of Magersfontein, and returned to his tent that the men might not witness his grief.

"Who de d is must be buried," says Homer, and, we might add, "who ill is must die."

So thought Private John Smith, living now at 19, South Uxbridge Street, Burton-on-Trent. The *Aurania* steamed out to the Cape on December 27th, 1899, with this soldier aboard her (that was before she steamed back with the gallant C.I.V.'s) and in telling me of his trials, on August 29th, 1900, Private Smith says that *that* part of his duty was pleasant enough.

"Shortly after Earl Roberts' famous march into Kronstadt, we were stationed between that town and Jacobsdal to guard the line of communication. Towards the end of April I was laid low with that fell disease enteric fever.

"There were hundreds of men down with it It has laid low more men than all the shot and shell that was ever fired by Boer Artillery. For several weeks I was in the fever hospital. My stomach was converted into a manufactory of torturing pains and I grew as weak and helpless as a new-born babe.

"I was for *days unconscious*, but gradually recovered sufficiently to be invalided home"

Yet the suffering of Private Smith was not over. "I went aboard the Hospital Ship *Nineveh* in June," he says, "and

shortly afterwards sailed for home. During my short stay in South Africa, I lost over 20 lbs. in weight. Nothing that I took relieved the constant vomiting, or increased my strength."

"After," he says, "I had been home a few days, my brother, who is an engine-driver on the Midland Railway—not of *an armoured train*—advised me to try Mother Seigel's Syrup. I got a bottle. I found it was doing me good. The vomiting *ceased*, and I was able to enjoy all kinds of food. My appetite is now enormous."

"Altogether I have taken four bottles of Mother Seigel's Syrup, and gladly give you permission to use and publish my statement. This Syrup is a fine tonic and a great medicine for the stomach. I can especially recommend it *to soldiers returning from South Africa* in feeble health."

Wellington knew the bitter cost of war in 1815.

Methuen in 1899 and 1900.

And the hero of this narrative in 1900, too His was a personal cost. "Green vomit." Charles Reade writes, "laid her sickly hand on him."

A broken man.—Until the kindly offices of Seigel's Curative Syrup put him on the steppingstone of "first wealth." which is health.

MARKET REPORT.

[*Per Mail advices of 8th March* 1901.]

COFFEE.

The London Commercial Record says:—The market has been well supplied during the week, and the chief part of the quantity offered found buyers. The batter grades of East India met good competition at full to occasionally dearer rates, but the less desirable qualities are more difficult of sale. Costa Rica has not been in such active demand, and at the close fine qualities are 2s to 3s cheaper, while low middling and middling kinds are dull. Salvador again favored buyers, but otherwise there was no material alteration in other Central American descriptions. "Futures" have shewn many fluctuations; early in the week prices advanced, but lower Foreign markets and Exchange brought about a reduction; the close is, however, firm at a slight advance for the week. Yesterday, May delivery sold at 33s 7½d to 34s 3d. July at 34s to 34s 6d, September at 34s 4½d to 34s 10½d, and December at 34s 9d to 35s 4½d.

Auctions to-day comprised:—17 casks Ceylon Plantation, 826 bags East India, 66 half-bales Mocha, 932 bags Costa Rica, 2,527 bags Guatemala, 220 bags Salvador, 53 bags Caracas, 372 bags Mexican, 26 bags Nicaragua, and 187 bags Santos. A somewhat irregular market. Some Coffee went well and steady, but common Guatemala was 1s per cwt. lower and slow of sale.

TEA.

INDIAN.—An increased quantity was submitted at auction, *viz.*, 5,200 packages, compared with 31,500 packages previously. At his period last year public sales were suspended for a week, uyers being so occupied with Custom House work before the troduction of the Budget as to be unable to attend them.

Chiefly because of the relief afforded to the trade by the ssation of excessive duty payments, there was a good all round emand, common being about steady, while fair to medium, when ossessing cold-weather flavour and strength, were well competed r and in the majority of instances dearer. Fine and finest were request and as a rule marked an advance, among the best results he following are noticeable:—Assam: Budla Beta Estate. BBTCo, 0 packages, 1s 5$\frac{3}{4}$d; Itakhoobe Estate, 113 packages, 1s 4$\frac{1}{2}$d; ealkotee Estate, 261 packages, 1s 3$\frac{1}{2}$d; Suddia Road Co., 121 ackages, 1s 1$\frac{1}{2}$d; Koomtai Estate, 199 packages, 1s 1$\frac{1}{4}$d; Hilika state, AFTCo, 171 packages, 1s 0$\frac{3}{4}$d; and Lattakoojan Estate, TECo, 208 packages, 1s 0$\frac{1}{2}$d per lb. Darjeeling: Margaret's ope Estate, 177 packages, 1s 6$\frac{3}{4}$d; Dooteriah Estate, ATECo, 200 ackages, 1s 5$\frac{1}{4}$d; Badamtam Estate, LeTCo, 186 packages, and alej Estate, ATECo, 103 packages, 1s 3$\frac{1}{2}$d; and Seeyok Estate, 70 ackages, 1s 3$\frac{1}{4}$d per lb.

For 40,000 packages on Estate account 7$\frac{1}{4}$d per lb. was obtained. The London bonded stock on the 28th ultimo was reduced to 3,368,000 lbs., but owing to the rush to clear, which came earlier an in 1900, the statistical position is misleading.

CEYLON.—A larger amount was brought forward totalling 34,500 ackages contrasted with 30,100 packages on the Tuesday before.

Inferior sorts remained depressed, but there was more enquiry for Pekoe Souchongs and Pekoes with brisk infusions, which in some cases fetched considerably enhanced rates while the latter over 8d per lb., and Orange Pekoes were well supported both for home and export requirements. Broken Pekoes under 6d per lb., although shewing unusual value were at times neglected, above that however, there was keen bidding for the most desirable parcels, and a further rise was recorded.

The average is 6$\frac{5}{8}$d lb. On the 28th ultimo it stood at 6$\frac{1}{2}$d per lb.

JAVA.—Nearly 1,200 packages passed the hammer. The lots with useful cup and fine quality went firmly, but less attractive ones were rather difficult to dispose of unless at a slight concession.

For next week 2,500 packages are declared.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns are, *viz.*:—

From 1st to 5th March,	1901	... ...	3,205,292 lbs.
Do. do.	1900	... ...	23,975,042 ,,

During the week the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	41,686	3,553	45,239
Ceylon	31,799	2,657	34,456
Java ...	762	395	1,157
Total	74,247	6,605	80,852

Also 865 packages from second hands.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon and Java Tea Report, dated March 8th, 1901, says :—

Quantity brought to Auction in London from 1st June to date.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1900-1901	1,368,242	1,012,396	47,031
1899-1900 ...	1,384,861	929,567	43,983

46,420 *pkgs.* Indian
34,903 ,, Ceylon
1,157 ,, Java
} Total 82,480 packages were offered in public auction this week.

The gravity of the present position of the Tea producing industry can perhaps be best realised by the appreciation of the fact that the average prices of both Indian and Ceylon Teas are at the present time about 15 per cent. below those at the same date last year, and *that*, in spite of the slight revival in the market rates during the past fortnight

Prices of commonest Teas even now are 40 to 5 per cent. below rates current a year ago.

Indian.—Competition for all descriptions has improved, common kinds selling at steady rates, while all attractive Teas sold at better prices. The official wire gives exports to the U.K. for the second half of February as 1,520,000 lbs. against 400,000 lbs. same month 1900, making a total from 1st April to end of February of 160,830,000 lbs. against 148,492,000 lbs.

Total Tea sold on Garden Account 1st June 1900 to date, 1,137,310 pkgs. av. 7·29d. 1900, 1,084,941 pkgs., av. 8·34d.

Ceylon.—The Ceylon auction was heavy, comprising 34,903 packages. The supply, however, was readily absorbed at firm prices for common Teas, anything with quality again realising slightly higher quotations. Many of the Teas now selling show improvement in quality—this being especially the case with gardens situated in the Dimbula district. The official telegram give exports to U. K. for February as 8,500,000 lbs. against 8,500,000 lbs., making total from 1st January to end of February as 21,000,000 lbs. against 19,000,000 lbs. to the same date last year ; it also estimates the quantity for March as 9 to 9½ millions.

Average for week 6·51d.

Ceylon Tea sold on Garden Account 1st Jan. to date, 257,477 pkgs., av. 6·46d. 1900, 231,990 pkgs.. av. 7·59d.

Java.—In sympathy with other growths, medium and better liquoring Teas sold well, although some of the commoner Teas were withdrawn for higher prices.

Bank Rate 4 per cent. Exchange on London, three months' sight :— Calcutta 1 4 7/32. Colombo 1 4¼.

COCOA.

The comparatively small supply of 4,161 bags offered at auction on Tuesday met a very slow inquiry, only about a fourth part selling under the hammer ; prices were without material cha Of 503 bags Trinidad catalogued, 220 bags sold at steady value good to fine red 67s 6d to 69s. 33 bags Geranada sold with change at 64s for fine red, and 62s 6d for common The gre part of 239 bags Dominica found buyers at 62s to 63s for fai good, being about valuation ; whilst 232 bags Samana were quitted at steady rates, at 61s to 61s 7d. Of 2,381 bags Guayaq 250 bags, mostly sea-damaged, sold at 62s to 68s. 47 bags J partly sold at 25s for low garblings. Of 41 chests 639 bags Cey 170 bags sold—fine bold red 100s 6d, fair medium and small 76s common to ordinary 61s 6d to 67s, and blacks 51s to 56s 6d per c 13 bags Carubano ; 8 bags Colombian, and 25 bags Cuba w withdrawn.

PEPPER.

Black.—The market is very quiet and business is small. On spot sales of fair Singapore have been made at 6 1/16d to 6 1/16d. arrival 100 tons Singapore have been sold, *viz.*, March-May sh ment at 9¼d to 6 29/32d, and May-July at 6 5/16d.

Auctions on Wednesday only offered 8 bags Penang, which s at 5¼d per lb.

White.—Is slow of sale, with business on the spot at 9d for Singapore and at 8½d for Penang. For arrival a little lot Singapore February-April shipment is reported sold at 9d ; Mar May (s.) offers at this price. To-day quiet for Black and Wh with business unimportant.

To arrive 10 tons Tellicherry sold at 6 3/32d per lb. landed Lond per April-May (s.).

160 bags Singapore brought to the hammer on the 6th inst retired at 10¼d per lb.

GINGER.

Nothing offered at auction, and privately sales are restricted small lots of washed Cochin at recent rates.

QUININE.

At the end of last week the market closed easier, with a g business in second hands, mostly for spot delivery. at 1s 2 7/8d oz.; May, 1s 3d to 1s 3⅛d ; June, 1s 3¼d ; and August, 1s 3⅜d. T week opened with sellers at these prices, but on Tuesday the mar was firmer again, 1s 3d being paid for spot, 1s 3⅜d for May, 1s 3 for June, and 1s 3¾d for August ; and on Wednesday 1s 3⅛d w paid for spot, 1s 3⅜d for June, and 1s 3⅝d to 1s 3¾d for Augu Howards advanced their quotation 1d, to 1s 4½d for 1,000-oz. l and 1s 6d in vials. Whiffen's was also advanced 1d. To-day t second hand market has advanced ⅜d, business being done at 1s 3 for spot and 1s 4d for August. B & S are not sellers, and th agents report that 1s 3½d has been refused for this brand ; a that the Amsterdam brand was raised 1s 3½d to-day. P & G quoted 1s 3d.

(Average for all India 7·22d., March 8th).

SUBSCRIPTION. Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first; As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to E. C. DUFF & CO., Proprietors, "Planting Opinion," 106, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 12th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

EXPORTS AND IMPORTS OF TEA BY LAND.

From Accounts relating to the Trade by Land of British India with foreign countries, for the nine months, April to December, 1900, compared with the corresponding period of the years 1898 and 1899 we gather certain statistics that are not uninstructive. For instance, the following list of Exports in the first nine months of the last three years :—

Tea—	1898.	1899.	1900.
Indian—	Rs.	Rs.	Rs.
To Khelat	1,720	2,460	1,210
,, Seistan	...	...	200
,, Kandahar	8,118	11,570	16,067
,, Herat	..	6,680	4,400
,, Kabul	28,212	31,382	64,836
,, Bajaur and Buner ...	53,592	15,876	16,828
,, Kashmir	152,756	221,969	2,45,024
,, Ladakh	21,926	14,786	30,078
,, Thibet	1,570	2,440	3,240
,, Sikkim	5,096	4,324	4,739
,, Nágá and Mishmi Hills ...	...	20	20
,, Manipur	169	151	106
,, N. Shan States ...	...		120
Total ...	2,73,159	3,11,658	3,86,868
Foreign—	Rs.	Rs.	Rs.
To Khelat	4,250	360	...
,, Kandahar	30,234	30,111	8,051
,, Kabul	1,79,225	1,64,649	2,12,580
,, Bajaur and Buner ...	1,81,650	73,905	58,650
,, Kashmir	3,600	780	3,175
,, Ladakh	3,360	700	2,100
,, Thibet	...	...	1,300
,, Sikkim	43	...	...
,, Siam	8	...	68
,, N. Shan States ...	...	...	60
,, S. Shan States ...	4,764	1,854	2,620
,, Karennee	60	...	10
,, Zimme	..	143	
Total ...	4,07,194	2 72,502	2,88,614
Total of Tea ...	6,80,353	5,84,160	6,75,482

Here we have foreign teas not very far behind Indian in a trade that should be peculiarly India's own.

Against the above let us set the following statistics of Imports :—

Tea—	1898.	1899.	1900.
Indian—	Rs.	Rs.	Rs.
From Kandahar ...	1,049	...	...
„ Kashmir	...	40	30
„ Thibet	540	650	285
„ Nepal	29,138	29,299	37,392
Total ...	30,727	29.989	37,707
Foreign—	Rs.	Rs.	Rs.
From Kandahar	...	...	127
„ Thibet ...	...	188	300
„ Nepal	...	...	8,721
„ Sikkim ...	174	...	...
„ Bhutan ...	...	218	202
„ Western China ...	7,257	6,070	46,252
„ N. Shan States ...	4,18,339	4,06,391	4,69.440
„ S. Shan States ...	600	5,168	20,523
„ Karennee	...	130	160
„ Zimmé	2,465	1,185	3,953
Total ...	4,28,835	4,19,350	5,49.678

It appears to us that these figures call for explanation. On the face of them they show an export by land in 1890 of Indian Tea to the value of Rs.386,868, of Foreign Tea to the value of Rs.2,88,614, making a total of Rs.6,75,482, and Imports of Foreign Tea alone to the extent Rs. 5,49,678. Still more curious are the results when we analyse the figures so as to show Imports from and Exports to particular places. Thus :—

	Imports from	Exports to
	Rs.	Rs.
N. Shan States ..	4,69,440 ..	166
S. ..	20,523 ..	2,600
Western China ..	46,252 ..	..

These figures would appear to show that a fair amount of foreign tea finds its way into India—probably mostly in Burma—and that India has no monopoly of the tea trade over the territories just beyond her frontiers.

A little investigation of these figures by the Indian Tea Association would probably be found profitable. It is manifestly to the interest of India that Indian demand for Tea should be fostered and shall be met *solely* by Indian teas. It is equally clear that India will be a gainer if she fosters a trans-frontier trade in India and does her best to get this also confined to the Indian leaf. There are certain peculiarities, it may be, about the tea imported into India from the Shan States and Western China. These should be thoroughly inquired into, and should it be necessary, in order to secure this trade, to make changes in the manufacture or preparation of the Indian leaf, such changes should be made. If Indian tea planters aim at overcoming the competition of foreign teas in European and American markets, much more should they strive to drive out all competitors from Indian markets and from markets that can only be reached *viâ* India. The figures given above are not very large, it is true, but "every little helps," and if trade near at hand is neglected we can scarcely hope that the tea industry in India will recover from the present crisis as quickly as it might do were every effort made to stimulate consumption, and to meet it, in all possible quarters.

BOARD OF TRADE RETURNS.

February, 1901.

Officials tables of Imports, Consumption, and Exports various articles for the two months Feb. 28 in the prese and two previous years, compiled from the Board of Tra Returns, with stock in U. K. on Feb. 28 give the usu information concerning the chief products in which o readers are interested.

Coffee.—A large increase in imports is almost exact balanced by an increase in Home Consumption, but expo have shrunk and stocks swelled.

—		1899	1900.	1901.
Import ...	cwts.	125,834	135,021	159,743
Home Consumption	„	45,644	63,832	79,093
Export	„	78,149	93,875	65,602
Stock	„	304,000	294,000	335,000

Cocoa (Raw).—Here the expansion of Consumption h been much greater than that of Imports, and shows in tv years an increase of nearly 100 per cent. Stocks a moderate :—

—		1899.	1900.	1901.
Imported ...	lbs.	7,133,609	10,413,620	10,363,44
Home Consumption	„	6,730,705	7,687,112	12,353,87
Export	„	2,471,090	1,791,133	1,706,06
Stock	„	15,197,000	13,637,000	13,254,00

Cocoa (Prepared).—Similar healthy development is notic able here, and stocks are decidedly small, amounting to litt more than the average consumption in two months.

—		1899.	1900.	1901.
Imported ...	lbs.	897,407	1,074,977	1,387,573
Home Consumption	„	979,785	1,051,297	1,342,060
Export	„	208,038	146,808	137,130
Stock	„	976,000	181,000	230,000

Tea.—Imports have increased since 1899 by nearly per cent., consumption has nearly doubled, and Exports ha increased. Yet stocks, also, are larger, and represent som thing like 15 months' requirements.

—		1899.	1900.	1901.
Import ...	lbs.	41,924,065	56,676,270	60,956,827
Home Consumption	„	38,900,097	59,953,108	77,669,188
Export... ...	„	5,385,115	5,253,441	7,436,855
Stock	„	95,093,000	102,308,000	97,479,000

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nich son's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf peop unable to procure the Ear Drums, may have them free.

Address—No. 989 D, The Nicholson Institute,
Longcott, Gunnersbury
[w. 26-5-00—26-5-1901.] *Lond*

EXPERIMENTAL TOBACCO CULTIVATION IN QUEENSLAND.

Mr. R. S. Nevill, Tobacco Expert in Queensland, states his report upon work done during the year ending 0th June, 1900, that the crop mentioned in his last report being in the farmers' hands has been marketed, and brought the growers some £20,000. The crop now in the hands of e growers is not so large, by reason of continued drought uring the transplanting season, and the prevalence of blue ould throughout the tobacco-growing districts of Texas and nglewood, causing great destruction of plants. So far, his xperiments with fungicides as a cure for blue mould have ot been satisfactory. He has not yet tried them as preven-ves. Other experiments have given better results, but have ot yet been sufficiently tried to be regarded as beyond the xperimental stage. Conditions under which blue mould revails are well known, and the most satisfactory experi-ents have been to neutralise these conditions as much as ossible by the day, and ceasing to water as much as possible, llowing the beds to be as dry as is consistent with plant fe ; when water is used, to have it as near the temperature f the plants as possible, to prevent chilling. In future, says Ir. Nevill, we shall probably supplement this treatment with our of sulphur, sprinkled over the beds, when the plants rst appear. The experimental crop of 4 acres, grown in exas, has given satisfactory results, producing about 2½ tons f good, well-cured leaf, of good quality, and much of it very esirable for wrappers.

The growers are continuing to manifest an interest in the nprovement of their product, and the plough is fast being ubstituted for the hoe in cultivation. The proposed experi-ental farm is looked forward to try them with much inter-st. This farm will be centrally located, and convenient to ll the growers. The consumption of locally-grown leaf is aking satisfactory progress, showing an increase in the past welve months of 77,571 lbs. over the preceding year ; while he increase of imported manufactured tobacco shows only 7,000 lbs. The import of raw leaf is merely nominal. Mr. Brunnich made a comparative analysis of American and Queensland grown leaf of similar varieties. The Queens-and-grown leaf compares favourably with the other, and Mr. Nevill believes that the slight defects may be largely vercome by proper curing and manipulation. Local manu-actures are, he says, using every effort to popularise the ome-grown tobacco, and are taking great pains to get the est results from the leaf. In the Cairns District a few small xperimental crops have been grown and enquiry has been ade by manufacturers for samples. Two samples of cigar obacco were received from the district between Mackay and t. Lawrence, and which were very good indeed.

U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

At the monthly meeting of the Committee of the Blantyre Chamber of Agriculture and Commerce, B.C.A., held in Chamber Offices on the 6th February, 1901, Mr. Beaton, President, in the Chair ; the Secretary submitted a commu-nication from the United Planters' Association of Southern India, Madras, sending a copy of a resolution on the advisi-bility of a movement in favour of an Imperial Fiscal Federation for the protection of British trade interests as against those of the rest of the world. The resolution was the result of the recent revision of the French Tariff in regard to imports of produce from *inter alia*, India, and the British Colonies and dependencies with the exception of Canada. This tariff may not be enforced, as it was really directed against Brazil, who has made up its quarrel with France, yet the circumstance served as a warning of the risk to which British trade is exposed. The Committee agreed to support the Association in any measures which they adopt in the matter.

Mr Stark moved "That, in view of the recent Custom Convention of South Africa, treating British Central Africa as without the Customs Union, the Chamber of Agriculture and Commerce take the matter up strenuously and write at once to the Governor of Natal, with a Copy to the Chief of Customs craving that produce such as coffee and tobacco from B. C. A. should be admitted into South Africa on the same basis as similar imports from countries included under the Convention." In supporting the motion Mr. Stark said that under the Convention tobacco, for instance, was liable to an import duty of 2/- per lb. on unstemmed leaf, and 2/6 per lb. on stemmed leaf. British Central Africa was, in this respect, taxed to the same extent as Brazil and America, and it was pretty severe on B. C. A. to be on the same footing as these countries. A suitable market could be obtained for coffee and tobacco in South Africa. Its proximity to B. C. A. would be most beneficial to the Planting Community of the Protectorate in every way. The attention of Planters had recently been drawn to the growing of tobacco here, and he believed a profitable industry would be assured if the markets of South Africa were accessible to produce fron B. C. A. and closer reciprocal business relations between the Merchants of South Africa and Planters, would probably follow as a matter of course. Mr. Hamilton seconded the motion.

The Chairman suggested that a Sub-Committee be appointed to deal with the matter and Mr. Cox moved the appointment of Mr. Stark and Mr. Hamilton, which Mr. Metcalfe seconded. The meeting decided to send to copy of the resolution to H. M. Acting Commissioner.

COFFEE IN DISTANT LANDS.

XXV.

Queensland.—The *Queensland Agricultural Journal* gives the following paper, headed "Coffee Culture in Queensland, No. 5—Disbudding," from the pen of Mr. H. O. Newport :—On my arrival in this State, and after seeing the coffee estates and conversing with the growers, I was frequently asked to explain what was the matter with some patches of coffee which the owners considered sick. In some places the unusual and obviously unnatural shape and condition of the trees were put down to some new form of coffee disease The theories were numerous regarding these alarming symptoms, and more than one tree was dug out to see if anything unusual could be found in its root growth.

The trees were long and thin, some 8 to 10 feet high ; they had a good lower part, consisting of from six to eight pairs of primaries well covered with wood, and an apparently healthy tuft of green branches at the top. but the middle of the stem was, for 2 or 3 feet, either woefully naked or sparsely covered with a bristling assortment of dead primaries. The middle

branches had died out, I was informed, and nothing could be found wrong with the roots by anyone. This unfortunate state of the trees was due to no disease, but purely to natural causes. It was not experienced in other countries because coffee is, firstly, not allowed to get into such a state, and, secondly, would not generally do so except under very favourable conditions of growth. The reason of this dying back of the apparently middle primaries began in or about the third year of the plant's growth, when the first crop was borne. Coffee not bearing for the first three years or so, the lower six or eight primaries were enabled to make secondary growth as well as to mature and establish themselves, while the upper primaries had not generally done either by the time of the first blossom making its appearance. The tree blossoming heavily all over—too heavily, in fact owing to the rich soil and forcing climate—the lower primaries blossomed all through, with their secondaries to a certain extent also. The upper primaries blossomed to their very tips as far as they were old enough to bear, and at the extreme top of the tree a pair or two of young primaries, only an inch or two long, were not old enough to do anything. In the course of producing and ripening the fruits from this blossom, the lower branches, owing to their maturity, age, and support from secondaries, were able to do so satisfactorily. The very little primaries at the extreme top, having no crop, drew their share of sap and continued to grow ; but the upper primaries of the young tree had not only to support themselves, but bear and ripen their crop as well, and, bearing over every inch of their length, they were unable to meet this demand upon them.

Their share of sap was absorbed in filling the berries. In some instances they managed to ripen their crop and then died ; in some they only ripened the crop on the matured portion of their length ; in others the tips of the primaries died back. In some instances the effect was greater, in some less ; but the result was in all cases that they bore their progeny at the expense of their own constitutions, and often at the cost of their very lives. When they lived it was as whippy, long, thin sticks that were bark-bound and entirely without secondary growth upon them ; and the young primaries just above, that were too young to blossom, together with a few more that grew in the course of the year, soon outgrew the bearing ones in length and girth. In this way a gap was at once established of from 1 to 2 feet. The next year much the same thing happened again, the result being a widening of the gap, and resulted a growth of tree not only unsightly and useless, but at the mercy of wind and weather.

Trees that were topped in time did not suffer to the same extent. In demonstrating this point in the field, I seldom had any difficulty in finding examples to hand of trees in various stages of this form of over-bearing, and I would suggest to coffee-growing readers to look carefully round their estates and notice any such tendency.

This is a matter easily remedied if taken in time, but if in a well-protected locality is very apt to be unnoticed until the damage is done. The remedy for this state of the tree is to cut the stem right back to the top of the healthy primaries—a place generally seen at a glance—for the upper part is of no use, and a new sucker can be raised from the stem, which, if topped in due time at the right height, will, in a few years, bring the tree into shape again. Topping back a young tree boldly, even down to 3 feet or so, when any tendency to become bark-bound in the upper primaries is observed, will also often save it, but prevention is better than cure.

To prevent the above-mentioned state of affairs it is nece sary to disbud. The disbudding should be done by pulling rubbing off the very young beans a week to three weeks (n more than a month) after the blossoming. It is of no u rubbing off the flower-buds, as at that time the tree is in state of conception, and the effect is merely to force out succession of buds in the same eyes ; nor is it any advanta to wait until the berries are half or partly grown, nor, as son suggest, to wait until the tree shows, by turning sickly yellow, that it cannot carry the crop, for by that time th harm is mosly done.

Disbudding is only necessary from primaries, and the gree or immature part of those, which is usually about half the length. The mature wood is able to carry its crop witho detriment. As a matter of fact, the green tip of the youn primary should not be allowed to put out secondaries eithe Disbudding, again is, a rule, only necessary once in the li of a coffee-plant, and is not an annual work, for, once th primaries have secondaries to support them and to draw sa over-bearing on the green end of the primaries seldom occur

Generally it is in the third year of the plant's life that th is required, but occasionally a little attention may be nece sary in the second year, and sometimes in the fourth, but seldo more than on the one occasion.

Disbudding is required from the primaries whenever, an only when, they attempt to bear on immature or green woo It is not necessary if the primary has secondaries upon it, an it is not necessary to disbud secondaries or any other for of branch.

A secondary or tertiary can be replaced from the same ey if by any chance it should die from over-bearing (which ver seldom happens), but a primary never.

This disbudding may perhaps be considered an expensiv work because of the time it takes to do, but as I have alread said, it has only to be done once (as a rule) in the life of plant, and the labour is very soon repaid by the subsequen cropping of the tree. One are two growers objected to the ap parent loss of crop occasioned by the pulling off of the berrie on the green tips as advocated by me, but I regret to sa that their estates suffered considerably in consequence, an no advantage was gained, as the primaries were not onl unable to ripen any crop on the tips and died back but di not even fill out the crop properly on the matured portion their primaries.

The disadvantages of not disbudding have been ampl shown, I think. The necessity and advantages of disbuddin lie in an increase instead of in a decrease of crop in takin the first two crops together, because of the secondaries tha the disbudding encourages and which come into bearing i the second year, and the production of sturdy and health trees that bear an even crop annually indeed, the value the crop removed as well as the cost of removing it is ofte paid for in the first year by the size, weight, and density the crop left on, which otherwise often does not ripen at al

Reference to this matter is seldom found in any books writers on coffee culture, because in most countries it is no necessary, or so seldom happens as not to be considere generally necessary ; but here, in Queensland the ver favourable conditions for the culture of the staple migh prove the very cause of its undoing.

It has been the cause in so many instances of failures, rather, perhaps, the want of success of coffee-growers in thi colony, that I am of opinion that it is worthy of special not

NOTES.

e Colombo Tea Market.

The sale on 27th March passed off with active competition at firm rates, rticularly for good liquoring sorts.

rnando Po.

A report on the Trade of Spain for the year 1899 says :—"The imports m Fernando Po included 1,000 tons of cocoa valued at arly 1,000,000 pesetas (£40,000) and considerable quan- s of coffee and fire woods.

ulteration.

The Arbuckle Brothers' Coffee Company has filed a suit in the nited States Court to enjoin State Food and Dairy mmissioner Blackburn, of Ohio, from prosecuting it or its ents for violation of the Ohio food laws.

a Coming into Bearing n India.

A "Lowcountry Proprietor" in Ceylon writes with reference to new tea land coming into bearing in India: would "prevent this land coming in" by continuing the avy cropping generally which has caused trouble during the st year. But all have already begun to pluck fine.

calyptus-distilling.

According to the report of the Chief Inspector of Distilleries in uth Australia, there are fourteen eucalyptus-oil distilling ences in force in that colony. Thirteen licences are on angaroo Island, the other at Punyelroo. The value of oil ported increased from 1,131*l.* in 1892 to 2,224*l.* in 1899.

Lucia.

A Colonial Office report on the trade of St. Lucia for 1899 states at the cultivation of kola, turmeric, annatto, ginger, vanilla, dia-rubber, and musk-seed is still carried on, but to what tent is not stated. The price of kola, however, is not fficiently remunerative to warrant new plantations of this oduct being put in.

ain.

During 1899 Spanish imports of coffee and cocoa were as follows :—

	£
Coffee	509,000
Cocoa	907,000

a is included with 'groceries' in official statistics, so no formation is available as to Spanish imports of this com- odity.

ylon Tea in Germany, Austria and France.

Mr. Renton's reports show that Ceylon tea is being gradually pushed in these countries. In France, more rticularly, he thinks he has a hard fight before him, not much against China tea, but against coffee. This has own cheaper quite as rapidly as tea, and to have to persuade ople to drink more tea and less coffee is to attempt to ange the taste of nations.

vernment and the Planter.

With reference to the suggested appointment of a Scientific Expert to study agricultural matters in British ntral Africa, the Secretary of State has expressed the inion that the expenses of an enquiry of this nature, which designed immediately to benefit planters in the country, ight very well be undertaken by some co-operative effort on e part of the planters and firms directly concerned.

Shipments of Teas from Canada.

Some Japan teas have been picked up at points in Canada during the last few weeks and shipped to the United States, says the *Canadian Grocer*. Stocks of Japan tea held here were not generally large, although one shipping house had quite a quantity in store, which has for some time tended to keep values down on this market. A few young Hysons have also been shipped from here to Great Britain. We also hear of shipments being made from New York.

Coffee in London.

Cable advices quote prices as follows, the market being flat :—

Coorg Plantation (B. size)	...	...	42s. to 70s.
Nilgiri do.	do.	...	44s. to 50s.
Wynaad do.	do.	...	43s. to 55s.
Mysore do.	do.	...	39s. to 70s.

Good average Santos is quoted at 31s. 6d. a shilling more for futures (September delivery).

Madagascar Vanilla.

The *Politique Coloniale* states that although Madagascar produces as yet only a comparatively small quantitity of vanilla, a noteworthy increase is shown by the Customs returns for the last three years. The exports, which in 1890 were only 30 kilos. (66 lbs.), rose in 1896 to 1,050 kilos. (2,310 lbs.), and to 3,724 kilos. (8,192 lbs.) in 1898. As regards the preparation of the product, the Creole colony of the east coast of Madagascar has for many years contained skilled workers, natives of Bourbon and Mauritius, who willingly take charge of the drying of the pods.

Entomology.

After many years of hard work and industrious research, Miss Eleanor A. Ormerod, the well-known Entomologist, has decided to discontinue the annual reports on injurious insects and common farm pests which she has prepared for a period now extending to close upon a quarter of a century. When in the year 1877 she issued the first of these annual records, very little systematic work had been done in the direction of saving crops and live stock from the ravages of insect and other pests. Now, this class of work has been reduced to a system, much to the advantage of agriculturists.

A Seed-testing Station.

The Board of Agriculture Departmental Committee presided over by the Earl of Onslow, to inquire into the conditions under which agricultural seeds are at present sold, has come to the conclusion that the seed trade in England is on the whole, well conducted and has of late years improved with the advance of science. Nevertheless the majority of the Committee recommend that one central station should be provided in the United Kingdom for the purpose of testing the purity and germinating power of seeds sent to it for official examination. Two members of the Departmental Committee dissented from this decision.

The Pistachio.

The pistachio tree, *Pistachio vera*, the species which yields the eatable pistachio nuts of commerce, is deciduous, growing about 20 ft. high, and a native of Western Asia. It is largely cultivated throughout Southern Europe. Its fruits are oval-shaped, nearly an inch long, and contain a seed with bright-green cotyledons. The nuts are largely eaten by the Turks and Greeks, and also by the people of Southern Europe, either simply dried like almonds, or made into articles of con-

fectionery. Baron Von Mueller, in his list of plants for industrial culture, refers to an ingenious method of inserting the pistachio seeds into dry figs, to secure their power of germination during transmission to remote places.

Another Blow for the Tea Industry.

The *Ceylon Observer*, of the 27th ultimo, remarks :—News comes from Australia to-day that the nominal duty of 1d. per pound on tea entering New South Wales will, by the Federal tariff, very probably be raised to 3d. ! We trust in view of the still possible raising of the tea duty at home that this fresh blow to Ceylon teas—which recent reports have steadily stated to be in fine demand and clearing well with each importation—may be averted. The effect would be different from that of a raising of the home duty in that it would probably stamp out China teas from Australia altogether ; but as the imports of China there have of late been so immensely reduced, Ceylon would receive no comparative advantage to compensate for the extra cost of production imposed on the growers.

Java Cinchona Bark.

The *Straits Times* observes :—Cinchona planters in Java have thrown off the yoke of a German ring of dealers, who had combined to keep the price of bark down for the enrichment of quinine manufacturers. They have started a quinine factory of their own at Bandong in Java, and arranged to sell their quinine at Batavia by auction. The German monopolists have threatened to start a rival quinine factory in Java. A German quinine manufacturing firm intends to carry the war into the enemy's country in a different way. It proposes to sell quinine pills in Java,—that is, quinine prepared for direct consumption,—at a price corresponding with that of Bandong quinine at the Batavia auctions. The firm will certainly suffer loss by this, but the Bandong factory will have also to stop the making of quinine pills, and will thus lose a main source of profit.

Tea in Cannon Shells.

C. E. Colson & Son are, says the *Canadian Grocer*, just placing on the Canadian market, through the wholesale houses, a novel 1-lb. package of high-class Indian and Ceylon tea that the few retailers who have already seen it pronounce to be a good seller. The package is made of tin formed into the shape of a shell, being a facsimile representation of cannon shells used by the British artillery in the Transvaal War. It appeals to the military spirit now so dominant in the Empire. In England, it has sold phenomenally well. The packing is done by the British and Bennington's Tea Trading Association, Limited, packers of the "Blue Cross" tea. The tea itself is a high-grade article, retailing probably at about 50 or 55c. The tin, apart from its novel appearance, is commendable for use in such a package, as it preserves the tea in a fresh condition.

Drying of Plants.

M. Mansier has been giving in the *Centre Médical et Pharmaceutique* some advice on the drying of plants, not for medicinal purposes, but from a botanist's point of view. He points out that many plants contain in their leaves or their flowers a chromogen, and it is necessary to avoid a too rapid evaporation of the juices, which causes a destruction of the cells ; otherwise, under the influence of oxygen a coloured substance will be produced, which will rob the plant of its natural tint. After making various experiments, he decided that the dryi should not be done by heat, but solely by current of dry at a temperature of 12° to 15°. The freshly gathered pla should be spread in shallow layers on hurdles or suspended little bunches. By this means the natural beauties of plant are said to be preserved. The drying should be carr on until moisture is no longer lost.

The London Tea Market.

Cabling to Colombo on the 2 ultimo, Messrs. Gow, Wilson Stanton reported that the market generally showed a fr tional advance, and that good liquoring Pekoes were improving demand ; while the market for common Pek and broken Pekoes was steady. The price of fair liquori Ceylon Pekoe Souchong was 5¼d (¼d up) and the avera price of Ceylon tea sold on garden account during the w was 7⅛d (½d up)—as against 6¼d and 7⅜d respectively in corresponding week last year. Reuter reports that the t of Ceylon tea is generally firm Pekoe Souchongs are quo at 4d (a farthing up) and the average for the week at (also a farthing up) as against 7⅛d quoted for Indian 25,000 packages of Ceylon tea were offered for sale, of wh 24,000 were disposed of ; while of the 44,000 packages Indian tea offered, 41,000 found purchasers.

Green Tea.

Mr. H. Drummond Deane wr of the Peermaad District :—"Pla herein bearing average well over 450 lbs. per acre and so up to 600 lbs. per acre and I take it the average cost *f.* does not exceed 20 cents in this district and they are g high-grown teas. If you turn up Peermaad teas sold Colombo some ten years ago you will find very fair averag comparing with Ceylon, for Kuduwa Karuam ; Bon Ar Penshurst ; Mount ; Glenmary. I wonder when we sh begin to hear result of sales of green teas in America ; w do not we see the prices quoted for teas like Brunswi Moray, Darrawella, etc.? If they are fairly good it wo stimulate the manufacture and they cannot be very bad those estates would not continue making. I think the 'Thi Committee' should when paying the bounty on green insist on having *copies of all sales* sent them."

Coffee in New York.

There has been a firm and ris market since our last report, wholly to speculative influences, says the *American Gro* of 27th February, 1901. Trading in options has been act with transactions greatly increased. The deliveries of co are running much lighter than last year at this time. ceipts at ports in Brazil continue large. On the spot, for No. 7 Rio, and 8⅜ @ 8½c for No. 3. Mild sorts are m firmly held, with demand moderate. Padang Interior h from 17½ @ 20c, with Fancy mats at 27 @ 29c, and possi higher for extra fine lots ; Mocha 16 @ 19c, and better fancy ; good Cucuta, 9c ; best washed Merida and ot Maracaibo sorts, 12 @ 12½c ; Bogota, washed, 10 @ 1 Bucaramanga, washed, 10 @ 16c ; Central American, be grades, 9½ @ 15c ; Mexican, washed, 12 @ 14c for b Total stock of mild coffee in New York, February 25,239, bags ; in United States, 262,359 bags.

New Coffee.

In the annual report of the Tr dad Department of Agriculture 1899 it was mentioned that several plants raised from see *Coffea stenophylla*, appeared to differ from the type to suc

egree, as to indicate them as either natural hybrids, or eminal varieties, having characters distinct from their mater-al parent. Several of these trees are now fruiting, and the rst to mature has given a small crop of berries of a dark urple colour, with beans about the size of the average rabian. These beans have a slightly rough parchment skin hich recalls a character in the Liberian. The parchment omes away easily and reveals an inner skin corresponding the "silver skin" of Arabian, of a greenish yellow colour, hich is thin and easily removed. The beans are fully 100 er cent. larger than those produced by the type plants of *offea stenophylla*. Other plants are also ripening fruit which ary considerably in size, some being nearly as large as iberian, while others are not larger than the typical beans f *Coffea stenophylla*. The possibilities before this new strain f coffee are very obvious, but at this early stage it is, of ourse, impossible to say what the cropping capacity of the ew plants will be, or to estimate the quality and value of eir produce.

---

eylon Tea in Russia.

Russia gains ground in Ceylon as Ceylon tea gains ground in Russia. Mr. W. P. Ampenoffe, who represents one of the largest firms, not the largest, in Russia, known as "The Trading Company, uccessors to Alexis Goobkin, A. Koosnetzoff & Co." has arrived Colombo to open a new firm there. Interviewed by a repre-entative of the *Times of Ceylon*, Mr. Ampenoffe was not dispos-d to say very much. The firm which he represents has been ealing largely in Ceylon teas, and he has been sent out to eylon owing to the increasing business of the firm. Hither-o, there were three Russian and one English house buying ea for them locally. Speaking of the progress of Ceylon ea in Russia, Mr. Ampenoffe testified to the growing taste or it. A good deal of it was sold pure, he said, but the eople still preferred a mixture with China tea. The medium lass of Ceylon tea was liked best. Mr. Ampenoffe, from ome figures in his possession, pointed out that the Ceylon xports to Russia could hardly be compared to the 55,000,000 bs. of Congou tea alone that was now imported, but he elieved that the amount of Ceylon tea going annually to Russia was bound to increase. What chances Ceylon green ea would have in Russia he was unable to say. A good eal of China green tea was now used.

---

oasted Coffee.

The *Spicy Monthly* (C. F. Blanke Tea and Coffee Company) claims that ry roast coffee has no advantages over any other sort of oasted coffee. It says: "The reason the water is added to offee just before it is finished roasting is to prevent it from ver-roasting while the coffee is being taken off the fire and ut to the cooling fan. If this were not done, the coffee vould continue to roast, and could not be roasted uniform. The probabilities would be that the coffee would be over-roast-d. Besides this, adding the water proves very beneficial in he way of taking off impurities in the steam which generates, vhen the water is put in. The water that is added does not ecessarily increase the weight, as it is all evaporated by the eat of the coffee before the coffee is entirely cooled off. A ry roast can be made, but when a coffee is roasted that way he chances are nine out of ten that it will not be satisfactory. The average merchant objects to the ordinary roast, or, to esignate it more clearly, a wet roast, because he imagines he water is added to increase the weight, which is not the case. If enough water should be added to increase the weight, it would hurt the quality of the coffee. And no roaster would be foolish enough to jeopardize his interests by affecting the quality of the coffee and roasts before it leaves his hands."

Planting in Hawaii.

An old planter, writing from Honolulu to a friend in Ceylon, two months back, says:—"The soil is simply magnificent. I never saw the like in any part of the world in which I have been. The climate is splendid and the suburbs are charming. A huge botanical garden of palms, ferns, etc. The town of Honolulu is much like those in England, good shops, etc. The Americans are a go-a-head lot. They knock the English into a "cocked-hat." Money seems to be no object to them. Everything is done in the most up-to-date fashion Hotel, electric cars, music (bands), etc., tip-top. Wages are high. Carpenters, plumbers, etc., get as much as $5 (£1) a day. I wish I was a carpenter!! Fancy; the Sugar estates give a profit of from £80 to £90 per acre. No wonder everybody swears by sugar. It is difficult to get the people here to talk of anything else. I have only seen one cultivated Vanilla vine, and that one has a blossom on it equal in value to £2 in hand. This beats sugar! and so far as I can make out the vines blossom twelve months after planting. May I venture to ask you to send me a little Cinchona, Succirubra, and Croton seed. Just a little to give them a trial. I shall feel deeply indebted to you if you will. Tea is no good here owing to the price of labour: ditto coffee. By the way I intend sending you some of the latter, when I can get some ripe berries. The trees are free from *Hemileia Vastatrix*, and the coffee is the finest in the world for flavour. Eh! Mon! (as Geordie Morres used to say) this is a grand country for a man with money to settle in. I am going to see what a man without money can do."

Botanical Research in Ceylon and Malaya.

The *Times of Ceylon*, of 29th ultimo, says:—Mr. A. G. Tansley, an enthusiast in Botany, who arrived here at the end of September last, to carry out investigations in tropical vegetation, and especially to study the lower forms of plant life, left yesterday afternoon by the P. & O. *Oceana*, having completed an interesting tour in Ceylon and the Malay Peninsula. Mr. Tansley joined his friend, Dr. Lang, who arrived in the island two months before him, and they worked together both in Ceylon and Malaya. Mr. Tansley spent, in all, three months in the island, first of all visiting the Royal Botanic Gardens at Peradeniya . . . After his visit up-country, Mr. Tansley went on a tour in the Southern Province, exploring the jungle in the vicinity of Tangalle. He is thoroughly satisfied with the result of his work, and is taking away with him five large cases containing various interesting specimens secured in the island, besides a smaller collection from Malaya. He disembarks at Aden and starts on a short collecting tour in Egypt, and will finally leave for England by the P. & O. boat following a fortnight later. His notes will be consulted on his return home, and the result of his work will, undoubtedly, be useful. Mr. Tansley informed a representative of this paper that Dr. Lang had made some very interesting plant discoveries during his investigations here and in Malaya. There are five different kinds of plants, allied to ferns, which have a new stage in plant life called *prethallus*, and Dr. Lang dis-

covered no less than three of these plants, two being secured at Hanwella, and one at Taiping, in Malaya.

Fibre in Yucatan. The British Consul at Yucatan reports that the production of hemp during 1900 shows an increase of 20,000 bales, or about 3,000 tons in excess of that of 1899, probably about the limit under present conditions. It is estimated that there are about 350 square miles of land under fibre cultivation in Yucatan. The variety principally produced is that called *sisalana agave*, and the number of plants which has been found to give the most satisfactory result is 84 to the mecate of 576 square varas, Spanish, or 4,457 square feet. The sucker are planted 2 varas (about 5½ feet) apart, or in rows of 12 by seven plants. The annual yield per mecate (4,457 square feet) is roughly estimated at 100 lbs. The cost of production is 4c., say 1d. per lb., and the selling price in October last was about 9c., say 2¼d. per lb. The price is subject to occasional violent fluctuations, arising from speculation, and the fibre has been sold as high as 22c., or 5½d. per lb. For industrial purposes fibre less than 3 feet long is unsuitable and generally unsaleable. The machinery employed is driven by steam-power. The wheels originally in use are called scutchers, manufactured in Leicester, England. These wheels are now being superseded, and can be purchased in Merida, second-hand, for about 10/ a-piece. The new automatic machines are by Prieto, a Spanish manufacturer, and are also made in New York and Merida by Villamor, Pornella, and by Lopez. All these machines can be purchased in Merida at from 3,000 to 8,000 dol. Mexican currency, say from 300/ to 800/. These new machines are only employed on the larger estates. There are no English firms engaged in the henequen business in Merida. The principal purchasers and exporters of the fibre in Merida are Messrs. Henry W. Peabody & Co., of Boston.

LETTERS TO THE EDITOR.

COFFEE PRUNING.

Sir,—A sufficient time having elapsed since the coffee pruning season to show the results of the different systems in vogue, I have addressed a few words to you on the subject, hoping that they may draw the attention of others interested in coffee to the important operation, and perhaps bring out the results of their experience in your valuable paper, which I think has a greater circulation among planters than any other.

Planters are much divided in their opinions on pruning, and between the two extremes of not pruning at all, or very lightly, and of chopping the trees to pieces, lies the happy mean of those who prune, not according to any fixed system, but according to the varying requirements of the different trees, soils, climates, previous crops, etc. It must appear to anyone on consideration, that no one system can be laid down as applicable to trees of all ages and conditions, but that what may be a very proper mode of treatment when applied to young trees, may be most injurious to old ones. One great mistake into which many planters fall is the idea that pruning a tree immediately causes it to throw out a large amount of young wood, and that the more heavily the knife is put in the more vigorous the sprouting of the shoots. Now there is not the slightest doubt but that the first effect of pruning, especially of heavy pruning, is to check the flow of sap.

In a young and healthy tree with a sufficiency of folia to carry on the circulation the tree very soon overcom the check, the sap resumes its ordinary flow, and new bu burst out in all directions. In an old tree which has bor heavily, the effect is very different. After taking off the cr the tree is almost exhausted, and so far from checking t sap, every means should be used for its circulation. All t old wood that has borne that year should be cut off, provid there is young wood on the tree ; if there is none, enough o wood must be left to furnish foliage to keep up the flow sap until the rains set in.

Coffee trees from 18 to 20 years of age throw little or new wood on their primaries, but the old secondaries on the usually quite make up for this by their numbers of te tiaries, and the pruning of old coffee should be almost entire confined to the latter. Suppose in the case of an old tr which has borne heavily on its tertiaries that the old secon aries are taken off, leaving merely the bare primaries ; remarked, above the first effect would be to check the sa The tree is completely exhausted, and what little circulati there is receives a check ; the tree has no leaves to help it tide over the dry months, and it never recovers the fi check of the knife. The branches begin to die back gr dually until the rain sets in, then sap begins to be pump up again, and what there is left of the primary throws b sickly little shoots, which develops into gormandizers, drai ing the tree of its sap, and preventing the formation of go wood. If such a tree had been pruned moderately, the o secondaries allowed to remain, the tertiaries which had bor been taken off, and as much foliage as possible left on, the tr would have most probably recovered, and given a small cr the following year on its remaining tertiaries. By the latt method the sap would have never been entirely checked, but t few leaves on the tree would have kept it going until the rai when the old secondaries would have utilized the excess sap which then springs up, by throwing tertiaries instead as in the former case where the superabundant sap, n leaving sufficient room to develop shoots in a regular manne expends all its strength in forcing out malformed ill-growi gormandizers from its primaries.

Leaves, as has often been remarked, are the lungs of t tree, and when a tree is stripped of them, it is a mere to up, whether it ever recovers or not, in fact it never co pletely recovers. Some of the primaries will always d It is much better to leave bad and useless wood with leav than none at all. Anyone who has had much to do wi the cultivation of coffee cannot have failed to observe t strong healthy shoots which almost invariably spring fr the knots on primaries, or secondaries, when a straggli and in itself useless branch with a leaf or two at the en has been left on. These straggling branches can be cut the following year, for then they will have served th purpose.

Young trees will stand almost any kind of pruning, b because they live through it, that must not be taken as proof that it has done them good, but rather that th vigor has enabled them to suffer such ill-usage and co out of it unscathed. It is too much the custom to take t result of some particular system, applied at some particul time to some particular estate, as a proof that such syst is proper for all times on all estates, in fact generalizi

om particulars or in other words going by rule of thumb. ll pruning rules are arbitrary, but the object striven to be tained is always the same, namely to equalize crops, open e tree out to sun and air and remove useless wood to make om for new wood. To achieve these points some rules must laid down to be applied generally, but to be modified as rticular cases require. In the case of a tree with little ood on, what benefit is obtained by cutting away the few anches it has, merely because they have borne? In this se there is no danger of over-bearing: the tree is not rown up with wood, and there is room for new wood; and et it is common to see such trees treated merely for the sake carrying out a system. In fact, strict adherence to a system often kept in view instead of the results, for the attainent of which such system was instituted. If these few marks on pruning should call forth any ideas on the subject om more experienced men, the writer's object will have been ained.

MYSORE,

GENERAL ARTICLES.

RUBBER EXTRACTION FROM BARK.

Mr. A. Godefroy-Lebeuf writes from Paris to the *Ceylon bserver*:—

The process of extraction of the rubber from the bark is making ery quick progress. Ten years ago nobody was thinking about it. -day we have a few reports on the opportuneness of such a process. ou know that many plants are exploited by the cutting of the em, what you call, I believe, peeling the tree; such are many ots, and slow growers such as *Muscarenhasia* and others from adagascar. *Landolphia Hendelotii* from Soudan, and a lot of roots imitively neglected because it was quite out of practice to tap em by the common process,

Some were cut in pieces and put to bleed into recipients, as is ne with *Urceolo*; but all the sap remaining in the bark after the eration was lost for ever. Now you can obtain from that eglected bark more rubber than the quantity obtained from the tex; and I know people asking for our process, intending to use for the neglected barks left by the natives on the spot.

If it is true in the countries where the natives are accustomed to p the vines, how much more in the regions where the collector ust make the education of the collector of rubber, what can be e colour of his skin? If *par-dessus le marche*, the Governor of the lony has promulgated laws for the regulation of collecting the bber, avoiding the cutting of the vines, stating that they must be pped in official mode: when these vines are so long, so old, so rge, the collector thinks that the weather is too bad for working d he sleeps till better times. But if you can say to the collector: and cut the vines, but bring me the rubber you have obtained d if it is too meticulous [timid!] for you, bring me the bark, the hite, yellow, black or undetermined,—the coloured man will think at to cut the vines is a very pleasant work for him and the crop the bark a very pleasant one for his wife and he will go to work once.

If it is true for the collecting of the bark, how much more it for the *enrichissement*—another word I cannot manage—of is bark.

The *Landolphia Hendelotii* per oz. contains from 7 per cent. to 1 er cent. of pure rubber. When the bark is dried quickly,—and I ay quickly because when the operation is done slowly the fermenation is a cause of loss of the gum,—this bark is easily broken in mortar, a common one for the decortication of paddy; so after few minutes the operator can seperate a few per cent. of the imurities, and as generally native women are expert in the manipuation of the pestle, their lords and masters have no hesitation in ntrusting them to perfect this work.

I have received bark of better rubber prepared by the female beauties of Senegal, containing no more than 20 per cent. of impurities. Such rubber is a very commercial one and will be accepted on any market.

It is naturally much more difficult to bring this rubber to purity, but we must not be too exacting and such rubber will lead the way in the manufacture of pure rubber. With patience it is possible to obtain nearly pure rubber by these primitive processes; but the buyer is judge of the question; he can pay the rubber on the percentage and the analysis is quite mechanical. If the buyer take one ounce of the product and use an iron mortar and pestle and take the formation of nature; after a few minutes, if he has had the precaution of wetting the bark he will extract a certain proportion of impurities and obtain a parcel of rubber nearly pure and a sufficient sample for judging the quality and the quantity of good rubber in the sample. After a very short time he will be able to avoid any mistake.

The extraction of rubber from the bark gives better product than the bleeding:—I send you a little sample of Borneo rubber obtained two years ago, and you will see that it is much better than the rubber generally offered on the market from this country It has been prepared by a collector using this process for the first time. It is enough for to-day.

TEA IN INDIA.

It is not quite clear whether the remarks with which the Viceroy concluded the debate on the Assam Labour Bill should be taken as indicative of a belief that the question of developing the demand for tea for local consumption is one that has not occupied the attention of the Indian tea industry, or merely of an opinion that more might advantageously be done for the purpose than has yet been attempted. In the former case he is, of course, labouring under a mistake. In the latter he is probably right. When, however, His Excellency describes the market which lies at the planter's door as the most splendid in the world if he would only cultivate it, we are afraid he ignores, or greatly underrates, the difficulties that stand in the way of tea becoming the "staple drink" of the people of India, or even of the Indian artisan, whom he seems specially to have had in view. The difficulties to be overcome are, in fact, of three kinds—the difficulty of taste, the economic difficulty, and the difficult of machinery. Except among the better classes of Mahomedans, the taste for tea-drinking is practically non-existent in the plains of India. The mass of the people, indeed, regard tea as a medicine, and would not use it as an ordinary beverage even if supplied with it for nothing. Admitting, however, that under favourable conditions the taste might be acquired, the economic difficulty, as far as the bulk of the population are concerned, is an insuperable bar to its acquisition, as it would be to its gratification if it existed. Even if there were nothing but the price of the tea to be considered, and if, as with the necessary organisation it probably might be, it were made generally available to the retail purchaser at a pice an ounce, the addition to the cost of living which its habitual use would entail would be out of the question for ninety-nine out of a hundred of the people of India. But it is not only the price of the tea, but also the cost of the fuel that would be necessary for the preparation of the infusion that has to be considered; and to the mass of the people, who are hard put to it to find the means of cooking their daily rice, this in itself would be a serious matter. Then, again, there is the difficulty of distributing machinery. If even the lowest qualities of tea are to be made generally available to retail purchasers at anything like the price just mentioned, it must be by means of some kind of special organisation, and not in the ordinary course of trade, at all events for some years to come. But what organisation that would be at once effective for the purpose and not disproportionately costly, is conceivable? The village bunniah possibly might be induced to sell pice packets of tea for a small commission, if he were required to pay only for what he sold. But the risk and the labour in the way of stock and account taking and collection of proceeds which this would entail, would, if we are not mistaken, be prohibitive. The police are out of the question, because, if for no other reason, people would not go to them for tea, even if they could get it for nothing. The post offices have been suggested, and, if they were allowed to dispense pice packets of tea for the planter, as they at present do pice packets of quinine for the Government, something, though not very much, towards the popularisation of the

beverage might perhaps be effected. But so far, the Government has not seen its way to allowing this. It is in the highest degree improbable, however, that even with the most perfect distributing agency, and with tea sold at a pice an ounce, more than a small fraction of the population of India would, under present economic conditions drink tea otherwise than as a medicine or an occasional luxury. Still, we have little doubt that, with time and effort, the present demand for tea for local consumption might be considerably increased; and the question whether any, and if so what, steps should be taken to develop it, is one deserving of the careful consideration of those interested in the industry. The putting up of a certain quantity of tea in very small packets that would preserve it from deterioration through exposure to the atmosphere on contact with other substances, is probably an essential condition of any considerable advance in this direction. The provision of some form of petroleum lamp that would not cost more than a few annas, and would serve alike for the purpose of illumination and the boiling of a moderate quantity of water, might not impossibly be an important auxiliary step.—*Statesman.*

COFFEE IN LONDON.

The *London Commercial Record*, of 15th ultimo, remarks :—

The week closing to-day has not been without its exciting moments to operators in several of our trades, and although in some instances results have fallen short of expectations, the renewed life in dormant markets formed a pleasant feature. Strange to say America has been the moving spirit again, wholly and solely, and the key-note struck by New York, has been accepted and resounded by our markets. Thus new life and activity were instilled into our Sugar market the moment the American Trust showed some inclination to purchase. Instead of a dull and steadily declining market, which of late had exercised its depressing effect on the spirits of all favouring sugar, we saw, produced as by magic, a strong tone, renewed confidence, and quickly rising values. Sugar enjoyed renewed attention, bulls once more increasing in number. As beneficial as the American demand has been on the position of sugar, so depressing and discouraging has been the sudden withdrawal of the support to coffee, given lately by the American Coffee Ring. Only last week the hope of a lasting boom seemed perfectly justified by the action of the Ring in question, and we can blame no one for having been misled by it and persuaded to join the merry throng of bulls. As we pointed out only a short while ago, it was the feature of the movement in coffee that London bulls in their mistrust of the sincerity of the Coffee Ring held aloof from the market, preferring to await further development ere they decided to change their view of the terminal market and become converted bears; but the extent of the movement, the strength and apparent determination displayed by the Ring last week left them no choice, they could not sit still in the face of a rapidly rising market, they felt they ought to be in the swim and profit by the spurt Bears joined the Ring, therefore, in a body, and their united buying gave exceptional life and vigour to the market; in fact, so much so that actual coffees which, paralysed by the excessive weight of stocks and floating parcels, had failed to join the movement, became animated and recorded prices in the sales which gladdened the heart of many holders. Everyone was inclined to believe that we had at last arrived at the eve of a considerable rise, and the disappointment is easy to imagine when suddenly the American Ring ceased buying, robbing thereby the movement of its principal support. Our bulls pluckily stuck to their holdings and exerted every effort to stave off the decline which was beginning to spread the moment the Ring disappeared. The enormous receipts, about 30,000 bags, instead of an average of 20,000 bags, however, proved too much for the bulls, the weight of supplies was too great and prices steadily declined under their pressure. Actual coffees once more became a drug in the market, and bears again ruled the day. Bulls cling to the hope—and not an unjustifiable one—that the Coffee Ring has withdrawn its support with a view of flattening the market to enable its members to make fresh purchases presently at cheap prices. The phenomenal receipts of Brazils may have had a sobering effect on the spirits of the Ring; whatever the cause, it is a dangerous thing to embark largely in an undertaking which for its basis has the sole support of an outside speculative element.

DISTRICT ASSOCIATIONS.

SHEVAROY.

Extracts from Proceedings of the Committee of the Sheva Planters' Association at their monthly Meeting held on 1st April, 1901, in the Victoria Rooms, at 1 p.m. Present Rev. M. Anderson, Messrs. J. C. Large, W. J. Lechler, R J. M. Kempf, Messrs. C. Rahm, R. Gompertz (*Honor Secretary*).

Yercaud, 2*nd April*, 1901. } (Signed) Robt. Gompertz, *Honorary Secretary, S. P.*

MARKET REPORT.

[*Per Mail advices of* 15*th March* 1901.]

COFFEE.

The London Commercial Record says :—The recent heavy arriva which are being freely placed on the market, have exercised depressing influence upon prices, which, with a few exceptio shew a decided decline for the week, the market to-day closi with a weak tone. Further considerable supplies of East In have been brought to auction and, with the exception of the fin qualities, prices generally shew a reduction of 2s to 3s per c Costa Rica has also been freely offered, and, as importers ha been desirous of making progress, the latest rates are fully 2s to below those current a week ago. With the continuance of la Brazilian receipts and a falling exchange, together with realisi by speculators, the market for "futures" shews the import decline of 2s 6d since our last, business being done yesterday May delivery at 31s to 31s 6d, July at 31s 4½d to 31s 6d. Septem at 31s 10½d to 32s 6d, and December at 32s 4½d to 32s 10½d per c Auction supplies to-day consisted of 2,057 bags East India, 2, bags Costa Rica, 464 bags Guatemala, 100 bags Salvador, and bags Central American. The sales passed off with fair demand a full rates were paid.

Rio Exchange 11 $\frac{9}{16}$d, previous day 11 $\frac{1}{16}$d.

HAVRE, *Mar.* 14.—Good average Santos March opened quiet 38f. and closed barely steady at 37$\frac{3}{4}$f., May opened at 38$\frac{1}{2}$f. and osed at 38$\frac{1}{4}$f., September opened at 39$\frac{1}{4}$f. and closed at 39f., ecember opened at 39$\frac{3}{4}$f. and closed at 39$\frac{1}{2}$f.

HAMBURG, *Mar.* 14.—Good average Santos March opened quiet 31pf. and closed steady at 31pf., May opened at 31$\frac{1}{2}$pf. and osed at 31$\frac{3}{4}$pf., September opened at 32$\frac{1}{2}$pf., and closed at 32$\frac{3}{4}$pf., ecember opened at 33pf. and closed at 33$\frac{1}{4}$pf.

NEW YORK, *Mar.* 15.—Closing prices of No. 7 Rio were as follow:—

		Mar.	April.	May.	June.	July.
March	15...	5·65	5·75	5·80	5·80	5·85
March	14...	5·75	5·75	5·85	5·85	5·85

TEA.

INDIAN.—Public auctions totalled 44,800 packages, against 45,200 packages last week, and 41,500 for the corresponding period of 1900.

The market remains without material alteration, inferior descriptions continuing dull of sale, while those with useful infusions ruled firm. Medium to fine, particularly several of the closing shipments, met with spirited competition, and full prices were recorded for them. Finest and choice parcels also commanded considerable attention as the supply is fast becoming exhausted. The following are among the best quotations:—Assam: Samdang Estate DDT & Co., BP 2s 5d; Dhoedaam Co., BOP 2s 4$\frac{1}{4}$d, BP 2s 2$\frac{3}{4}$d, OP 2s 1d; Hansura Estate, DDT & Co. BOP 2s 0$\frac{1}{4}$d; Beesakopi Estate, DDT & Co., BOP 1s 11d, and Hilika Estate, AFTCo., BOP 1s 9$\frac{1}{4}$d per lb. Darjeeling: Okayti Co., BOP 2s 4$\frac{1}{4}$d, OP 2s 2$\frac{1}{2}$d, P 1s 10$\frac{3}{4}$d, and Goomte Estate, BP 2s 3$\frac{1}{2}$d, OP 2s 1$\frac{3}{4}$d.

Rather over 2,700 packages from South India were offered. Quality for the greater part was not attractive, and results generally were disappointing.

For 38,560 packages on Estate Account 7d per lb. was obtained versus 8$\frac{1}{4}$d per lb. for 31,600 packages, and 9$\frac{1}{4}$d per lb. for 25,900 packages in the two preceding seasons.

For the past two months especially there has been an active demand, the quantity sent abroad during that time being 2,419,000 lbs. compared with 1,426,000 lbs. a year ago.

CEYLON.—Catalogues comprised 28,400 packages contrasted with 34,500 packages previously and 24,500 packages twelve months since.

There was no improvement in the enquiry for the lower grades, which often tended in favour of buyers, particularly for small breaks, the proportion of which was unusually large. In the case of invoices where flavour was better than that of foregoing once the bidding was brisker and in most instances advanced quotations were made. Continental and Candian buyers were operating more freely and some of the Pekoes and Orange Pekoes suitable to their requirements, being also wanted by the home trade, brought enhanced rates. Higher figures were paid to secure the finest lots. A consignment of 60 packages of Green Tea from North Pundaloya realised 7$\frac{3}{4}$d per lb.

The average is 6$\frac{1}{2}$d per lb. On the 8th instant it stood at 6$\frac{5}{8}$d per lb. and 7$\frac{1}{2}$d per lb. in 1900.

JAVA.—About 2,500 packages, mainly of direct import, passed the hammer, common as a rule being depressed, though fine lines were occasionally dearer. For next week 1,800 packages are advertised.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns are, *viz.*:—

From 1st to 12th March,	1901	...	...	6,847,984 lbs.

Also 785 packages from second hands.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon and Java Tea Report, dated March 15th, 1901, says:—

Quantity brought to Auction in London from 1st June to date.

	Indian.	Ceylon.	Java.
	Pkgs.	Pkgs.	Pkgs.
1900-1901	1,413,979	1,041,248	49,559
1899-1900	1,426,772	954,145	45,666

45,737 *pkgs.* Indian
28,852 „ Ceylon
2,528 „ Java
} Total 77,117 packages were offered in public auction this week.

There has been an encouraging development in the use of Indian and Ceylon Tea in markets outside the United Kingdom; this is doubtless due in part to the abnormally low prices ruling, and probably also to the unsettled condition of the Chinese Empire. Fourteen million pounds more of British-grown Tea were taken by these outside markets in 1900 than was the case in 1899.

It is a remarkable fact that in 1890 only about 13 million pounds of Indian and Ceylon Tea were taken in markets other than the United Kingdom, while in 1900 the quantity had risen to just under 83 million pounds.

In spite of the enormous relief thus afforded to the Tea producing industry, production has increased too rapidlyfor consumption to keep pace with it.

Indian.—The market was very steady, bidding for medium and better Teas being strong, with a tendency towards higher prices, common grades remaining without alteration. The following averages are worthly of note:—"Okayti T Co.," 1/10; "Dhoedaam T Co.," 1/5½; "Runglee Rungliot," 1/2½; "Goomtee," 1/2¼.

Week's average of Tea sold on Garden Account 1901, 38,263 pkgs., av. 6·86d. 1900, 32,604 pkgs., av. 8·00d.

Total Tea sold on Garden Account 1st June, 1900, to date, 1,175,573 pkgs., av. 7·26d. 1900, 1,117,545 pkgs., av. 8·33d.

Ceylon.—The auction was distinctly lighter, only 28,852 packages being brought forward against 34,903 last week. Anything with fair quality met with good attention from the Trade and sold well, slight advances being occasionally recorded. Common descriptions, however, showed no change from last week's rates.

Average for week 6·48d. against 7·50d. in 1900.

Ceylon Tea sold on Garden Account 1st Jan. to date, 284,426 pkgs., av. 6·47d. 1900, 253,738 pkgs., av. 7·58d.

Java.—Medium and better Teas sold well, but commoner kinds passed slowly and many lots were withdrawn.

Bank Rate 4 per cent. Exchange on London, three months' sight:—Calcutta 1/4 7/32. Colombo 1/4¼.

COCOA.

The market is very quiet, but there is hardly any change in prices. At auction on Tuesday 2,860 bags were brought forward, of which 1,080 bags sold. Of 994 bags Trinidad catalogued 600 bags sold at steady rates—very fine red 72s 6d, middling to fine 67s 6d to 70s. 35 bags fair Dominica realised 62s, and 40 bags Jamaica 61s to 62s 6d, these prices being about valuation. 6 bags Tobago brought 64s. Of 539 bags Guayquil about 90 bags were placed, at 61s to 61s 6d for Esmeralda. 551 bags Haiti were withdrawn. 35 bags African about half sold at 62s for ordinary. Ceylon continues very slow, and of the 785 bags brought forward only about 300 bags sold—common medium and small 62s 6d to 67s 6d, small 55s 6d to 62s, and blacks 54s 6d to 55s 6d per cwt. Privately 200 bags Ceylon sold at rather easier prices, and 100 bags good Arriba at 80s per cwt.

PEPPER.

Black.—Is quiet on spot and lower to arrive; in the former position fair Singapore sold at 6 1/32d, whilst in the latter 100 tons done at 6 7/32d to 6 3/16d per lb. March-May (s.).

At auction on Wednesday 287 bags Trang bought in at 6⅛d, also 180 bags Aleppy at 6⅛d and 395 bags Lampong at 5¾d. 12 bags rather light Ceylon sold at 5⅝d per lb.

White.—Is cheaper, especially for Penang. On spot fair Singapore sold at 9d and Penang at 8⅜d, whilst to arrive 25 tons Singapore near at hand sold at 8 15/16d to 8⅞d per lb.

At public sale on the 13th instant 165 bags Singapore retired 8¾d to 9¼d, and 158 bags Penang at 8⅛d to 8¾d per lb.

GINGER.

Cochin.—The small supply of 15 cases 77 bags offered passed hammer unsold—medium and small cut at 47s 6d, dusty cutti at 31s and rough D's at 28s per cwt. Privately the market is v firm and 300 bags ordinary medium and small washed rough h been sold at 35s 6d (now 36s asked), also 60 to 80 cases C cut at and small Native cut at 32s per cwt.

Japan.—90 bags fair limed retired at 33s per cwt.

Jamaica.—In fair request and of 347 barrels offered 230 barr sold—good bright washed 50s to 51s, middling 44s to 47s common to low middling 37s 6d to 43s, and Rhatoon 34s to 36s cwt., these prices showing an advance on the best lots, oth being steady.

CINCHONA.

At auction on Tuesday there was a good demand, and practica everything was sold at an advance of from 15 per cent. to 20 cent. on the last London sales, the average unit being 1¾*d.* agai 1½*d.* at the February auctions.

The quantities of bark offered and sold were as follows:—

	Packages Offered.	Packages Sold.
East Indian cinchona	902	677
Java cinchona	424	374
Calisaya cinchona	362	362
African cinchona	149	149
Ceylon cinchona	26	20
	1,863	1,582

The following table shows the approximate quantity of b purchased by the principal buyers:—

	Lbs.
Mannheim and Amsterdam factories	92,653
American factory	49,623
Imperial factory	48,114
Frankfort-on-Main and Stuttgart factories	43,526
Brunswick factory	21,290
Messrs. Howards & Sons	16,850
Druggists, &c.	27,699
Total quantity sold	299,755
Bought in or withdrawn ...	75,470
Total quantity offered ...	375,225

The prices paid were as follow:—

Java.—Ledgeriana, original stem chips, 7*d.* to 10*d.* per lb.; ro 3¼*d.* to 4¾*d.*

Ceylon.—Succiruba chips and shavings, 3⅝*d* to 5½d.

South American.—Bolivian cultivated Calisaya, quill, fair good, 6¾d to 11⅛d; broken quill, 5½d: flat cultivated sound, 0½; and damaged, 8¾d to 11d.

African.—Broken quill and chips, 4¾d to 7⅝d; and mediu quill, 6⅝d to 7d per lb.

East Indian.—Ledgeriana, original stem chips, 4⅞d to 9 branch, 3⅝d to 6⅛d; and root, 7¼d to 8⅜d. Red, original ste 2¾d to 4⅜d; chips, 3¾d to 4d; renewed, 6½d; and root, 3d to 4½ crown chips, 3d to 6¾d; renewed ditto, 6⅜d to 8⅞d; chips a shavings, 2d to 9½d; shavings, 5⅞d; and branch, 5⅛d per lb.

The auction to be held in Amsterdam on March 28 will consist 4,601 bales Ledgeriana and hybrid, and 207 cases, 1,172 ba succirubra, weighing together 545,468 kilos. Java bark, and co sisting of 375,340 kilos. Ledgeriana, 106,723 kilos. succirubra, a 63,435 koilos. hybrid. The stock in first hands at Amsterdam March 5 consisted of 2,819 packages Government and 8,060 packag private bark, including the quantity to be offered in the abo auction. In the drug-auction 3 serons Loxa quill sold at from 2½d to 1s 7d, and Huanoco ditto at 6d to 6½d per lb.

QUININE.

Quinine has shown renewed activity this week in the secon hand market, and a good business has been done at dearer pric the spot price for good German sulphate having advanced to 3⅞d, and forward positions at proportionately higher rat Howards' have advanced their quotation to 1s 7d 1,000 oz. lots vials, and B. & S. now quote 1s 4½d, and Amsterdam 1s 4d. T improved position is due to the advance in the unit at the Lond bark-auction on Tuesday. The Java shipments during the l fourteen days were 623,000 Dutch lbs.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 per line for the first; As. 3 for the second, and As. 2 for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for One Rupee; non-Subscribers will be charged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to E. C. DUFF & CO., Proprietors, "Planting Opinion," 106, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 19th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Coorg.

Polli Betta, *3rd April.*—*Weather*—No rain since last report. Clouds working up. They have begun early this morning and look promising. Rain now would be seasonable, but it must be copious. *Crops*—all over. Some pruning still to be done. There is manuring in hand also. Most places have paid off and reduced hands. *Health*—Fair.

Coorg.

Polli Betta, *10th April.*—*Weather*—Heavy thunderstorm here on night of 8th. Some places had an inch of rain. There was some hail—much cooler now. *Crop*—Previous blossoms appear to have set. *Labour*—mostly paid off and places reduced. *Health*—Fair. *Interesting item*—Camp of Exercise on at Mercara. Many members from this side have gone up to it.

Munzerabad.

April 2nd.—*Weather*—Hot days and hot nights, an easterly wind by day and west by night. *Crop*—Each of this year's blossoms have had a most satisfactory setting, some of the first blossom is swelling already. *Works*—Pruning, manuring and shade lopping. *Labour*—Abundant. *Health*—Good. *Interesting item*—Our roads, which are now being complained of in the *Madras Mail*, are badly in want of repair; the holes were carefully filled in with earth for the Resident to roll luxuriously over, but for the resident with a small r, the sun and wind are allowed unchecked to re-excavate, and the holes are as before.

THE RESTRICTION OF OUTPUT OF TEA.

The 15th March, 1901, was the last day fixed for the receipt at the Ceylon Association Rooms in London of signatures to the Tea Restriction proposal. A good many signatures appear to have waited until the last moment, and more may still be 'lying low;' waiting to see how the proposal has 'caught on.' At any rate, the London correspondent of the *Times of Ceylon* writes:—"In all about one million lbs. have been struck off by the voluntary promises of Companies and Proprietors according to the list at Gracechurch Street, and there is at least one Company of influence which express themselves as agreeable to carry out the arrangement on their estates, though they are not willing to sign the circular and say so in black and white. One cannot very well see why, in such a case as this, people who are willing to comply with the conditions should not be willing to say so; but after all if the thing is *done*, it is of no great consequence whether the doing of it is made public or not, perhaps." That is a debatable point; for the Company that declares its intention doubtless leads other Companies and some individuals, whereas the Company that keeps its intentions dark is more likely to encourage the doubting Thomases. Calcutta advices show that a restriction of output to the extent of 3½ million pounds has been agreed to, and if, as we suppose, this is in addition to the quantity advised from London, a total of about 4,500,000 lbs. is arrived at. A good deal below the 10 per cent. reduction by 80 per cent. of planters that was required. So much below, that we are by no means satisfied that the scheme will yet be practically tried, though we understand, that the time for receipt of signatures has now been extended.

The London correspondent of the *Ceylon Observer* appears to be very sanguine. He writes to that paper:—"First of all, when Mr. Rosling's proposals appeared, your columns were filled with criticisms of them. They were crude, futile, Utopian, and what not. People here naturally began to think Ceylon would have none of them. Meanwhile the Joint Committee brought out their scheme, and as I have stated from time to time, though it evoked little enthusiasm, it met with a fair amount of support. Your Overland received by last mail informed us that the Committee's suggestions had been carefully considered and ruled out as impracticable, and that the meeting had voted almost unanimously in favour of the much decried proposals of the Chairman. This was sufficiently startling, but there was more to follow. For a cable has been received at the Ceylon Association stating that the Joint Committee's suggestions have now been adopted." At the same time he adds "that it is sufficient to know that the Ceylon and London bodies are now at one and are endeavouring to get the required number of assents. Whether they will be successful in this or not it is impossible for anyone in London to say. The general opinion seems to be that it will be 'a near thing.' Assents have been coming in rather more freely the last few days and more are expected before this evening (the last day). On the other hand, several of the largest Ceylon Agency houses are holding aloof, and I have been at some pains to ascertain the reasons for this. One objection to the scheme arises from a doubt as to the integrity of signatures. It is asserted that anyone can drive a coach-and-four through the agreement, and doubtless there is some truth in this. Again, it is held in some quarters, that with the finer and more careful plucking now in vogue (of whi there is abundant evidence in the teas now arriving) matte will right themselves without any artificial combination. third party simply say that they signed the 1-lb. dra agreement, and with that experience will sign nothing more

We are not believers in the practicability of the ne scheme. To us, it is doubtful if sufficient producers wi join in and adhere loyally to the terms agreed upon. Eve should they do so, they will, in our opinion, merely help benefit those who do not sign. However, the attempt bring about an agreement having been made, there wi certainly be some evil results should failure result. Th Darwinian theory of the survival of the fittest is no generally accepted in regard to industries as well as plan and human beings. Yet this scheme ignores it. In fac the scheme may be said to embrace an appeal to the stron to be philanthropic and aid the weak, lest the latter b stamped out. It may be magnificent, but it is certainly n business; and in these days of intense competition te planting must be worked on business lines if it is to succee However, *nous verrons*. The tea-industry is in a bad wa It must be when trifles are commented upon as follows:- "A small scrap of comfort for tea-sellers comes this wee from Brussels. Since her severe illness recently, the Quee of the Belgians has found formal dinner parties too grea a strain on her strength, and she is now inviting all visito to afternoon teas, which accordingly are becoming the mo fashionable form of entertainment in Belgium in consequence Truly, a feather may sometimes be so handled as to sho which way the wind blows, but it is a bit uncertain in i records unless the wind, be steady, if not also strong. Mo encouraging is the news from the same source—the Londo correspondent of a Colombo paper—that in Paris Ceylon te becomes weekly more popular, and French ladies are a beginning to become customers. "All," though a sma word, has a potent meaning. The misfortune is that it is apt to be slipped in where its use constitutes an unpardon able exaggeration. We trust this is not the case now. At an rate, if it be not, restriction of output must soon give plac to increase of consumption, for all the ladies of France migh soon put a new face on the statistics of consumption.

UNWHOLESOME TEA.

The attention of Parliament has been drawn to allegation as to the import of inferior and unwholesome tea into Gre Britain. Some of this tea was even said to contain "micro bial products, dangerous to health." The Local Governmen Board, it appears, had no definite information on the subjec so we may presume that there has been some exaggeration Under the Sale of Food and Drugs Act, 1899, the Boar may in certain circumstances direct an officer to procu samples of tea for analysis. The result of the analysis is be communicated to the local authority, and thereupon becomes the duty of the authority to cause proceedings to b taken, just as if they had caused the analysis to be mad

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nicho son's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf peop unable to procure the Ear Drums, may have them free.

Address—No. 989 D, The Nicholson Institute, Longcott, Gunnersbury, *Londo*

[w. 26-5-00—26-5-1901.]

e Public Health Acts contain provisions under which icles of food, which appear to be unwholesome or unfit the food of man, can be dealt with by officers of local thorities. It is significant that the President of the Local overnment Board should have remarked :—"I am not at esent aware of sufficient reason for any such inquiry as at suggested." It is equally significant that Mr. E. H. rine should have taken the opportunity to write in dispraise much of the Ceylon Tea imported into England. As a ylon planter and a seller of Ceylon tea—Ah, well, perhaps e less said the better.

U. P. A. S. I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U. P. A. S. I.)

Selangor Planters' Association.

Indian planters will probably be interested in reading e following extracts (regarding Coffee, Rubber and Ramie) om the eighth Annual Report of the Selangor Planters' ssociation (for 1900) :—

There are now 69 Subscribing Members and Estates, all of whom e entitled to one vote, but some are entitled to more than one te by paying extra subscription if they have got the necessary reage opened.

At the end of the year under review, the cultivated area according all the returns that could be obtained, and estimating the area estates from which no returns could be obtained, is less by 473 res than that of the previous year, and on the back of this report a statement showing how these figures are arrived at.

Coffee.—Prices ruling during the year have shown a distinct improvement over those of last year and are as follows : January $20 per kul, February $22, March $22·50, April $21, May $20·25, June 2, July $22·50, August $22, September $21·25, October $19, ovember $19 and December $19 : an average of $20·89 per pikul, $3·69 per pikul higher than the average for last year. Prices re firmer at the commencement of the year ; but, towards the d, prices were dull and the market still remains so. The low ices, although better than those obtained last year, have necessited the strictest economy on all estates. Under these circumances your Committee consider that it is a matter for congratulan that estates are looking so remarkably well, and that the nters are showing such determination to do everything in their wer to tide over the present crisis.

The attempt to improve the quality of our coffee, commenced in 99, has been continued during 1900, and it can safely be said that e sample generally is better than it ever before was. During the ar five samples of sun-dried and machine-dried coffee were sent a London Broker by the Committee of the United Planters' sociation for report and valuation, with the result that such mples were favourably reported on, and showed a considerable provement in value on the Singapore prices for similar samples, d your Committee have followed up the action of the United nters' Association in obtaining promises of contributions from ates in Selangor to form regular monthly shipments to London : d we trust that this may lead to something substantial being ne towards shipping our produce direct to European Markets. show that it is realised how important it is that the quality of r coffee be raised to the highest standard possible. the fact may mentioned that three patent dryers have been added to those eady in use in the State.

As to the future of coffee in Brazil, a thing which closely affects oducers of it in every country, may be mentioned the following :— From the last report from Messrs. Rucker and Bencraft (Brokers), ted 29th November, 1900, it appears that exchange in Brazil at at time was $9\frac{15}{16}$d. as against $7\frac{3}{30}$d. at the same time the year fore, or practically a rise of 3d. in the Milreis, and from an exustive paper on the present condition of coffee culture in Brazil, itten by the Director of the Agricultural Institute of San Paulo, d sent to your Association by the Selangor Government, it pears that that official's opinion is that it is absolutely necessary to go in for manuring on a large scale if the former output of coffee is to be maintained, and in his summing up as to the future of coffee in that country, he says, that judging from the cost of production in Brazil it is evident that the situation of the present proprietors of estates is an extremely precarious one, and that the greater number of them will be obliged to sell their estates or give them up to the mortgagees. He points out, however, that the new proprietors would purchase cheaply and reduce the cost of production, so that the only thing that would prevent new proprietors from making a profit, and continuing to work the estates, even under present circumstances, would be a rise in the rate of wages or a decrease in the price of coffee. No doubt the substantial increase in exchange referred to above will have a serious effect. It must also be borne in mind that it is the general experience that, when estates are pushed to such extremes, the value of the same at the time of sale is reduced through neglect by at least 60 or 70 per cent of their former value.

Crops.—The crop for last year was estimated at 25,636 pikuls, which has been realised Crop for the coming year is estimated at 22,578 pikuls. See statement on last page.

Reports from London Brokers show that the largest crop Brazil ever gave amounted to 10,365,000 bags from 1st July, 1897, to 30th June, 1898.

BRAZILIAN RECEIPTS FROM 1ST JULY TO 1ST JANUARY.

	1900-1901.	1899-1900.	1898-1899.	1897-1898.
Rio bags ...	1,652,000 ...	2,110,000 ...	1,821,000 ...	2,759,000
Santos bags ...	5,409,000 ...	4,620,000 ...	3,802,000 ...	4,476,000
Together bags...	7,061,000 ...	6,730,000 ...	5,623,000 ...	7,235,000
Crop ...	... ...	8,971,000 ...	8,772,000 ...	10,461,000

From 1st July, 1900, to 1st January, 1901, the receipts were 7,061,000 bags, being only 174,000 less than on the record season 1897-1898. This would not look well, if it were not for the following statistics taken from—

"Return to an Order of the Honourable the House of Commons, dated 3rd August, 1900, for Statements showing the Imports of Tea, Coffee, etc."

PART II.—COFFEE.

TABLE I.

Comparative Statement showing the Consumption of Coffee in the Principal European Countries and in the United States in each year from 1884 to 1899 inclusive.

Years.	United Kingdom.	Russian Empire.	German Empire.	France.	Italy.	Austria-Hungary.	United States.
	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.
1884	32,256,000	18,288,000	244,438,000	149,411,000	35,825,000	78,100,000	508,633,000
1885	32,704,000	16,992,000	259,895,000	150,412,000	51,911,000	30,740,000	539,264,000
1886	31,584,000	16,488,000	271,988,000	150,308,000	23,872,000	82,720,000	537,212,000
1887	29,344,000	11,448,000	224,033,000	140,455,000	31,383,000	70,180,000	500,819,000
1888	30,576,000	14,004,000	252,248,000	149,600,000	30,859,000	75,900,000	108,563,000
1889	28,336,000	12,924,000	249,104,000	143,548,000	29,762,000	76,340,000	561,132,000
1890	28,000,000	14,076,000	259,877,000	149,406,000	30,760,000	77,220,000	490,162,000
1891	28,672,000	12,600,000	276,344,000	154,323,000	30,397,000	78,320,000	511,041,000
1892	28,224,000	14,256,000	268,470,000	158,072,000	30,437,000	80,740,000	629,672,000
1893	26,544,000	15,040,000	268,820,000	151,886,000	27,757,000	79,200,000	551,395,000
1894	26,544,000	14,688,000	269,188,000	153,556,000	26,891,000	82,060,000	547,069,000
1895	27,440,000	14,436,000	269,258,000	159,093,000	26,393,000	83,600,000	643,235,000
1896	27,328,000	13,860,000	285,773,000	165,405,000	27,740,000	86,900,000	572,672,000
1897	27,328,000	16,740,000	300,069,000	170,443,000	28,571,000	90,420,000	724,560,000
1898	27,664,000	17,892,000	337,194,000	174,691,000	29,462,000	95,920,000	851,691,000
1899	29,120,000	18,396,000	343,501,000	179,120,000	31,222,000	92,180,000	801,757,000

These figures show that the consumption of coffee in the principal European countries and the United States during the year 1888, was 961,750,000 lbs., and during the year 1899, 1,495,296,000 lbs., an increase of 533,546,000 lbs. during 11 years. During the same period, the rate per head of the total population has gone up from 2·66 lbs. per head to 3·77 lbs. per head. This is an enormous increase in consumption during 11 years, and it is a matter for consideration as to whether the acreage under coffee cultivation in the world can for long continue to supply this amount. Year by year estates become worn out and unremunerative—see report written by the Director of the Agricultural Institute of San Paulo, in which he states that about two-thirds of the acreage under coffee culti-

vation in Brazil requires manure and without manure it cannot go on producing large crops. This manure will have to be transported on an average more than 600 miles by railway, to say nothing of the cart transport.

Ceylon was once a great coffee-producing country, and for 20 or 30 years went on giving large crops without manure: but the time came when manure became absolutely necessary, and with manure came disease, and eventually total abandonment of coffee in the island.

Your Committee consider the above sufficient to stimulate you in continuing to keep your young and vigorous coffee in as good order as your finances will allow of, for we are in hopes that the days are coming, and perhaps not far off, when large crops will mean large profits.

Pará Rubber.—During the year the cultivation of this product has increased considerably, 1,146,870 seeds having been imported or obtained from local sources, all of which have been planted out in the field or in nurseries. It is to be regretted that seed imported from Ceylon germinated exceedingly badly; but, as hitherto, we are indebted to Ceylon for a large percentage of the rubber now flourishing in Selangor, we hope this will not occur again. Local seed gave an outturn of at least 75 per cent.

Termites still continue to be the worst pest which cultivators of Pará rubber have to deal with, but these have been, more or less, kept in check by various remedies.

Rambong.—The planting of Ficus elastica has occupied the attention of planters much more this past year than hitherto, 52,147 trees having been planted out. A sample sent by the Superintendent of Forests, Perak, to London was valued at 3s. 6d. per pound, and sold at 3s. 10d. per pound.

For further information your Committee refer you to the minutes of a General Meeting, held on 5th January, which have been placed before you. The year shows that Gutta rambong is likely to occupy the attention of planters more in the future than it has done hitherto, for although the largest operations are being carried on with Pará, there seems to be a tendency to extend the cultivation of Ficus elastica.

Ramie.—One estate is carrying on the cultivation of ramie in a praiseworthy way and we wish this estate all success.

Experimental Gardens.—The Government of the F. M. S. have appointed a Superintendent of Experimental Gardens, and your Committee are in hopes that he will as soon as possible make experiments in tapping rubber trees of different ages, and different kinds, and be able to give us some trustworthy information as to what yield we may expect from the different kinds of rubber, also that the Government will supply him with a Biffen separator which may prove of some use to him. We are also in hopes that Mr. Stanley Arden will devote a good deal of his attention to hybrid coffee, and that he will be able to instruct us on the best methods of destroying and keeping pests in check. As the planting of rubber has to some extent taken the foremost place in the attention of planters, a good deal of his time should be devoted to gathering and giving information on every branch of that cultivation, and his services in that direction will be most useful.

Statistics of acreage under Cultivation, estimated Crop and Labour employed on the European and other chief Estates in Selangor.

Tea Trade with Persia.

Referring to a paragraph in the proceedings of the meeti of the General Committee of the Indian Tea Associat (Calcutta) held on the 12th March, the Secretary

rculated for information, a copy of a letter, dated 14th ebruary, from the Kangra Valley Planters' Association on this subject. He remarks :—You will observe that the angra planters propose to send a caravan of 100 camels arrying 32,000 lbs. of tea from Quetta to Meshed. The ravan will start in June or July. And the Committee nderstand that should any other proprietors outside Kangra e willing to supplement the quantity specified the necessary rangements can be made. They accordingly direct me to k whether, in the event of your wishing to send any tea, ou will kindly give them particulars as early as possible f both the quantity and the quality.

The letter is as folllows :—

PALAMPUR, *4th February*, 1901.

rom

GERALD C. DUDGEON, Esq.,
Honorary Secretary,
Kangra Valley, Planters' Association,

o

THE SECRETARY,
Indian Tea Association.

At a meeting of this Association held in Palampur on the 13th stant, the Manager of the Bundla Tea Company handed in a letter, copy of which I beg to enclose, received by him from His ajesty's Consul at Seistan in reply to his enquiry concerning the troduction of tea into Persia. I am directed by my Committee place the same before you with certain suggestions which have manated from the consideration of it by them.

It will be seen that His Majesty's Consul at Seistan recom-ends the despatch of an agent with a consignment of 100 camel-ads to Persia in order to effect the introduction of tea from India á the new route. This project is considered feasible, and ar-ngements are in progress between this Association's Committee nd a local planter, well acquainted with Persian and Pushtu, to nvey and sell such a consignment in Persia, and to appoint agents, necessary, to ensure the permanency of the trade. It is under-ood that the Indian Tea Association may have in contemplation similar scheme, and it was therefore considered that it might be pedient for this gentleman to act for them also. Indeed the ommittee of my Association are desirous of offering his services, it is obvious that the elimination of competition in this trade an important factor for its favourable establishment.

The proposals which together with your Association's reply it is ggested should be put before a General Meeting of planters, are iefly that every garden in the valley should be invited to tender supply a quantity of suitable tea with samples to be submitted r approval to this Association's Committee. The tea will have be railed to Quetta. The expenses incurred for camel transport Persia, and the agent's remuneration and expenses will be pro-rtionally paid for by those whose tenders are accepted. The ofits upon the sales of the teas less a commission to the agent ll be made out separately for each contributing garden and paid on the termination of the expedition. It is estimated that 100 mel-loads would mean 32.000 lbs. of tea, but should the Indian a Association be desirous of supplementing this quantity, it uld be arranged for. It is probable that the whole 32,000lbs. uld be subscribed in this valley itself. In order to start a ravan of this description a certain amount of capital would be quired. This could be met by each contributor advancing a ed rate per lb. calculated to cover expenses, the alternative ing to borrow money from some bank or private individual interest.

SEISTAN-QUETTA, *17th November*, 1900.

rom

Major E. CHENEVIX TRENCH,
H. B. M Consul,

MANAGER, Bundla Tea Company,
Palampur.

In reply to your letter of 27th August only now reached me m being addressed Perisa and not Quetta. Seistan itself is a small place with no very large demand for tea or any other produce. The importance of Seistan is that it is the only province of Persia which is co-terminus with British India, and therefore commands the only land entrance into Persia which is opened to Indian traders. I need hardly remind you that every Persian drinks black tea, and that the tea comes from India either by Bunder Abbas, Mahomerah, Bushire, or round by Batoum. Green tea is drunk by the Afghans, and by the Bokhariots Russian subjects. It would be useless my sending you a sample of tea from here. Every kind of tea (Black) is drunk in Persia, the richer the Persian the higher is the price he will pay. I have not penetrated far into Persia yet, but shall shortly be going to Meshed as Consul-General, but I can say in a country like Persia it would be quite impossible for me to recommend any respectable Persian firm who would merely issue orders on you for tea. If you want to press Palampur tea on Persia your best plan is to send an agent; with a caravan of tea, say 100 camel-load, and let him sell in the different towns he goes to. I do not think there would be any chance of his not selling it well for the Persian greedily buys tea. This agent would either himself settle in the locality best suited to sell tea, or could appoint his own agents; in any case he could by advertising, encourage the Persian traders who are beginning to go to Quetta to buy your tea.

I never hold out any hopes to any person who is merely desirous of remaining stationary and accepting orders for tea obtained through the medium of a Consul. That course is impossible. No trade enterprise has been carried out in that way in any land. Take the history of China or India. Had English merchants at first waited until the Indians and Chinese went to them they might be waiting still.

Should you be unable to afford to risk a caravan of tea and learn the trade by practical experience. I shall be glad to receive samples of your tea done up in small packets, and labelled in English and Persian according to the attached form. This sample will be put in my show room at Meshed, and any Persian can see and order if he likes. I cannot be in any way responsible for Persian firms. One enterprizing firm at Baras is here now, and doing a very large and profitable business in ghee, wool, and tea, selling as far as Meshed, Bujand, and Herat. I am hoping Messrs. Lipton will come and thoroughly exploit the country besides many others. As regards the journey Seistan is 500 miles from Quetta by an easy safe road. Camel hire is Rs. 4-8 to 5-0 a maund from there to here and cheaper in Persia for the same distance.

Camels and transport are plentiful everywhere, five per cent. *ad valorem* is the duty chargeable on all imports into Persia, and may be paid in Seistan or Meshed. My advice to you is to come and see for yourself what Persian trade is like. Your agent must speak Persian; I am always ready to give you any advice on information.

* * *

Sale of Tea in India.

The Indian Tea Association (Calcutta) has issued the following circular, dated 4th April, 1901, to all Agents and Proprietors of Tea Estates :—

You will no doubt have observed from the recently published proceedings of the General Committee of the Indian Tea Association that this question has been engaging their attentive consideration.

2. At their meeting of the 12th March the General Committee appointed a Sub-Committee to examine the question ; to submit a definite scheme for developing the Indian market ; and to suggest an organisation to put the scheme into practical operation. The Sub-Committee have now submitted a preliminary report, a copy of which is annexed to this letter for your information. This report has been accepted by the General Committee ; and from it you will readily understand the nature of the scheme it is proposed to endeavour to put into practice

3. Briefly, the scheme may be described as one resting on a tea, rather than on a cash, basis. In other words it is proposed to ask all tea concerns to make over, without charge, a certain quantity of tea yearly, to an Agency which is to be

established. And the object of the present letter is to enquire as to the quantity of tea which Companies and Proprietors will be willing so to contribute.

4. The Sub-Committee anticipate that three, or four, or perhaps five, years will elapse before it will be possible to develop a large market. It will, therefore, be necessary for the Agency to be founded on such a basis as will enable it to carry on operations uninterruptedly for a term of years. And this can only be done by the industry undertaking to supply a certain quantity of tea annually.

5. During the first year of its existence it is believed that the Agency may be able to dispose of about two million lbs. of tea, or say, rather more than one per cent. of the Indian crop. If the business proceeds satisfactorily, this quantity, or perhaps something more, will probably be required annually.

6. I am accordingly now to ask if you will be good enough to inform the General Committee *at the earliest possible date* of the maximum quantity of tea which you will be prepared to contribute annually for say three years. It is of special importance that this information should be supplied promptly, because if a sufficiently large quantity be promised to warrant a start being made, steps will have to be taken immediately to engage a competent Superintendent or General Manager of the Agency. And this brings the Committee to an additional reason why it is essential that the contributions of tea should be guaranteed for a term of years. For it will be clearly impossible to obtain the services of a thoroughly competent man unless he can be given an agreement for probably five years. It must be evident to all that the success of the Agency will depend almost entirely upon the General Manager. And it is therefore of the highest importance that the terms and conditions of the appointment should be such as will secure a really able man.

7. It should be understood that the tea contributed will be required to be delivered free in Calcutta. The Committee are approaching the Inland Steamer Companies and Eastern Bengal State Railway with a request that it should be carried to Calcutta without charge. And they hope to inform you of the result in due course.

8. I annex a form of undertaking which should be filled in and returned to this office without avoidable delay.

Yours faithfully,

W. Parsons,

Secretary.

Annexures:—

(1) Form of undertaking.

(2) Report of Sub-Committee.

.....*April*, 1901.

To

The Secretary,

Indian Tea Association.

Sale of Tea in India.

Dear Sir,

I / We undertake in behalf of the..... .....

Company, Ld. / Estate, to make over without charge to the proposed Tea Distributing Agency.....lbs. of tea annually for the years 1901, 1902, and 1903 for distribution in India with the object of developing the Native market.

The tea to be delivered free in Calcutta.

Yours faithfully,

Indian Tea Association,
Royal Exchange Building.
Calcutta, 26th March, 190

Sale of Tea in India.

Preliminary Report of Sub-Committee.

To

The Chairman, Vice-Chairman, and
General Committee of the Indian Tea Association.

Gentlemen,

We, the undersigned, having been appointed a Sub-Commi to consider the question of increasing the sale of tea in India, beg to submit a preliminary Report.

2. In accordance with the terms of the resolution under wh we were appointed, we have confined our attention to the prepa tion of proposals whereby a definite scheme for increasing the of tea may be put into practical operation.

3. The scheme which we now put forward may be briefly cribed as one for the formation of a tea-distributing Agency. do not propose that tea producers should be asked to contrib money towards the cost of establishing and maintaining such Agency. But we suggest that they be asked to contribute tea.

4. As a preliminary measure therefore the Association sho we think, ask every tea producer in India if he would be willin make over, without charge, to the proposed Agency a cert quantity—to be determined by himself—of his production. offer might be for one season only, or it might extend over a num of seasons.

5. If, as we believe will be the case, a fairly large quantit forthcoming, the next step will be to make arrangements for e consignment to be valued by an expert on its arrival in Calcu The value would be credited to the subscribing Proprietor Company in the books of the Agency; in order that if at so future time it should be decided to distribute any assets or pro the distribution might be proportionate to the subscriptions of different Proprietors or Companies.

6. As soon as it becomes evident that a sufficiently la quantity will be given to enable a start to be made, we propose t a Superintendent, or General Manager, should be engaged. should be an energetic and capable tradesman, who has experience—in India for preference—of the work of advertis and pushing the sale of tea. The whole of the work of the Age would be carried on under his direction and supervision. head-quarters would be in Calcutta. And he might be made ponsible to a Board of Management, or Committee of Produce representing the subscribing Companies and Proprietors.

7. Under the Superintendent, at least two smart Europe travellers would be required. Their business would be to tra throughout the country on behalf of the Agency; to visit bazaars in the towns and villages; to induce the local dealers to t tea for sale; and generally to push the trade in every possible w

8. The staff in Calcutta would need to consist of a few Nat Clerks, and other Native Assistants. The latter would be mai required to pack the tea; and to see to the work connected w the receiving and despatching of it.

9. Office accommodation and godowns for storing tea would a be necessary.

10. The tea would be distributed by the staff in Calcutta to local dealers. Wherever possible cash would be obtained from latter; but if not, credit would be given. Possibly a number the dealers would not account for the tea sent to them. But nev theless, we think, that when the scheme is in good working or the receipts will more than cover working expenses.

11. The expenses connected with the initiation of the sche would be met from the Rs.50,000 to be contributed from American and Foreign Market Fund.

12. The foregoing is, in outline, the scheme which we sugg should be put into operation. There are many points of de connected with its working which will require considerati The following seem to us to be a few of the principal:—

(*a*) In addition to the chief towns and villages, the Age should work vigorously at railway stations, at mills, factories, c mines, and, indeed, at every centre where numbers of Nati congregate, or are employed. Railway stations we regard a special importance. During last year there were 162 millions passengers carried by the different Indian railways. La quantities of tea could, therefore, we think, be disposed of at

ading junction and terminal stations if arrangements were made sell tea in the cup, *i.e.*, brewed tea. To enable this to be done e Railways might be asked to permit stalls to be erected, and the cessary apparatus to be fitted. The stalls might be leased out contractors by the Agency.

(*b*) We understand that the Director-General of the Post Office clined a year or two back to allow tea to be sold at Post Offices the manner in which quinine is sold. But we note that there e no fewer than 7,672 so-called extra-departmental offices through-t the country. At all of these tea could be sold without the nsent of Government, precisely in the same manner as groceries, fancy goods, are sold at shop Post Offices in England.

(*c*) As it will be advisable to keep expenses as low as possible, e Railways and the Steamer Companies might be asked to make ncessions in the matter of freight. They might also be asked to ant free or at least assisted passes to the travellers of the Agency.

(*d*) As the consumption of tea in the countries beyond the orth-West Frontier is believed to be very large, we propose that e operations of the Agency should extend to Kashmir, luchistan, and, if possible, to Persia, and Central Asia.

We are, etc.,
D. KING (*Chairman*).
H. C. BEGG.
W. BROWN.
J. BUCKINGHAM.
W. T. CARTER.
H. R. McINNES.
SHIRLEY TREMEARNE.

THE PLANTERS' ALMANACK.

In quoting the following extract from the *Brazilian Review*, venture to express the hope that at least one planter in ch of the Tea and Coffee districts of Southern India will lige us by compiling a similar almanack in regard to one of ese products.

January.—Plantations are weeded and the ground prepared for wing beans. Very hot days occur (veranico) generally injurious the berry. Calculation may be made of the crop this month.

February.—Weeding continues and cereals are sown.

March.—Weeding on the lowlands (terras quentes) should be mpleted to allow picking in April. Second weeding takes place "terras quentes." Washed coffees commence to appear.

April.—Coffee picking commences on "terras quentes." Heavy ns this month make the coffee ripen too quickly.

May.—Picking continues on "terras quentes" and harvesting of rn and beans commences. Rainy weather in this month is urious because it develops too early flowering with berry on es and weakens them.

June.—Cold and damp is occupied exclusively in picking coffee. thing should be sown this month. All kinds of cereals are rvested and undergrowth cleared. A good time to cut timber. ffee and Rubber seasons end on 30th June.

July.—Picking should be finished this month before the trees gin to bud. Frosts commence. New Coffee and Rubber seasons nmence on the 1st July.

August.—Trees commence to bud for September flowering in "ter-quentes" and in October for "terras frias." Ground is prepared sowing cereals; weeding coffee proceeds and coffee, now well ed, commences to be sent to market. This is the worst month for st and the most injurious. Sugar season ends at Pernambuco.

September.—Second picking of coffee on "terras frias" is com-nced, called "café das aguas." Third weeding continues in rras quentes" and milho and other cereals are planted. Rainy son commences. On well treated plantations first flowering. in during the month previous to the second flower is desirable, it develops the flowering. Sugar season commences at Pernam-co and Northern States on the 1st of this month.

October.—Weeding continues on coffee and cereal plantations "terras quentes." Picking finishes in "terras frias" and drying nmences. First flowering on "terras frias" and second on rras quentes," this determines the ultimate crop.

November.—Third weeding.

December.—Second heavy flowering in "terras frias" and third "terras quentes."

NOTES.

Green Tea in the U. S. Mr. Wm. Mackenzie cabled on 27th ultimo from New York :—"Green prospects are more favourable."

Cinchona in Amsterdam. A supplementary catalogue for the Amsterdam bark auctions, to be held on Thursday, March 28th, showed that 6,899 packages would be offered, containing 624,980 kilogrammes (about 1,374,956 lbs.).

Indian Tea for Indians. The *I. P. G.* holds to the opinion that the creation of a taste for tea among the masses must be first attempted by the sale of the infusion rather than by that of the leaf. It would certainly be a great thing if "tea-stalls" could be established side by side with "opper" depôts !

Tea in Sylhet. Calcutta news, dated April 4, says : —In South Sylhet last night there seems to have begun a break in the long drought : half an inch of rain was registered. This is not of much use in the present parched state of the ground, but the cloudy gloomy atmosphere presages more.

Their own Wallets. "It is all very fine," says the *I. P. G.*, "for our local papers to grid at the Ceylon and South Indian planters for sending out refuse tea for local sale and even export ; but what about our own damaged and re-packed ? Hardly a sale passes during the monsoon without several chests being put up under the above denomination."

The London Tea Market. Cabling to Colombo on the 2nd instant, Messrs. Gow, Wilson & Stanton reported that the market generally was steady. The price of fair liquoring Ceylon Pekoe Souchong was 5½d (¼d up) and the average price of Ceylon tea sold on garden account this week was 7⅜d (also ¼d up)—as against 6½d and 7½d respectively in the corresponding week last year.

Indian Tea for Tibet. It is reported that traders are declining to take sample trees of Indian tea into Tibet, fearing punishment from the Lamas. This has reference to an important experiment recently made by the Korb of Kalimpany with a view to the introduction of Indian tea into Tibet. The Lamas have a monopoly of Chinese weak tea and are quick to resent competition. However, Indian tea-planters should do as Bruce and the historic spider did : Try, try, and try again.

The Value of Tea. The *Pall Mall Gazette* states that the capital of fifty Companies has fallen in value from 10 to 7½ millions sterling since the middle of last year, and holders of shares, who have already had much cause for anxiety, view with dismay the statutory increase of wages for an immigrant population, which lives and saves upon the present rate and has settled upon land of its own in Assam upon the expiry of its contract period in large and increasing numbers.

Colombo Tea Sales. The last tea sale before the Easter holidays was held at Colombo on the 2nd instant. The sales will not be resumed till Wednesday,

the 17th instant. About 16,832 packages = 1,297,052 lbs. were offered, of which about 10,494 packages = 826,634 lbs. were sold. Owing to the large quantity offered and the short time available for tasting, there was a great disinclination on the part of buyers to operate. Consequently prices were very irregular, and in many instances showed a marked falling off.

Indian Tea for Indians.

The Indian Tea Association has received undertakings in India representing a reduction of 3½ million lbs. A scheme for pushing the sale of tea amongst the population in India, by means of a special distributing agency under the direction of a superintendent, has been recommended; also that brewed tea be sold at all railway stations. The operations of the agency to extend beyond the frontier and in Baluchistan and Persia. The Committee has cabled to London to allot Rs.50,000 from the Foreign Market Fund for the purpose.

Sir Thos. Lipton.

The great tea boomer has passed from knighthood to knighthood, having now been gazetted a Knight Commander of the Royal Victorian Order. *A propos* of this, the *World* writes under the head of a provisional "Order":—

[A knighthood of the Royal Victorian Order has been conferred upon Sir Thomas Lipton.]

This honour new to Lipton paid
Seems of the wrong degree;
If he "Lord Bacon" can't be made,
Why not at least "K. T." (ea)?

New Plants??

The *Ceylon Observer* publishes the following letter concerning "The Ruby, Sapphire, etc."

London, W., *March* 12.

Dear Sir,—By this post we are forwarding you two copies of the "Mining Journal" containing articles on Corundum Gems—Ruby, Sapphire, etc.—by our Mr. Leopold Claremont. As many of your Ceylon readers are interested in precious gems we shall be happy to place them at your disposal for reprinting.

pp. CLAREMONT & WARD,
J. W. Purkis.

Our contemporary remarks:—"These interesting articles will be duly reproduced in our *Tropical Agriculturist*." We may fairly ask:—*Que vont ils faire dans cette galère?*

Indian Tea for Indians.

The sub-Committee of the I. P. A. (Calcutta) suggests in its preliminary report that producers should contribute a certain quantity of tea yearly for distribution throughout India by a special agency controlled by a superintendent or general manager; that travellers should be employed to push trade, mainly by the native dealers in bazaars who brewed teas, and should be sold at railway stations, also at so-called extra departmental Post Offices. The operations of the agency should extend to the north-west frontier, including Baluchistan, Turkistan, and Persia. Sanction to spend Rs.50,000 from the American and Foreign Markets' fund was asked for by wire from the London Committee.

Rubbish or not?

An "Old Merchant" sends the following pithy remarks to the *Ceylon Observer*:—"As long as an article is not injurious to health, it is legitimate to trade in it, as we see in the thousands of instances that occur every day. I remember very well when in 1898 some common tea was called 'muck'—yet when that tea, the following year, advanced 2d per pound, it was called capital tea. Tea that sold in large quantities t weeks ago at 2½d per pound, was sold six months ago at 2 —of course, it is now called rubbishy tea—and high coun planters want its export to be prohibited!—because it injurious to health and not fit for human food as the Aust lians say, and as the Americans said of broken Pekoe, beca it contained so much small and broken leaf."

Planting Prospects in Ceylon.

The following is a comparat statement of the Chamber of Co merce figures of shipments to U. K. for the first four months of the last three years. T discloses a favourable condition of things when it is rememb ed that last January's shipments were abnormally swol by December teas:—

SHIPMENTS OF CEYLON TEA TO THE UNITED KINGDOM.

	1899. lbs.	1900. lbs.	1901. lbs
January	6,860,166	10,477,132	12,617,510
February	7,816,499	8,490,967	8,333.266
March	8,589,706	10,578,085	7,683,801
April	8,284,687	8,924,218	9,000,000
Total for 4 months ...	31,551,058	38,470,402	37,634,577

Coffee in the U. S.

Thus the *American Grocer* of 6th ultimo:—A very strong mark wholly due to speculative influence. There has been act trading in futures. The deliveries indicate a light consum tion, and are behind last year at this time. The outlook for the greatest crops ever harvested, but, in spite of hea supplies, strong outside interests have taken hold of coff No. 7 Rio has sold on the spot at 7⅝c, No. 3 at 8⅝c, a No. 5 Santos at 7¾c, c. and f., and 8c spot asked. A s of 10,000 bags, delivery in March, 1902, was made on Exchange at 6·70c. On Tuesday a weaker tone develo and prices reacted ⅛c on spot. The price of package co was advanced to 12½c list, or 11c net, for "Lion" a "Ariosa" brands. A slow trade in mild sorts, with quotati well supported. Padang Interior held from 17½ @ 20c, w fancy mats at 27 @ 29c, and possibly higher for extra f lots; Mocha, 16 @ 19c, and better for fancy; good cucu 9c; best washed Merida and other Maracaibo sorts, 12 12½c; Bogota, washed, 10 @ 16c; Bucaramanga, wash 10 @ 16c; Central American, better grades, 9½ @ 1 Mexican, washed, 12 @ 14c for best.

Cinchona.

The London correspondent, of *Times of Ceylon*, offers a word the wises. He says:—"At the bark sales this week pri showed an advance, and the unit is now quoted at 1 Since the sales the tone has not been so buoyant, owing the large shipments for the half month cabled from Ja As quinine is being again "talked up" in some quarters may be well to recall what took place two years ago, and utter a word of warning. At that date quinine, which h rapidly risen from the neighbourhood of 9d an ounce, v being boomed. There was no solid foundation for the ri but the mere fact of so many silly people (of whom I v one,) rushing in to buy in itself put up the price, which r to about 1s 10d. Most of us, I need hardly say, got in n the top. When the supply of buyers stopped, down went price, which sank to 10d again. Some cut their loss getting out at 1s 6d or 1s 3d. Others, greatly dari bought more at low prices to "average" and still hold stuff. The quotation is now about 1s 3½d, and if it suits

rposes of the ring who control the price to a great extent, may go higher for a time. I could tell many painful ories of the losses sustained by Ceylon men, not in quinine ly but in all sorts of speculative schemes here in London, r can I recall more than one or two instances, and those ry doubtful ones, of men who have done any good for emselves by hasting to be rich. Believe me, the planter is match for the plausible professional who takes care that comes out on top, whatever happens. I learnt this lesson ry early in my residence here, and to anyone who is mpted to speculate by the promise of a high return I ould say 'Don't'."

dian Duty on Ceylon Teas.

Mr. H. Drummond Deane, of Peermaad, writes to the *Ceylon Observer*, that it seems to him that the "extraordinary remedy" suggested—the imposition of a reciprocal x by the Indian Government on Ceylon teas imported into dia—is one that Indian planters may sincerely pray for. e adds:—"Unfortunately I fear that the Ceylon Government ould not be disposed to play into Indian planters' hands, thus increasing the cost of your production, which such tax would necessarily mean. The abolition of the rice tax Ceylon, the main food of the people, is what most people ould like to see brought about from humanitarian grounds, d I am one of the many of that way of thinking; but, Sir, the case of a tax being imposed on Ceylon tea into this untry we merely get the same protection from Ceylon mpetition, as you have got (and still advocate as being just d expedient) from Southern India teas. With a similar x to the Ceylon one of four annas, the million and odd ounds of what are probably mostly very common teas that w find their way chiefly to Bombay from Colombo would ve to find other markets, and Southern Indian planters and en Northern Indian planters would at once benefit by the hole of that amount. In the expressed opinion of Mr. krine, Mr. Campbell, Mr. Thomas, and others, one of the ief *raison d'etres* of the Ceylon tax is to keep us Southern dian planters out of competition with Ceylon. Why then e we not in our rights in demanding protection for ourlves? I believe myself that we shall in time not only ask r but obtain a reciprocal duty on Ceylon tea, until such time Colombo is made a free port for our produce." Our Colombo ntemporary replies with a question:—Are Southern Indian anters prepared to contribute to the Ceylon tea cess on all as shipped from Colombo?

GENERAL ARTICLES.

BRAZILIAN NOTES.

(From the *Brazilian Review.*)

São Paulo.—The *Municipio* of São Manoel do Paraiso states that e plantations in that district suffered no damage from the late avy hail and rain storms.

Heavy rains have fallen in Jundiahy, Figueira and Itatiba.

In Espirito Santo dos Turcos the coffee is said to be abundant. he crop will be early, as the berries are already ripening.

The Secretary of Agriculture has declared, with reference to the le recently made by the Sorocabana & Ituana Co., limiting the eight of bags of cereals presented for despatch in its stations, at shippers may forward packages of any weight or capacity hich suits their convenience.

In São João da Boa Vista a *fazenda* worth 32:000$ has been sold auction for 6:000$000.

A number of Campinas *fazendeiros* intend asking the Government to assist them in introducing Japanese immigrants for work on the plantations in that district.

Exchange.—*Saturday, February 17th*, 1901.—Ninety days rate on London opened on Monday the 11th at 10 1/4d. and closed this evening at 10 19/32 d.

Throughout the week rates have inclined to boom and selling for the next three months has been heavy. There can be no doubt of the feeling of the market but though the rise, and a considerable one, is bound to come sometime, it seems rather early yet to begin anticipating coffee entries.

26th February.—Extremes during the week ending February 22 were 10 1/2—11 3/16 d. for 90 d/s Bank paper and 10 19/32 — 11 5/16 d. for private. The average Bank 90 d/s counter drawing rate for the week comes out at 10 3/4 d. the corresponding sight rate being 10 11/16d, against 10 25/32d. the average sight rate of the *Camara Syndical.*

Santos, February 23rd, 1901.—90 days' Bank rate opened at Rio on Monday 18th at $10\frac{9}{16}$ d., rose to $11\frac{3}{1}$ d., on Thursday and closed this evening firm at 11d.

A rise of almost a penny in twelve days, and that at the tail end of February, without outward or visible rhyme or reason, is enough to stagger even the lamented Mr. Thomson and make the hair stand on end of the very deer he is popularly supposed to be chasing over his native heath. But as it went up so shall it come down, because there is no sense in it, anyhow, and great shall be the fall thereof.

It is interesting to get away for awhile from the hub of the Universe in the Rua da Alfandega and hear what others think and say of affairs, and, if laid to heart, instructive. Here at least they do not think much of our little Rio ways and protest energetically against the iniquity of allowing wicked outsiders to interfere in so virtuous and proper a market.

When exchange is going up it always seems quite right and proper and that it would never stop; but although we are only present in the spirit, we have no doubt that the sanguine *Fluminense* is already totting up the value of stocks and discounting the coming crop, Sorocabana Railways, Melhoramento loans and other waifs and strays, in his endeavour to prove that the rise is legitimate and that two and two make five, just as he did under the Thomson dispensation and will do whenever it suits to "bull" the market.

There is, however, no possible sense in such a rise as has been engineered this week, with the value of coffee shipments on the wane and remittances on the increase. The best that could be looked for was a steady rate during February and March, with an improvement, perhaps, in April in anticipation of the new season. But the attempt to boom things now is altogether premature and bound to end in reaction and disaster, unless backed up by some outside factor of which the public is unaware, and on which there is no ground to count positively. The Santos market, anyhow, has not accompanied the movement nor believed in it, selling only from day to day for its own requirements; nor is it likely that with coffee prices so low as they now are, that there will be any disposition to sell coffee in advance. Where jobbers are to find cover for the heavy selling for delivery during the next three months unless assisted by Santos shippers is hard to say, as both prudence obliges merchants here to be careful and interest to be "bears." Immediately rates weaken bills disappear from the market as by enchantment and a "bear" reaction sets in.

The contest which is fought out year by year between Bills and Money is being rapidly converted into a struggle for supremacy between Santos, the great producing centre, and Rio the consuming and speculating market whose interests are necessarily antagonistic, or at least appear so.

Which will get the best of it, Rio, the "bull," or Santos, the inveterate "bear"?

Last year, no doubt, the "bull" had the best of it because the factors were favourable for a rise throughout. Not only did coffee realize a higher average value than there was any reason to anticipate and largely augmented the supply of bills, but unprecedented monetary stringency so restricted demand that money kicked the beam and up went exchange.

At present prospects are very different. A much larger crop is likely to be sold at much lower prices than last year, whilst foreign obligations will receive a considerable addition. It is true that the stringency of money is increasing, if anything, but is that alone

sufficient to counteract the possible deficit in the supply of bills? Will coffee give nearly £20,000,000 this year as it did last? That is the question that must be answered before conclusions can be reached.

Supposing that the most sanguine estimates of 12,000,000 bags for the whole crop (Rio, Minas, S. Paulo, Espirito Santo and Bahia included) be realized and that it fetches on an average 30 shillings per bag f.o.b., in that case the supply of bills from this source cannot exceed £18,000,000 and compared with last year, will give a deficit of £2,000,000.

There is a great deal of talk of American and French Syndicates operating for a rise and, though it is possible their buying may maintain rates for a time, in the long run the effect of commencing a record crop with such enormous stocks cannot fail to make itself felt. A good deal of trust is also placed in the apparent tendency of foreign prices to follow exchange; but that, in our opinion, can be but momentary so long as the minimum price is not attained by which supplies would be affected.

Returning to the immediate market offers of tobacco bills from Bahia have been a decided feature. Money, it appears, is still so scarce at Bahia that bills were offering eagerly at 11d. when Bank paper was quoted here at 10 7/8d. The Bahia season is usually sharp but short, tobacco bills being exhausted in less than a month. Take it as we may, a rise so violent seems at this season wholly unjustified and bound to bring its own punishment, but, at the same time, it is requisite to bear in mind the fact that the Bank of England rate is down again to 4 per cent, that "Brazilians" are being actively boomed and, finally, that advantage is certain to be taken of such circumstances to endeavour to work off some of the undertakings that have been waiting for months for a chance. In case of success it is likely that, under present circumstances, the effect would be very pronounced. Anyhow, the facility with which the rise was worked shows how extremely nervous the state of tension is and counsels the greatest prudence.

THE TEA TRADE.

FEBRUARY STATISTICS—PROSPECTS OF RESTRICTED PRODUCTION.

[By an Expert Correspond ent.]

The Board of Trade statistics of the imports and exports of tea and the quantity on which duty payments have been made for the first two months of this year are quite as interesting as any previously dealt with. I compare the import payments with those of 1899 to show the quantity taken out of bond in excess of the normal quantity in anticipation of a further increase of duty:—

IMPORTS.

	1901. lbs.	1900. lbs.
From China	2,469,341	3,674,728
India	34,137,154	29,935,902
Ceylon	21,954,006	21,379,491
Other countries	2,396,266	1,686,149
Total ...	60,956,827	56,676,270

QUANTITY PAID ON.

	1901. lbs.	1899. lbs.
On China	2,610,417	2,441,586
India	50,833,954	23,418,556
Ceylon	22,744,397	12,288,155
Other countries	1,480,420	751,801
Total ...	77,669,188	38,900,097

EXPORTS.

	1901. lbs.	1900. lbs.
Of China	2,144,478	1,942,153
India	2,419,432	1,425,838
Ceylon	2,583,392	1,767,600
Other countries	289,553	117,850
Total ...	7,436,855	5,253,441

Stocks in bond, 28th February, 1901, 97,479,000 lbs.; 28th February, 1900, 102,308,000 lbs.

The returns do not give the quantities in bond from the different countries, and it is desirable that they should do so, as the statistics of the Tea Brokers' Association are not always reliable. T exports, especially to the United States and Canada, continue o very satisfactory scale, indeed, induced, no doubt, by the very l prices of the common but useful descriptions. The increase in imports is again nearly all from India It is now evident that l year's crop will be about 11,500,000 pounds in excess of the previ one and about 4,000,000 pounds more than the estimate of Indian Tea Planters' Association. The duty payments, it will noticed, are on about 40,000,000 pounds over the usual quanti we shall therefore witness another year of disorganisation in trade, unless it is counteracted by the steps being taken to cur production.

ALTERNATIVES TO LARGER TEA DUTY.

In my article last month I suggested that by imposing moderate duty on sugar the Chancellor of the Exchequer co exercise the power of turning the tables on Budget anticipators, a of relieving the tea industry of a portion of its intolerable burth I venture now to make another proposition. Why should not import duty be put on petroleum? The commodity is not produ in this country; there can therefore be no question of that bugb Protection. We annually import 1,000,000 tons from America a Russia, and a duty of only 10s per ton wouldy ield £500,000, eq to ½d per gallon. Such a duty would not only be far-reaching, would fall, imperceptibly, chiefly on those who contribute compa tively little to the present extraordinary expenditure of the count The object of suggesting new and equitable sources of revenu to enable the Government to adjust and equalise oppressive dut on other articles, such as tea.

PLANS FOR CURTAILING YIELD.

The amended plan of the Committees of the Indian and Cey Planters' Associations for reducing the output of British gro tea being of a more elastic nature than the original one will. I h good reason to believe, be acted upon by nearly all growe Planters have now the option of either restricting the pluck area or of reducing the yield by finer plucking. Ceylon growe as I have already pointed out, are losing money in all cases wh the price of their tea does not average more than 5d per pound, a they have no option but to adopt finer plucking. I learn, too, t a very large number of those whose tea averages even 6d per pou have also decided to adopt the same course. An illustration of advantages of finer plucking, as compared with a restriction area, which has just come within my own experience, will obvi any surprise there may exist for the preference for the quicker a more effectual method of curtailing the output.

ADVANTAGES OF FINER PLUCKING.

During the last few weeks a considerable quantity of tea fr the estates I am interested in has been sold at an average of per pound, entailing an absolute loss of 1½d per pound. My presentative in Ceylon, for seeing this result when the sudd slump in quotations began, commenced at once to pluck finer. T first shipment of this tea has just arrived. The brokers repor to be of good quality, and value it at 55 per cent. more than wi was previously imported. A loss of 43 per cent. is thus conver into a small profit, even at the present unprecedentedly low rat The cost of cropping the smaller quantity is naturally largely creased, but this is nearly all compensated for by saving in ma facture, packing, transport, freightage, and warehousing charg The original plan of contracting the cropping area by 10 per ce is being quietly forestalled by abandonment of cultivation of portions of estates where the yield does not remunerate at pres prices. This abandonment of cultivation does not mean extincti Weeds do not kill the shrubs as in the case of coffee, and when c cumstances warrant they can be brought again into production a cost of £2 or £3 per acre.

WHEN THE EFFECT WILL BE FELT.

The effect of the adoption on a large scale of the plan for c tailing production cannot be very apparent for some time to co and it may probably be June or July before it has any pronoun effect on quotations. It must not be forgotten that the Indian c does not begin to arrive before July, and therefore any restricti of yield from that country will not be felt until then. Still, the i proved tone of the market during the past two or three weeks, face of the unsettled state of the trade, owing to the accumulat of duty-paid stocks, proves that dealers are not shutting their e as to what is being done in Ceylon, and will from the same cau be done in India when the time comes.—*Financial Times.*

FACTS ABOUT CACAO.

The following extracts from the Administration Report, nd sub-reports, recently issued by the Director of the Ceylon otanical Gardens, for 1900, will prove of interest to planters. he Director quotes as follows in his main report :—

CACAO.

The Assistant Director, who now takes charge of all matters nnected with this product, reports as follows :—

"The exports for 1900 show a considerable decrease, from 42,745 vt. to 33,476. This, however, may be explained in a variety of ays. The year from January 1st to December 31st is not the est period for a record of cacao yield, and it is probable that the ckings of the last few weeks of the year and of the first weeks 1901 will, to some extent, make up the deficiency, the crop in 1900 aving been later than usual. That the canker of stem and pod nd the attacks of Helopeltis, etc., are a factor in lessening the ield, is no doubt true, but a large diminution in fruit crop has ccurred in trees which have no disease. In fact an unusual umber of dull and rainy days in some cacao districts has told gainst the production of fruit and in favour of the blackening of ods and the growth of canker. The prices which have been btained for Ceylon cacaos show that the quality of our cacaos is ill up to a high level, and encourage cultivators to devote atten- on to further improvements of their methods of curing The anker and blackening of pods still causes a serious diminution of rop on many estates where little or no care is taken to combat ese evils, but where preventive and curative treatment is oroughly carried out a marked decrease has resulted, and in me cases estates which two or three years ago were seriously andicapped have been almost entirely freed from the disease. ocal attacks of Helopeltis on the pods have been more virulent an usual. The cacao industry will, however, be benefited by ese evils to some extent, as they have undoubtedly led to more anitary methods of cultivation, and such advances, as well as forts to improve our varieties by selection and other means, tend to an increase of profit from this fruit tree, which grows vigorously in different climates in Ceylon."

EXTRACTS FROM THE ASSISTANT DIRECTOR'S SEPARATE REPORT.

From Mr. J. B. Carruthers' own report we take the following :—

Several inquiries relating to cacao canker, *Nectria* sp., both on em and pods, have been received and advised on. In more than ne case it has been sent as an entirely new disease which has not een noticed or heard of by the cultivator before. The life-history f the canker having been worked out and the methods of counter- cting its evil effects having been laid down, and during the last wo years carried out with a large amount of success, it is most mportant that all growers of cacao, either European or native, hould be on the constant lookout to detect the first appearance of his fungus and take steps to get rid of it before any serious loss as accrued and its removal becomes a more difficult and costly natter. Their neglect is also a serious injury to other cacao lanters.

A good many matters relative to the cultivation of cacao and its nprovement have been investigated and are still being worked ut. Two of the most striking things in the cultivated varieties f cacao are the amount of blossom produced in relation to the uit ripened and the number of small fruits, from half an inch to our inches long, which die off without being attacked by any pecific disease.

In some cases the weight per tree of these withered fruits has een found equal to ten to twelve ripe pods. This waste energy is early a disadvantage to the attainment of greatest profitable ield in a cacao tree.

The fertilization and subsequent ripening of the fruit in cacao therefore a most important question. The method of pollination not thoroughly known, and with this in view the flower is being tudied ; when the method of pollination is discovered some ex- eriments will be initiated to endeavour to produce an increased rtilization.

A cacao tree has been under observation at Keenakelle, Badulla, evation 3,800 ft., of the Caracas variety, but not very typical— robably a hybrid which has for the last five years borne an verage of 434 harvested ripe pods per annum. The tree is about 7 years old, 22½ feet high, with a spread of 30 feet, and an abnor- ally abundant leaf production.

The propagation of cuttings from this tree has been tried, but so far without success, and a series of experiments as to the best method of striking cacao cuttings is in progress. However, any experiments in this direction by planters or others which add to our knowledge will be welcomed, as the ability to perpetuate the characters of any specially fruitful tree would be of great economic importance.

198 seeds from eight pods on this tree were sown in an experimental plot. Each seed was weighed, and those above the average (weight 3·4 grammes) were placed in one-half of the plot, and those below the weight in the other half. The plots were further divided into beds according to the pods from which the seeds came, the shape, size, weight, and thickness of wall of the pods being recorded. By this means data will be gained which will show the best directions in which to work in selecting cacao fruits for seed.

For the same reasons a large number of cacao pods have been examined, measured, and weighed to find out what relation, if any, there exists between the size and shape of the pod and the number and weight of the seeds it contains. So far as the investigation has gone no such relationship has been found to be constant, the size of the pod in many cases being simply due to a thickening of the fruit wall, and in many cases the largest pods contain fewer seeds than are found in smaller fruits, but a definite conclusion connot be formed until a much larger number of different pods have been so examined.

Experiments as to the fermentation of cacao seeds before drying have been made with a view to finding whether the process can be accelerated with good results, and these will be carried on as far as possible.

PARAGRAPHS FROM THE ENTOMOLOGIST'S REPORT.

In September last Mr. E. E. Green paid a vist to Kurunegala, partly to visit a cacao estate suffering from an attack of *Thrips*, and on this subject, and *Helopeltis Antonii* (Signoret)—sometimes called Mosquito Blight—which has troubled cacao as well as tea, he writes thus :—

The *Helopeltis* insect attacks the cacao plant in a different manner. Though there is occasional injury from the puncturing of the young cacao leaves, the principal damage is confined to the pods, which are often so badly punctured when quite young that they are unable to develop properly, or may even be killed outright. I have suggested the spraying of the young pods, at the time when the eggs of the insect are being deposited, with Macdougall's solution or some similar insecticide. This treatment is now being carried out on a few estates with apparently good effects.

Thrips.—A serious attack of Thrips was reported from Kurunegala District in September The species appear to be the same as has been recorded from the tea plant, but in this case it was injuring cacao trees. I made a personal visit to the estate in question, and found the damage had been really severe. The insect is a most minute one, only just visible to the naked eye. But the work of myriads of individuals results in an excessive loss of leaf and endangers the safety of the crop. The symptoms of attack are a yellowish blotchy appearance of the upper surface and a brownish discolouration on the under surface, which is also covered with small black spots due to the deposition of the excreta of the insect. No eggs could be found ; but on crushing the body of the female insect and examining it with the microscope a powerful serrate ovipositor is noticeable, which suggests a probability of the eggs being embedded in the tissues of the plant. It is probable that they are deposited in the younger leaves after these have attained their full size, but before they have become hard. On such leaves the adult insects are found, but few, if any, of the immature individuals. The actual injury to the leaf occurs after it has reached maturity. It was most noticeable that plants growing under dense shade were less affected by the pest than those in more exposed situations. It was also apparent that hardly hybrids, when once they have reached the fruiting stage, are able to withstand the attack very much better than do the old red varieties. The young hybrid plants do not share this immunity, and often succumb to a bad attack. On this account, although it would be quite impracticable to treat a large area, with many trees over 20 feet high, attention may be given to the supplies with great benefit, to enable them to reach the immune stage. Such supplies might be sprayed with any of the soapy insecticides in the market. It may be necessary to repeat the treatment at intervals during the critical period.

COFFEE IN BRAZIL.

The Boletim da Agricultura of São Paulo publishes statistics relating to the Municipal districts of Aracariguama, Atibaia, Bananal, Pilar, Sertãozinho and Villa da Redempção, which summarized give the following results:—

Number of plantations ...		466	
Area of do	Alqueires	62,987 =	Acres 319,444
Area of do under coffee ...	,,	11,127 =	,, 56,414
Area of do not under coffee ...	,,	19,665 =	,, 99,651
Total number of trees ...	...	22,944,188	
Trees 4 years and upwards ...	...	15,116,188	
,, less than 4 years ...	...	7,828,000	
Hands actually employed ...	...	13,919	
,, wanted	...	4,748	
Extra hands employed at harvest	...	10,034	

From this it would appear that one hand can care and work about 1,300 trees of which 1,000 in full bearing and the rest under 4 years, and that 1 extra hand is required per 1,500 trees in full bearing at harvest time. Supposing that all these hands employed were male adults earning, say 2$500 per day or 70$000 per month, including keep, the cost of labour would be 11,69 ,960$ for maintenance, and 2,107,140$ for harvest, in all say 13,800,000$. At an average of 80 *arrobas* per 1,000 full-bearing trees, the aggregate yield would be 1,209,288 *arrobas* of 15 kilos and the cost of labour work out at 11$400 per *arroba*. Evidently there must be a mistake somewhere, as with coffee selling at 9$000, it is quite impossible that labour should cost 11$000 per *arroba* or anything like it. The mistake must be either in the number of hands employed or in the estimated number of trees.

A Coffee Exchange.—A project for the monopolisation of coffee shipments under the guise of a coffee Exchange has been presented to the President fathered by the *Centro Commercial*. This Association has done such excellent service in defence of commercial interests as to make it a matter of regret to find a project of so retrogade and illiberal a character under its protection. We have not time at present to give the scheme *in extenso* but its principal clauses embody a scheme for the complete monopolisation of the coffee export trade that under no possible curcumstances could we recommend. It does not seem likely that a measure so illiberal and anti-republican will ever receive the serious attention of a Government or that Government would ever assent to stretch its prerogative so far as to put it into practice, as is proposed, without the previous consent of Congress. In our next number we propose to give the project in detail.—*Brazilian Review.*

THE POSITION OF PLANTERS IN BRAZIL.

In a sensible letter addressed to the *Estado de S. Paulo* Dr. Adolpho Pinto, general manager of the Paulista Railway, urges planters to look the situation fairly in the face and acknowledge that the depreciation of coffee is the exclusive effect of "overproduction."

"In spite," he says, "of consumption having reached 14,700,000 bags *per annum*, this year's production will probably exceed it by 300,000 bags, and the situation become unfavourably if not absolutely desperate. In face of such figures, it seems likely that prices will continue weak until September, when their course must depend chiefly on the prospects of the crop for 1902-1903, as regards which it is reasonable to conjecture that the trees weakened by heavy crops and insufficiently tended in consequence of the lack of labour, will produce much less coffee in 1902, probably under 10,000,000 bags, in which case the world's production will reach at most 14,000,000 bags and, falling below consumption, provoke a rise of sterling prices.

It is not the status of coffee in the world's market Mr. Pinto thinks to be so serious, but the lack of labour on the plantations in consequence of which he says "there is not a plantation in all the State of S. Paulo where labour is properly organized, or where the proprietor is not tormented with the perpetual nightmare of finding himself suddenly without any labourers whatever. Mr. Pinto goes on to justify the employment of the surplus of State Revenue which, it should be remembered, is drawn exclusively from coffee, in importing labour to take the place of those who, after they have made money, annually leave the country. No doubt it is just enough, but would it not be wiser to try to fix the immigrant on the soil by making him a proprietor?

The crisis that the country is going through seems to us to be quite as much social as economical or financial, the effect of the metamorphosis commenced years ago, when slavery was first attacked, not yet complete. The attempt of planters to maintain semi-feudal conditions under a regime absolutely different to that under which they formerly grew and flourished and to make free labour conform to old practices is at the root of the old trouble. Freemen will only consent to be labourers when no other prospect is open to them, but they will not seek or remain by preference in any country that does not hold out prospects of independence.

The coffee problem will, we are convinced, be ultimately solved as the cotton problem was in the United States, by the sub-division of great estates and peasant proprietorship. When that occur little will be heard of low prices, because even now the margin of profit is ample to compensate labour, though it may not be enough to ensure returns on capital or to maintain the crowd of unnecessary intermediaries who live on the industry.

As regards production no doubt São Paulo is highly privileged. With a population of 2,000,000, exports in 1900 reached the value of £12,000,000 equivalent to £6 per head. The *average* rate of production in Argentina, however, is £9 5s. and in Uruguay £6 12s. per head, and in certain provinces such as B. Aires and Santa Fé more than double. In Australia the average value of exports *per capita* is £10 and in New Zealand nearly £13 all of which considerably in excess of S. Paulo.

If, therefore, comparative production were the only incentive to immigration all these countries would be preferred. But it is not, and other considerations such as guarantees for life and property, stability of values and proprietorship are equally powerful in determining the direction of immigration. As regards the first two, only Australia offers superior advantages to Brazil, against which are to be placed greater distance and, as regards Latin peoples, drawbacks of language, religion, and customs. In regard to proprietorship, however, Argentina offers far greater attraction than Brazil and is, on that account, likely to attract a far better class of immigrants, the class that comes chiefly at its own cost with the intention of settling in the country and becoming citizens and not mere hired hands.—*Brazilian Review.*

S. PAULO.

The *Brazilian Review* writes as follows:—

It is now getting on for three years since we commenced but never finished what our compositors used to call "tripa." Perhaps this time we will be more lucky and be able to get to our journey's end. Anyhow there is nothing like making a start, thanking God that one day comes after another, and that there must be an end to all things, even "tripa."

With years of discretion comes satiety, and after forty the joys of even a Rio Carnival begin to pall. Then we look in amazement on the time when water and lemons took the place of flowers and confetti and the joy of battle coursed fiercely in our veins.

Eleu fugaces, postume, postume, labuntur anni! Lost to me, lost to me!

The rising generation must be a wretched maudlin lot compared to their papas to take to such effeminate ways; or were we greater ruffians? Anyhow Carnival has lost its go here and everywhere, and is now but a reminiscence. About 7 p.m. on Sunday last the remorseless rain came down in buckets, confirming one's conviction that Rio at Carnival time is a place to get out of, and helped our halting resolution to be off and to explore the circumference of the world of which the Rua do Ouvidor is the centre and the hub, as is universally admitted.

Whatever may be the cause, whether the comet that failed to upset our axis and changed the climate, or the clerk of the weather is to blame, we have had altogether too much rain lately to be pleasant. . . .

When we made our last "tripa" the wide-gauge reached only Apparecida, now it has been extended much further and in the course of time will reach S. Paulo, unless balooning or some other kind of locomotion surprise it. It was, however, no great hardship to turn out of comfortless beds, stretch aching limbs, and refresh insides with the resources of Taubaté. The coffee is good as it

rly everywhere except on the S. Paulo Railway, and the chunks andwiches the same as ever. Man wants but little in Brazil wants that little long, so he gets a whole loaf cut in two for a dwich, and must have precious good teeth and a wide mouth lo it. And then the day broke dull and grey ovey the Serra do r and old Sol lighted up the prospect of desolation. Beside the t of the hills the line, like some great snake, wound its slow gth along the edge of the plain through which the Parahyba ds its tempestuous course. Here and there a solitary hut rked petty attempts at cultivation, where toiling thousands ld, in other lands, harrow the teeming soil and make it fruit-

Some day this valley will be the granary of Rio and corn rise shall wave from end to end; but these things shall not be nor of the indolent nigger. Within, conversation was of coffee, king, how depressed and humbled was his majesty and necessity of putting this Humpty Dumpty up on his throne in. The method most favoured seems to be kicking out Murho and unlimited issues of paper money. *Demooratisar o' dinro*, a politician called it, swearing in the same breath that y Barboza was the ruin, the *aza negra*, he called it, of the ntry. The way to *demooratisar o' dinheiro* it appears, is to d it to planters, the backbone and mainstay of the country! t all the king's money and all the king's men will never set that mpty up again. Over-production is of course nonsense, it can- be, because however much you produce consumers will always found at a price, but so long as production exceeds instaneous demand, complete consumption can only be attained by uction of prices.

From coffee the conversation drifted to the infinite, the problems origin and finality, unknowable, absorbing! And so before we ew it the boys were offering S. Paulo papers and the train had ched the outskirts of the city and it was time to look out for gands and your luggage.

COFFEE'S FOES IN B. C. AFRICA.

Writing to the *Ceylon Observer*, an old Ceylon planter says that spotted bug is very like a lady-bird and unlike all the Ceylon fee bugs flies about from tree to tree sucking at the juice of the ver, fruit, and tender shoots or buds as they appear on the coffee es. The damage done to the flower is terrible, completely desying the fructifying power even in the most favourable weather. regard to the fruit the insect sucks the juice, and seems to inject son into the berry when young which turns it black or spotted streaky, so that the fruit withers up and drops off the trees, even en it reaches the size of peas, just the same as the leaf disease ected the Ceylon crops leaving only small clusters or single ries to come forward to maturity and those berries that do reach t stage are mostly damaged.

The buds or terminal branches when sucked at, turn a dark green our and are stunted or bastard having a shrivelled-up appearance h a black pith and black spots showing between the bark and wood.

The damage alluded to is worst during the dry season when their very little sap in our coffee trees, and does not show much during growing or rainy season. I lost a fine crop about 6 cwts. per e this year with this bug. They came before the bush fires in arms and found a safe harbour amongst my coffee. In addition the new arrivals, those that had come in, and bred amongst the fee for some two years unheeded (I was not aware they did any mage) added to the damage done. To show you what a number bags I have gathered, I have had an average of 20 children at rk collecting daily for the past 6 months and they have each ought in from 30 to 60 per diem. Thank goodness, they can only a few, 3 to 5 each, now. So that I may get a bumper crop next ar. It was always next year in Ceylon, I remember during the f disease days. It is now quite certain in B. C. A. that we can- rear bug, and get coffee to yield crop. It is very fortunate wever that we have a remedy, although a tedious one, in catching spotted bug I was always looth to believe that our spotted bug l damage to coffee before I proved it by experiments.

have further proof this year by the fact that my crop is saved the pieces of coffee where there is a colony of soldier ants ablished; this tiger ant eternally racing about on the coffee eps the bug lively, not allowing them to rest and do damage, en if they don't succeed in catching them which they sometimes do, and of course the ants pull the little wretch to pieces and devour it at once. I am going to set a boy on with a piece of meat on the end of a stick to trap a party of ants and distribute them about the plantation to help to fight the bug and other insect pests. I remember, I think, doing the same with red ants in Ceylon, to try and get rid of helopeltis or some other pests on my cacao in Matale.

Our red ant seems to be identical with the Ceylon one, that used to torment the coolies so when handling, where they established themselves and made nests amongst the coffee leaves. Only they don't seem to bite so hard, or it may be the African negro has a thicker hide.

I am growing tobacco for which I can get 1s 3d per lb. for clean in South Africa. Tea I may turn to good account by-and-bye also in South Africa. Chillies pay very well here, I have been getting up to 55s 6d lately for them.

A YEAR OF TEA.

Messrs. Geo. White & Co. remark in their annual India, Ceylon and Java Tea Report, dated 22nd March, 1901.

The year which has elpsed since the issue of our last Annual has not been propitious for the majority of those interested in the production of British grown tea, chiefly on account of the output from all quarters having outstripped consumption. No doubt the high rates ruling for common grades in the Spring of 1899, gave an impetus to coarse plucking which has continued more or less ever since, and this coupled with the addition from extensions made in recent years gradually coming into bearing, together with weather conducive to heavy flushes both in India and Ceylon contributed to swell receipts, and temporarily glutted the markets of the world. Under these circumstances the 2d. per lb. extra Duty imposed on the 5th March, 1900, unfortunately pressed more heavily on the trade than it might have done otherwise, and in the opinion of many tended to depress prices especially for inferior sorts.

India.—The entire 1900 crop as given by the Indian Tea Association of Calcutta in their circular of 20th ultimo, was 187½ million lbs., of which 161¾ million lbs. have been shipped to this country against 149¼ million lbs. actually sent in the previous season, when the total yield was 170¼ million lbs.

Quality on the whole has been below the usual standard, partly owing to the reasons given above, with a proportionate decrease in fine and finest, and the averages as set forth on page 4 are for each district less favourable than in the two foregoing years. Arrivals from Darjeeling in August and September included some choice invoices, though later ones were, as a rule, not so good until the turn of the year, when a few consignments with cold-weather flavour came to hand and were taken up freely. Assams for the most part kept their position, and although some Managers appear to have gone in for quantity others were able to despatch shipments little, if any, below those hitherto manufactured. Dooars were generally disappointing, as they often lacked the full rich liquors for which they were formerly noted. Cachars and Sylhets proved in some instances of useful style, yet in others so common that buyers found it difficult to dispose of them even at the low level established. Kangras and Kumaons were in comparatively short supply and of mediocre character, but the few with distinctive flavour sold well. An increased amount was received from Travancore, the bulk of which was not up to the mark, the small portion where exception to this was noticeable, together with a few from the Neilgherries and Wynaad with delicate infusions were however in request.

One of the chief features has been the gradual decline in the quotations for common descriptions both Leafy and Broken. Pekoe Souchongs, which at this time, in 1899 were worth 8d. per lb., and at the same date in 1900 were selling at 6d. per lb., are now bringing scarcely 4d. per lb. The prolific growth which on many concerns could with difficulty be coped with also led to the leaf opening more than is deemed expedient, so that what should in ordinary cases have been Medium and Fine grades were really of a lower type, and consequently adversely affected results where this occurred. A brisk demand however existed throughout for the upper lines with sterling cup from gardens where quality had been maintained.

Statistics regarding deliveries during the period under review do not afford an accurate index as to actual consumption on account of the Duty scares which took place both this and last year, but so far as can be gathered, after allowing for heavier exports from here, it seems evident that a considerable part of the excess available has been used by the population of the United Kingdom.

From 1st July, 1900, to the close of February, the average for 1,085,000 packages sold in London at public auction was 7½d. per lb., contrasted with 8½d. per lb. for 1,057,000 packages and 8¾d. per lb. for 948,000 packages in the corresponding intervals of 1899-1900, and 1898-1899.

Ceylon.—The causes which led to augmented manufacture in other quarters seem to have prevailed, if anything to a greater extent in this Island and a lower type than usual has been produced from some districts, at times barely recouping shipping and other charges on realisation, besides endangering the prestige of these growths. Careful handling of the Green Leaf has in the main proved that with judicious working and the avoidance of extremes, the industry can still be rendered profitable, many places having made desirable quality for which there always is a ready sale. As will be seen from the table given on page 4 from the group classified as No. 1. 242,900 packages brought 9d. per lb., whereas none of the low-lying ones stood at less than 6d. per lb. for the whole year, though of course the depression during the past three months is not recorded there.

The total forwarded to this country from Colombo in 1900 was 114¼ million lbs. against 103½ million lbs. in 1899, while shipments from there to all ports were 148½ million lbs. *versus* 129¾ million lbs. respectively.

For the twelve months the following on Estate Account passed the hammer in London:—

1900.	1899.	1898.
1,125,100 packages.	1,138,100 packages.	1,108,800 packages.
(Average, 7⅞d. per lb.)	(Average, 8d. per lb.)	(Average, 7⅞d. per lb.)

Java.—Business has been on a somewhat extended scale, 42,600 packages of Java having been catalogued bringing 6⅛d. per lb. in contradistinction to 7d. per lb. for 38,300 packages and also for 30,200 packages in the two seasons before. These teas have kept steadily in favour with the Home Trade owing to their similarity to those from India, while the quantity sent to outside markets was also larger.

Prospects.—Although the present season closes without any near prospect of relief so far at least as the value of common and inferior grades of all kinds are concerned, the position can hardly be considered as devoid of brightness in the future, as in the nature of things it will work out a cure for itself though in doing so individual interests may suffer. Production has overtaken immediate requirements, but the trade is a sound one and if given a respite from the burden it has lately had to bear in the way of excessive supplies it should right itself ere long, partly through the expansion of business fostered by low prices. It is to be hoped also that the action to restrict output taken by the Committee appointed by the Indian and Ceylon Tea Associations may bring home to Directors of Companies, Owners, and Managers of Estates generally, the absolute need of serious attention to this matter, and although it may be difficult to formulate any scheme which can be universally adopted, that all will strive towards the desired end. In many cases it may be feasible to gather the leaf more quickly, *i.e.*, without letting it run so long. In others finer plucking may be resorted to, or portions of properties which do not give an adequate or satisfactory yield may be allowed to lie fallow. Planters in India especially may elect to finish their season rather earlier and thus curtail the crop, while on some gardens in Ceylon more rest may be given to bushes where stimulating manure has been used. In different ways therefore the same object may be kept in view, the result being that the industry will assume a healthier condition and that the cloud which now hangs over it will gradually disperse, leaving behind a lesson which should not however be forgotten for many years to come.

While there is much to be done by producers, distributors are not backward in taking their part and progress is being made in this respect, though slowly in some quarters. The Continent of Europe, and especially Russia, is consuming more British-grown tea every year, consequent on the persistent efforts of exporters both in this country and at the ports of origin. In Canada and the United States of America many are engaged in pushing the trade, and so in spite of a number of drawbacks the produc India and Ceylon is gradually being more used in other count than our own. If the manufacture of Green teas suitable for requirements of our Trans-Atlantic cousins should prove a succ as is confidently hoped by those who have taken it up so earne a further important step will have been gained and one which afford great relief to all concerned.

Another matter which should engage notice is that of encourag retail sales locally and it does not seem beyond the bounds of sibility that herein may be found an outlet for coarse leaf wh might be sold at such a figure as to induce the natives to be la consumers and yet be remunerative to growers. In this connec it may be noticed that a considerable business is at present tr acted by South Indian Estates chiefly from the Nilgiris, whence people all along the West Coast up to Bombay are principally suppl A certain amount from Ceylon too also finds its way there. Th done entirely through native shopkeepers and there is no do that the existing demand in the bazaars might be much increa by the offer of cheap tea in small packets. It is estimated already 4¼ million lbs. are disposed of in India alone.

Manufacture.—With reference to the treatment of the leaf, w we wrote last year seems still applicable, *viz*:—"Taking into sideration the larger area coming into bearing in some district would seem policy to avoid very coarse plucking and the manu ture of undesirable sorts which foster a low quotation here and t to glut the market. Where briskness, pungency, or full-bod liquor are attainable, every effort should be put forth to secure th characteristics. Plain featureless teas are more or less neglec especially in the very busy months, and good appearance with sterling cup no longer satisfies even the Continental buyers used to take that style of China Congou."

There have been occasional intances this season of breaks tain apparently by eucalyptus leaves (where these trees are cultiva having been allowed to find their way into the picker's basket, becoming mixed up with the tea during manufacture, which quently leads to less competition among buyers, and should guarded against.

The number of "cheesy" lots has again considerably decrea due possibly to more thorough final firing, and also to the exten use of patent packages (especially of those lined with thick le of which such a large portion now arrive. Partly due to w wood, but more often to carelessness in loading on board steamers, ullaged packages have given much trouble recently, volving loss in weight and necessitating an allowance to buy Some economy has been effected by slight reductions in Wareho charges, and also by the adoption of an improved system of wei ing by the Customs.

Size of Breaks.—The limits for large breaks remain as und *viz.*:—

India—20 Chests, 30 Half-chests, 50 Boxes. Ceylon—18 Che 24 Half-Chests, 40 Boxes.

Smaller lots than the above are sold after the regular aucti and though sometimes receiving attention are apt to be neglec particularly when sales are heavy. The proportion of these f Ceylon of late has been excessive, and it would be advantageou this could be altered. It is not well however to allow tea to a mulate at the factory, as if kept for any length of time it is li to lose its flavour, and to guard against this fewer grades migh sent. Indeed, under present conditions when so small a differe often exists between the value of ordinary Orange Pekoes, Pek and Pekoe Souchongs, it becomes a question as to the advisabi of shipping them home in one line. This might at all event tried on small estates where the crop is limited. The follow continues to be a saleable assortment; say:—A Broken Peko 30 to 50 chests; a good Pekoe of 50 to 80 chests; a Pekoe Souch of 70 to 100 chests, with an occasional break of Broken Tea Pekoe Fannings. Parcels containing dust are not readily mar able and this therefore should be sifted out and packed by its for which purpose some of the patent packages now in vo might be utilized so as to avoid leakage on the voyage res ing in loss of weight which often occurs with country-made che The exception to the foregoing is when a tippy Broken Ora Pekoe or Orange Pekoe can be made, as these when really generally command high figures, whether from India or Cey Should the quantity of leaf available for this not suffice for a f sized break of 20 Chests it might be packed in 30 Half-Chests.

MONTHLY SUMMARY.

INDIA TEA.—*Season*, 1900–1901.

When our last Annual was issued, *viz.*:—23rd March, 1900, there was on the whole a brisk demand, notwithstanding heavy clearances made in anticipation of the Budget. Useful Pekoe Souchongs were bringing 6d. per lb. compared with 8d. per lb. in the previous year. Nearly all kinds continued firm throughout April and May but without material change.

The first of the New Crop was printed on the 11th June, after Whitsuntide, when 626 packages, principally from Darjeeling and the Dooars, were disposed of with lively competition. Afterwards more was coming to hand, and stand-out lots showed a hardening tendency, but those lacking point and strength were neglected and easier.

At the opening of July Old Season's were rather less wanted, but desirable invoices of the New Teas were in request, and rates generally advanced. After the middle of the month buying became more important, and late arrivals proving attractive the market moved upwards.

After the Bank Holiday, business was resumed on the 13th August with larger sales. Cachars, Sylhets, and Dooars were in many instances poor, and for them comparatively low quotations were registered, but for the best shipments from Darjeeling and Assam full rates were paid, though the latter evinced a falling off in quality towards the end of the month.

During September there was not so much disposition manifested to purchase common and inferior liquoring consignments, which were coming more plentifully, and prices for these gave way ¼d. to ½d. per lb., low Pekoe Souchongs touching 4¾d. per lb., while many lots were withdrawn. On the other hand superior lines, and breaks with good cup maintained their position and went in favour of Importers, Broken Pekoes particularly being in request.

In October full supplies were brought forward (256,900 packages against 230,300 packages in the year before). These consisted to a great extent of ordinary descriptions and Trade being rather dull the sales passed flatly at a decline of ¼d. per lb. on Pekoe Souchongs and Broken Teas, while Pekoes and Broken Pekoes were as a rule ¼d. per lb. cheaper. A few of the Dooars indicated improvement while Cachars and Sylhets were on the whole of saleable style. Exports from the United Kingdom to outside quarters were 300,000 lbs. above those of the preceding year.

November opened weak with decreasing prices for common sorts and those with thin infusions, of which there was a preponderance in the catalogues. Attractive and tippy parcels however, invited attention and went firmly. Continental buyers were taking a fair quantity of Pekoes and Orange Pekoes.

A cheerful feeling was observable at the beginning of December with more enquiry, resulting from the idea that the lowest point had been touched though quotations under 6d. per lb. were often ¼d. per lb. down. A few choice Darjeelings came to hand but receipts from Assam and several other districts were not up to former ones. The better grades were in the main well supported, bidding being strong for fine and finest.

Auctions were recommenced after the Christmas and New Year Holidays on the 2nd January, when useful descriptions were in fair request on the basis of the closing sale of the year, but common tended to decline. Quality was ordinary in character with fewer Autumn-flavoured teas than usual. Inferior sorts remained depressed during the month, but for others some enhancement was noticeable. Heavy payments to forestall a possible rise in the Duty occupied the attention of the trade, and prejudicially affected the market.

In the first fortnight of February a dull tone prevailed, the large daily deliveries absorbing both the time and capital of dealers. The lower kinds went ¼d. to ½d. per lb. adversely to importers, Pekoe Souchongs selling down to 3½d. per lb. and Pekoes 4d. per lb., and there was much irregularity in the offers for others. After the middle of the month, however, partly due to smaller auctions and a slackening in the clearances, buying was more universal, with increased spirit in the Room. Common did not alter but medium and fine received more notice with a recovery in values. Choice Darjeelings realised high figures, and all lots with cold-weather flavour sold well.

March.—Relief being afforded by less tea being taken out of Bond day by day, desirable kinds suitable for Home and Export purposes ruled firmer, while finest, the supply of which was becoming exhausted, met a well-sustained enquiry. All descriptions under 5d. per lb. continued dull of sale.

Ceylon Tea from 24th March, 1900, to 22nd March, 1901.

March last year ended with a steadier tone in the bidding than was apparent at the commencement, when sales were stopped for one week on account of the Budget scare. Pekoe Souchongs and Pekoes of ordinary character were worth 5¾d. and 6d. per lb. respectively, or 1½d. to 2d. per lb. under the quotations of a year ago.

The market did not show much change in April until the first sale after Easter, which was held on the 24th, when there was a firmer tendency for leafy kinds under 6¾d. per lb., though Broken Pekoes went irregularly. Arrivals lacked strength with only a small proportion of finest.

In May with increased receipts of undesirable quality to be handled and quieter trade in the country there was less enquiry. Common Pekoe Souchongs did not alter in value, but fair to medium Pekoes and Orange Pekoes were weaker and Broken Pekoes under 8d. per lb. fell ½d. per lb. Attractive parcels however brought full rates. For the month a fall of ⅜d. per lb. took place in the general average, the lowest weekly result yet recorded being 6¾d. per lb. on the 29th.

Owing to Whitsuntide the opening auction of June did not take place until the 12th. There was an easier feeling for thin liquoring sorts of which the catalogues contained a large assortment and the 92,900 packages put forward in the month only realised 6⅝d. per lb., but good medium and fine with full flavour were well supported. In view of the over-production of British-grown tea the question of making "Green Teas" both in India and Ceylon for shipment to America and Canada was placed prominently before Garden owners.

Throughout July Home and Export buyers were purchasing freely. Low Pekoe Souchongs and Pekoes hardened and the latter as well as Orange Pekoes with good flavour rose ½d. to 1d. per lb. Broken Pekoes with poor cup under 9d. per lb. were cheaper towards the close, but fine and finest with quality were well competed for throughout and as a rule secured enhanced quotations.

(*Sales.*)

For the first sale after the Bank Holiday on 14th August, the largest quantitiy at present advertised for one day, *viz.*, 44,700 packages, was declared which went off unevenly and mostly against sellers, unless for the best invoices which held their own.

Notwithstanding smaller auctions demand throughout September was quiet, except for stand-out lines, which were firmer. Common Pekoe Souchongs declined to 4¾d. per lb., and all grades under 7d. per lb met less enquiry. For Broken Pekoes from 8d. per lb. up however, there was more competition, the desirable lines fetching higher prices. Quality which had been for some time below par manifested improvement.

Landings in October possessed more flavour which induced brisk buying in the case of those parcels where this was observable, but all grades with poor and pointless infusions received diminished attention. Medium Broken Pekoes of useful character were well taken up and Choice Orange Pekoes and Broken Orange Pekoes made full figures.

Although a moderate amount was brought to public sale in November, inferior liquoring lines of all descriptions remained easy, principally owing to heavy arrivals of a similar class from India, though the low range current seemed to be favorably affecting deliveries. Medium and fine were in better request and taken at a rise towards the close of ½d. and 1d. per lb. in many instances. In a memorandum issued by the Board of Trade the annual consumption of tea in the United Kingdom was estimated at nearly 6 lbs. per head of the population, this being approximately composed of 3 lbs. Indian, 2 lbs. Ceylon, and 1 lb. China, Japan, etc. The most taken by any European country was 1·39 lbs. per head in Holland.

In December, medium and fine were wanted both for the home and Export Trades, but all sorts under 6d. per lb. were neglected, and the market closed prior to the Holidays with a flat tone, Pekoe Souchongs selling down to 4¼d. per lb., or 2d. per lb. under what they stood at 12 months before.

Business re-opened after the turn of the year on the 3rd January, when stocks having accumulated full supplies were available, reaching 146,000 packages for the month. Quality was indifferent, and dealers being occupied with clearances in anticipation of the Budget, prices were depressed, particularly towards the end, for all except the most attractive consignments. The Continental demand also was quiet owing to the Holidays, especially in Russia. A Committee was chosen to examine into the question of cur-

tailment of output and to advise as to the means which should be taken to bring this about.

During the first half of February duty payments were engrossing the time and capital of most buyers, so that the auctions passed without much spirit and at a decline of ¼d. to ½d. per lb. for common to fair leafy kinds while others were irregular and easy. The bidding was stronger later on however, and although no rise in the lower descriptions was registered all breaks with fine flavour were generally dearer. Many of the teas showed signs of finer pluck-ing.

March.—Inferior sorts remained depressed but there was more enquiry for Pekoe Souchongs with flavour both for this and Foreign Markets. Broken Pekoes above 6d. per lb. were also in better request. Several invoices with superior quality to that of previous arrivals of the same marks were now coming to hand.

GLAZED COFFEE IN OHIO.

The Dairy and Food Commissioner of Ohio, Hon. J. E. Blackburn, on February 19, notified Arbuckle Brothers that "'Ariosa' coffee, as now prepared, is, in his opinion, an adulteration under the laws of Ohio." This opinion of Mr. Blackburn is based on that provision of the food laws of Ohio defining adulteration, which says:

"Sixth.—If it is colored, coated, polished, or powdered, whereby damage or inferiority is concealed, or if, by any means, it is made to appear better or of greater value than it really is."

The Commissioner also holds "that it is not a compliance with the foregoing to simply label the article 'Compound,' when coffees are filled, coated, and glazed to make them appear better or of greater value than they really are, and to retain water that has been added to increase weight."

Technically, under the laws of Ohio, Commissioner Blackburn may be correct; but it is strange, at least, that he has discovered that "Ariosa" coffee is adulterated under the laws of Ohio, seventeen years after they became effective, and fifteen years after the creation of the office of Dairy and Food Commissioner.

The opinion of Commissioner Blackburn, respecting "Ariosa" coffee, while perhaps technically defensible, is against the spirit and object of food laws, primarily enacted to protect the people against the sale of unwholesome and fraudulent foods. To class "Ariosa" coffee as such seems an extreme and, to us, indefensible action.

The coating, or glazing, on "Ariosa" coffee, is a preparation of egg, which tends to retain the aroma of the coffee, and to act as a clarifier in its brewing. It is not put on to conceal damage or inferior quality, and its low price, as compared with the coffee generally sold in Ohio, quality considered, is proof that the glazing is not to make it appear of greater value than it really is.

"Ariosa" coffee has been sold without restraint all over the United States for a quarter of a century or more. Its present cost is phenomenally low, by reason of the savings effected through the purchase of cargoes at a time, and the adaptation of machinery to all the processes involved in its preparation for market, even to putting it into packages.

After a food law has been operative since 1885, without consumers complaining that they had been injured in health or defrauded in pocket, it seems strange, at least, that Commissioner Blackburn should, at this late day, suddenly discover that "Ariosa" coffee is adulterated.

We recognize that the Supreme Court of Ohio has held that the duties of the Dairy and Food Commissioner are mandatory. If so, then the present and former Dairy and Food Commissioners of Ohio have been very neglectful of the interests of the people for the past sixteen years.

Such an extreme interpretation of a food law as that in the case of "Ariosa" coffee tends to bring all food laws into disrepute. Unfortunately, the Ohio law, which is largely copied from the New York State law, omits a very important proviso, which makes elastic a law which otherwise would be onerous and unjust, and work irreparable injury because of its ironclad provisions. A study of the definition of what constitutes adulteration under the Ohio law, as in all other State laws, will show that it covers every imaginable form of food adulteration, sophistication, or contamination, even covering harmless forms of food manipulation perfectly defensible on all grounds, but scientifically classed as an adulteration.

To avoid injustice or unfair attacks on wholesome food product technically adulterated for good and sufficient reasons, the Ne York law provides as follows:

"Seventh.—*Provided*, that the State Board of Health may, wi the approval of the Governor, from time to time declare certa articles or preparations to be exempt from the provisions of th act; and

"*Provided further*, that the provisions of this act shall not appl to mixtures or compounds recognized as ordinary articles of foo provided that the same are not injurious to health, and that th articles are distinctly labeled as a mixture, stating the componen of the mixture."

The New Jersey law has a similar provision, but the Ohio law an the laws of other States omit part or whole of this very wise an necessary provision.

If the Ohio law is defective, the action of Commissioner Blac burn, in enforcing it, is a step in the direction of its amendmen and therefore defensible. We cannot escape the conviction, hov ever, that he has stretched a point in waging a war against suc a wholesome and meritorious article as "Ariosa" coffee. We a aware that the Ohio law requires that mixtures or compounds so within the State must bear on the label the name and per cent. each ingredient therein. This compels manufacturers to mak their formulas public property, and thus rob them of all benefit their invention or special method of production. Glazed coffee ca scarcely be called a mixture or a compound, but could properly l classed as a food accessory.

If the action of Commissioner Blackburn eventually leads modifications in existing State laws, and their being made uniforn it will turn out a blessing; but, if it tends to make food laws vehicle of oppression, and a means of interfering with legitima trade and commerce, then it would be better if they were replaced.—*American Grocer.*

DISTRICT ASSOCIATIONS.

INDIAN TEA ASSOCIATION (CALCUTTA).

Extract from an Abstract of Proceedings of a Meeting of th General Committee held on 26th March, 1901. Present:—Mr. H. S. Ashton (*Chairman*), Mr. A. Tocher (*Vice-Chai man*), and Messrs. H. C. Begg, H. W. Boyd, W. Brow W. Holder, R. Magor, and R. R. Toynbee.

Letters, dated 1st and 8th March, from the Secretary, Indian Te Association, London, were brought up for final consideration an disposal after previous circulation. The chief matters dealt wit in these letters were:—

(*a*) **Bounty on Green Teas.**—With his letter, dated 8th Marc Mr. Tye forwarded copies of the following resolution respectin this matter, which had been adopted by the London Co mittee, *viz.*:—

"That 1½ annas per lb., up to a maximum of 200,000 lbs. to manufactured this season, be allowed out of the funds of th levy shipments of green tea for the American market se there direct from India, such funds to be distributed as bounty at the discretion of the Calcutta Committee, th definition of the term 'green tea' for the receipt of the bount being taken to be tea made from the ordinary leaf plucke on the gardens, such as would be ordinarily made into blac tea, but which in its altered manufactured state will n compete with the sale of black tea in America or elsewher The bounty to be paid on the same quantity as befo sanctioned, *viz.*, 200,000 lbs. until it is seen what success attained in the manufacture of green tea. The Associatio in Calcutta to be requested to notify the Committee prompt if a larger quantity than 200,000 lbs. is likely to be specia prepared for shipment to America."

The General Committee, after discussion, decided to refer th resolution to the Sub-Committee (the Vice-Chairman and Mr. H. C. Begg) appointed at the last meeting. They were to be asked re-model the instructions contained in the circular issued to mem bers of the Association on the 7th August, 1900, in such manner to bring them into accord with the terms of the resolution.

But, in accordance with the decision come to at the last meetin

o definite action in the way of offering the bounty was to be taken, ending the result of the movement for restricting production.

(*b*) **Restriction of production.**—The Committee noted from Mr. Tye's letters that the scheme for reducing production, which was set forth in the circular of 14th February, was being supported in London. From a telegram, dated 19th March they had also learned that the period for receiving replies had been extended to the 31st March. The undertakings signed in India to date represented a reduction of slightly more than $3\frac{1}{2}$ million lbs.

A letter, dated 19th March, from Mr. H. H. Mann, B.Sc. F.I.C., ealing with certain scientific aspects of the proposal to restrict oduction was to be printed and circulated to all the members of ie Association.

Considered a preliminary draft report of the Sub-Committee apointed at the last meeting to consider the question of the sale of a in India. Briefly stated, the proposals of the Sub-Committee ere for the establishment of a tea distributing Agency. To start ie Agency they suggested that tea producers should be asked to ontribute a certain quantity of tea yearly Tea so contributed ould be sent to Calcutta, whence it would be distributed through ndia by the Agency. The work of the Agency would be under the irection and control of a Superintendent or General Manager. ravellers would be employed to push the trade, which would be irried on mainly by Native dealers in the Bazars. Further, the ub-Committee suggested that brewed tea should be sold at ailway stations. They also thought that an attempt might be ade to have tea sold at the so-called extra departmental post fices throughout the country. It would not be necessary to otain the sanction of Government to the sale at Post Offices of at class. The operations of the Agency might also, they consiered, extend to the countries beyond the North-West frontier, g., Baluchistan, Turkestan, and Persia.

The General Committee approved of the Report, subject to certain mendments of minor importance. In accordance with the decision me to at the last meeting, they had recommended the London ommittee, by telegraph, to allot Rs.50,000 from the American nd Foreign Market Fund to the work of developing the Indian arket. A reply had been received to the effect that the London ommittee desired to see the scheme which it was proposed to ut into operation before deciding to make the allotment. In sponse to this the General Committee had sent copies of the Sub-ommittee's Report to London by the mail of 21st March. In ew, however, of the urgency of the matter, and also of the fact at the London Committee were understood to be strongly in vour of the idea in a general way, they decided to telegraph gain asking that they should have discretionary power in regard the allotment.

In the meantime the report was to be referred back to the Sub-Committee forrevision, and for proposals as to the action to be taken.

Considered a letter, dated 19th March, from Mr. J. M. Korb of alimpong, regarding the introduction of Indian tea into Tibet. In ecember last, the Committee had arranged for the manufacture, a Darjeeling Garden, of a small quantity of brick tea, which was be given to the Tibetan wool traders who visit Kalimpong. The aders were to be asked to take the tea openly, as Indian tea, rough the trade mart at Yatung. The object was to ascertain ecisely the attitude the Chinese Customs authorities would take towards Indian tea, and more especially the rate of duty they ould levy upon it.

Mr. Korb had kindly undertaken to distribute the tea to the aders. From his letter the Committee learned that the traders ere not very favourably inclined to the tea; and although they d accepted some small quantities of it, Mr. Korb could not induce en one of them to take whole boxes into Tibet in the way desired the Committee. They stated as the reason for their refusal that ey were afraid of punishment at the hands of the Llamas.

The Committee noted this information with some regret. And ey decided, before taking further action, to ask Mr. Korb to give em further particulars on the subject.

Considered a letter, dated 24th March, from Mr. H. H. Mann, in ich the Committee were asked if they would object to the publiion, by Dr. Geo. Watt, C.I.E., Reporter on Economic Products, the *Agricultural Ledger* of such of Mr. Mann's reports as might deemed suitable.

The Committee had no objection to the proposal, and they decided inform Mr. Mann accordingly.

They also agreed to write to Dr. Watt on the matter. And as they understood he would shortly be proceeding to Simla for some time, they desired to take the opportunity of expressing to him their cordial thanks for the many services he had rendered to the tea industry in his capacity as Reporter on Economic Products. They wished specially to refer to his valuable work on the pests and blights of the tea plant, and to the uniformly courteous manner in which he had always been ready to assist any one interested in the industry with scientific information and advice upon matters relating to the cultivation and manufacture of tea.

COORG.

Proceedings of a Quarterly General Meeting held at the Bamboo Club, on Saturday, 30th March, 1901. PRESENT :—Messrs. H. R. Craig, H. E. Cockerton, W. Davies, Geo. Davies. J. W. Finlayson, J. Logan, H. M. Mann, F. Macrae, H. G. Parsons, J. W. Scott, N. M. Scholefield (*visitor*), and A. Lambert (*Honorary Secretary*).

Proposed by Mr. Logan, seconded by Mr. Parsons that Mr. Craig do take the chair.

The Honorary Secretary went through minutes of last meeting and in connection therewith mentioned that the .Mysore Government whilst agreeable to meet our wishes in connection with Dr. Lehmann's visit to Coorg, were unable to spare his services until after the S.-W. Monsoon, when we hoped to welcome him to Coorg.

Local Fund Board.—The Chairman spoke at some length on this subject carefully explaining his views, after which the chief sections of the notification concerning the new District Fund were fully discussed. It was finally resolved to apply for an increase of Planter members on the said Board, considering the large interests represented by the planting industry in the Province. It was proposed, also, by Mr. Craig, seconded by Mr. H. M. Mann, that ballotting papers be issued for the election of the S. Coorg member. Carried unanimously.

Advertisement of Coffee.—Mr. Parsons, who brought forward this subject, expressed his views thereon in clear and concise language and moved the following resolution, seconded by Mr. Lambert.

That, in the opinion of this Association, a cess amounting to two annas per cwt. should be imposed on all coffee exported from India for the sole purpose of advertising and pushing the sale of pure East Indian Coffee in Great Britain, the Continent, and wherever, hereafter, may be deemed advisable.

That the Government of India be asked to collect the cess at port of export, all proceeds to be paid into a fund to be exclusively administered by a Select Committee of the U. P. A. S. I.

(Signed) H. G. PARSONS.
(,,) A. LAMBERT.

There was some discussion thereon, during which the Chairman spoke strongly in favour of the scheme; and the advisability of asking Government to collect the cess was questioned. But on the resolution being put to the vote it was carried with hardly a dissentient voice.

Read Mr. Sprott's letter on the above subject. Recorded with satisfaction.

French Import Tariff on tea, coffee, pepper, and other Colonial products. The Honorary Secretary read correspondence thereon and pointed out that according to the latest information on the subject received from the French Ambassador, through the Foreign Office, the French Government had owing to the large interests of the English commerce in connection with these Colonial products, granted her two years' grace, but that she was willing to concede to her the advantage of a minor tariff definitely, if the English Government was disposed to offer, in return, equivalent advantages for a certain French product to be agreed upon. The Honorary Secretary also stated that the Government of India had been addressed on the subject by the Chairman of the U. P. A. S. I. in a strong and able letter supporting the request of the Malabar Chamber of Commerce that the Government of India take early steps to enquire fully into the abovenamed question.

Prevention of Coffee-stealing.—Read letter from H. E. Sullivan, Esq., Superintendent of Police, S. Canara. Resolved that Mr. Sullivan be thanked for the trouble and zealous care he has displayed concerning this matter, and that the various curing firms be asked for their opinion and advice on the various points touched upon, with a view to taking further action on the suggestions contained therein.

General.—Read Mr. A. J. Wright's letter *re* the Salem incident—recorded with satisfaction. Mr. Parsons brought to the notice of the meeting the perfunctory manner in which metal is being stacked along the Ammutti-Sittimutti Road, making it very inconvenient, if not absolutely dangerous, in parts, for wheel traffic. Resolved to address the Executive Engineer on the subject.

A vote of thanks to the chair terminated the proceedings.

The following papers were laid on the table :—

Proceedings of Central Travancore Planters' Association.

Polli Betta, *6th April, 1901.* } (Signed) A. Lambert, *Honorary Secretary, C. P. A.*

A STORY OF THE CENTURY.

Here is a quotation from an old friend of mine and of yours—a doctor, one of the wisest, most kindly-hearted, and successful of the men who compose his useful profession.

"One thing," he says, "I have been telling my patients for the past forty years, that, so far at least as the science of medicine is concerned, the human mind is merely a name for a group of brain functions. The food in the blood acts chemically upon certain nerve centres, and this is mysteriously worked up into what we call reason. In other words, the condition of the mind depends upon that of the body.

"For example," continues the doctor, "there are people who are troubled by irritability, great mental depression, sleeplessness, mental hallucination, and those symptoms expressed by the general term '*nervousness*' (and who also fear insanity), who might either avoid such sufferings or be cured in a month, if they but knew that at the bottom of the whole business lie the poisonous products of imperfect digestion. *Ninety per cent. of all the cases of mental and nervous ailments in persons under fifty are directly due to dyspepsia.*"

Now we will listen to Mr. George Bath.

"For many years," he says, "my life was marred and spoilt by indigestion. At first only slight, the attacks became more and more severe as the years rolled by, until at last I was a mere physical wreck, a ready prey for every disease. My head was racked with pain, fierce darting, stabbing, rending pains, that almost drove me frantic. I had no relish for food, and what morsel I did swallow filled my body with wind and caused a most oppressive sense of fulness on the chest.

"What with a distressing sense of sinking in the stomach, and a constant feeling of sickness, through the foul state of my tongue, I felt, as I looked, 'of all men most miserable.'

"This wretched existence—it wasn't life—I dragged on for *twenty years* with just a short respite now and then. Each year the disease tightened its grip, sapping my strength and vitality. Doctors examined me and gave me medicine. They lightened my purse but not my ills. At times I turned quite dizzy and faint, and got so nervous and depressed that I scarcely dared venture out of doors.

"My whole nervous system seemed unstrung; the slightest noise distressed me. Why, the ticking of a clock, in *another room*, was sufficient to keep me awake for hours, and a knock at the door would make me jump and tremble all over.

"Friends shook their heads as they saw me tottering about more dead than alive, and said 'Bath has not long to live, poor fellow.' That was six years ago, but I'm alive still and very much alive too. Why, I seem to be getting younger every day. Though I am now seventy years of age, I am so brimful of energy and animal spirits that I feel equal to anything. It was Seigel's Syrup that wrought the change, nothing else; I owe my life to its wonderful power.

"Now, forty clocks ticking wouldn't spoil my sleep, and food must be very indigestible indeed to upset me. I would rather lose £50 than be without Seigel's Syrup, for it has made a man of me, and added years of happiness to my life." George Bath, Trefusis Villa, Windmill Road, New Brompton, Kent. April 25th, 1900.

No word of the writer's can add one jot or tittle to Mr. Bath's frank and eloquent statement, the truth of which is vouched for by many independent witnesses, among them being Mr. John Scrace, Relieving Officer, Medway Union, Chatham, and Mr. A. Durrant, Short Street, Luton Road, Chatham, to both of whom Mr. Bath is personally known.

Now turn back to the quotation from the old doctor, and y will learn what Mr. Bath's disease was. No, never mind, I will it down here—it was dyspepsia. Oh, if my voice could but rea all the suffering men and women in dear old England, how I wou shout to them the old doctor's deep saying and the story of M Bath's illness and cure. But, as it is, we must take the chanc of their seeing this report in print.

MARKET REPORT.

[*Per Mail advices of 22nd March* 1901.]

COFFEE.

The London Commercial Record says :—Supplies advertised ha been far too heavy to admit of them being disposed of within t usual hours, and many catalogues have had to be postponed fr day to day. The demand has been very irregular. Good to f East India, as a rule, met with fair competition and full pri were paid, but at the close there was very little bidding even these, and the week finishes with a decidedly flat tone; other grad of East India are sold of sale at a decline of 1s to 2s per c Plantation Ceylon cheaper. Costa Rica and other Central Americ descriptions sold slowly at prices favoring buyers. The market "futures" has been variable, fluctuating with the daily receip and close with some irregularity; yesterday May delivery sold 31s 3d, September at 32s to 32s 3d, and December at 32s 7½d to 9d. To-day's auction supplies consisted of 981 bags East Ind 3,119 bags Costa Rica, 196 bags Mexican, 1,232 bags Guatema 582 bags Salvador, 59 bags New Granada, and 374 bags Guayaqu The sales went of with a dull tone and generally lower—1s per c down for common qualities, such as Guatemala at about 44s 45s per cwt.

arch 20...	5·60	5·60	5·65	5·75	5·75

TEA.

INDIAN.—Sales amounted to 43,800 packages compared with ,800 packages in the preceding week, and 42,000 packages at this riod of 1900.

A somewhat stronger tone prevailed, except in the case of low mmon kinds, which remained steady at previous rates. Above per lb. however, there was more competition for all useful and e liquoring sorts, higher prices being generally obtained, pecially for parcels with full cold-weather flavor.

For 34,400 packages on Estate Account $7\frac{1}{8}$d per lb. was realised ainst 8d per lb. for 33,500 packages and $9\frac{1}{2}$d per lb. for 25,000 ckages in the two foregoing seasons.

CEYLON.—Auctions totalled 24,700 packages *versus* 28,400 packa-s on the 12th instant and 27,600 packages twelve months since. After allowing for improved quality in many of the arrivals, no terial change occurred in quotations, though bidding was brisker most descriptions. Inferior Pekoe Souchongs and Pekoes were altered, but the latter and Orange Pekoes with desirable cup d in favor of importers. Broken Pekoes for the greater part led firm, and the best liquoring were in good request, while oice lines on the whole went well.

The average is a little under $6\frac{3}{4}$d per lb. On the 14th instant it s $6\frac{1}{2}$d per lb. and $7\frac{1}{2}$d per lb. in 1900.

JAVA.—Rather over 1,600 packages of direct import passed the mmer with spirit, a slight upward tendency being noticeable in ne instances.

Only 220 packages are advertised for next week at present.

Deliveries.—The clearances of all Tea (on which duty has been id) from the London warehouses, as per official returns are, .:—

From 1st to 19th March,	1901	... ...	10,891,018 lbs.
Do. do.	1900	... ...	28,294,765 ,,

During the week the following have been printed for sale by blic auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	39,045	4,754	43,799
Ceylon	22,991	1,664	24,655
Java	1,291	375	1,666
Total ...	63,327	6,793	70,120

Also 861 packages from second hands.

Messrs. Gow, Wilson & Stanton's Indian, Ceylon and Java Tea Report, dated March 22nd, 1901, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian. Pkgs.	Ceylon. Pkgs.	Java. Pkgs.
1900-1901	1,458,251	1,066,505	51,676
1899-1900	1,469,677	982,157	47,886

44,272 *pkgs.* INDIAN
25,257 ,, CEYLON
2,117 ,, JAVA
} Total 71,646 packages were offered in public auction this week.

The total crop of Indian Teas for the past season was nearly 13 million lbs. ahead of that of 1899, and nearly 35 millions greater than that of 1898; this does not include the Teas grown in Travancore.

INDIAN.—The market was steady for all descriptions, choice liquoring Teas meeting with very strong competition. 74 last of the season invoices have been sold, against 62 last year. The official wire from Calcutta gives exports to U.K. for first half of March as 983,000 lbs., against 200,000 lbs., same Period last year making the total from 1st April to date 161,813,000 lbs., against 48,692,000 lbs. last year. The following averages are worthy of note:—"Makum T Co.," $1/4\frac{1}{2}$; "Jokai T Co. Sabansiri P.," $1/2\frac{3}{4}$; "Koomtai" and "Suddia Road T Co.," 1/1; "Amal Tea Est. Lattakoojan," $1/0\frac{3}{4}$; "Balijan T Co., $1/0\frac{1}{4}$; "Assam Fron. T Co. Hilika" and "Darj. Con. T Co. Ting Ling." 1/0.

Week's average of Tea sold on Garden Account 1901, 34,628 pkgs., av. 6·82d. 1900, 34,293 pkgs., av. 7·97d.

Total Tea sold on Garden Account 1st June, 1900, to date, 1,210,201 pkgs., av. 7·23d. 1900, 1,151,838 pkgs., av. 8·32d.

CEYLON.—With a smaller sale, bidding was animated, and prices for medium and good Teas were, if anything, stronger common grades selling without change on last week's rates. Quality from several estates has much improved during the last few weeks, and many of the Teas now arriving have a nice attractive flavour. Private advices from Ceylon gives exports to U.K. for first half of the month as 4,500,000 lbs., against 5,200,000 lbs. same period last year, and estimate the quantity available for March at 8,750,000 lbs. against 10,500,000 lbs. in 1899. The following average may be mentioned:—"Nuwara Eliya T Co. Concordia" and "Sutton," 1/1; "Portmore T Co.," $11\frac{1}{2}$; "Loinorn," $11\frac{1}{4}$; "Devon" and "Mount Vernon," 11d.; "C T P & Co. West Holyrood," $10\frac{3}{4}$d.

Average for week 6·65d. against 7·58d. in 1900.

Ceylon Tea sold on Garden Account 1st Jan. to date, 308,185 pkgs., av. 6·48d. 1900, 280,219 pkgs., av. 7·58d.

JAVA.—2,117 packages were brought to auction, of which 1,650 pkgs. were of direct import. Competition was good, and comparatively little Tea was withdrawn, the market for all descriptions being steady at prices fully up to late rates. As is the case with Indian and Ceylon Tea, there has been an appreciable rise in Javas from the lowest point of the market.

Bank Rate 4 per cent. Exchange on London, three months' sight:—Calcutta $1/4\frac{3}{16}$. Colombo $1/4\frac{7}{32}$.

COCOA.

There was a large supply brought to the hammer on Tuesday, the total aggregating 11,928 bags. For fine grades of West India full to rather higher prices were obtained, but medium qualities were 6d to 1s lower, and other growths almost neglected. Of 1,561 bags Trinidad catalogued about 900 bags sold—good to fine red at 68s to 71s, being fully steady. Grenada was represented by 7,894 bags, which heavy quantity went off well, although opening slow, at a slight advance for the standout lots, about valuations for medium and fair, and 6d to 1s decline on the lower grades; fine realised 64s 6d to 66s, fair to good 63s to 64s, and common 60s 6d to 62s 6d. 180 bags Dominica about half sold at 60 to 63s, while 39 bags fermented Jamaica mostly sold at 64s 6d. 86 bags St. Lucia about one-fourth part sold at 62s to 63s, while 23 bags St. Vincent were quitted at 69s for superior red and 60s 6d to 65s 6d for common to fine. Of 713 bags Guayaquil catalogued only 70 bags sea damaged sold at 62s 6d. Ceylon absolutely neglected, and the 1,124 bags catalogued all passed the hammer unsold, as did 308 bags Samana Private transactions include 300 bags Trinidad at auctions' rates, 250 bags Ceylon at 82s 6d to 90s for good bold and medium, and 70s for ordinary; 200 bags Guayaquil, greyish Caraquez at 64s to 65s, good Arriba 80s, and a small lot of Puerto Cabello at 105s per cwt.

GINGER.

Cochin.—Is very firm but there is little trade being done. Catalogues embraced 125 cases 492 bags of which 20 bags sold prior to the auctions at 36s for good medium and small washed rough, the remainder all passing the hammer unsold at 45s to 48s for medium and small Native cut and at 38s per cwt. for ordinary Calicut rough.

African.—43s bags were bought in at 35s per cwt.

Jamaica.—Very firm. 78 barrels sold—middling bright washed 44s 6d to 45s, low middling 31s to 41s, small and dark 35s to 36s 6d. per cwt.

PEPPER.

Black.—The market has been quiet this week, and easier prices have been taken. About 100 tons Singapore have been sold for arrival—at $6\frac{3}{16}$d for March-May shipment, and at $6\frac{5}{16}$d for April-June. On the spot sales of fair Singapore have been made at 6d to $6\frac{1}{32}$d.

Only 8 bags Aleppy were brought to the hammer on Wednesday; they were brought in.

To-day. Black Pepper steady. Singapore April-June shipment $6\frac{3}{16}$d buyers. In White very little business done.

For arrival Tellicherry has been sold at 54s 6d to 55s per cwt. delivered weights Continental ports, per March-May and May-June (s).

The shipments of Black Pepper for the first half of March compare as follows:—

	1901.		1900.	
U. K.—Singapore ...	70	80	120	240
,, Penang	10		120	
Continent		170		190
U. S.		*nil*		330
Total tons ...		250		760

White.—Is also quiet and easier. Singapore has been sold the spot at $8\frac{7}{8}$d to 9d, and Penang at $8\frac{3}{8}$d. For arrival 50 t Singapore have changed hands at $8\frac{7}{8}$d for April-June, and at May July shipment (s).

At public sale on the 20th instant only 3 bags Ceylon w offered; they realised $9\frac{3}{4}$d for fine bold and $8\frac{1}{4}$d per lb. brownish.

The shipments of White Pepper for the first half of Ma compare as follows:—

	1901.		19	
U.K.—Singapore	*nil*	30	20	
,, Penang	30		130	
Continent		70		
Total tons		100		

CINCHONA.

The first shipments from Ceylon for 1901 commenced in week ending February 18, when 21,679 lbs. were exported: following week 52,190 lbs. were shipped, bringing the total 73,869 lbs., against 45,286 lbs. for the corresponding period of 19 To the auctions to be held at Amsterdam on March 28,852 ba (weighing 79,512 kilos.) have been added, bringing the total 6,614 bales and 218 cases (624,980 kilos.)

QUININE.

The comparatively heavy shipments of cinchona from Java the first half of March have had a depressing effect on the speculat market this week, and no business of consequence is report The spot price for good German brands of sulphate in seco hands has dropped to 1s 3d, but the small sales have chiefly b for August delivery at from 1s $3\frac{1}{2}$d to 1s $3\frac{7}{8}$d, with sellers to-d at the inside figure. Howards' advanced their quotation last we to 1s 8d for 1,000-oz. lots in vials. Amsterdam also advanced th quotation to 1s $4\frac{1}{2}$d.

SUBSCRIPTION.—Payable in Advance: Yearly, Fifteen Rupees; lf-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two pees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is As. 4 r line for the first; As. 3 for the second, and As. 2 for the third and cceeding insertions. Five-line (or shorter) advertisements from Subscribers ll be inserted for three issues for One Rupee; non-Subscribers will be arged Two Rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic currence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to E. C. DUFF & CO., Proprietors, lanting Opinion," 106, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 26th instant. Season reports should be sent direct to the Printers, Messrs. Higginbotham & Co.

Munzerabad. *April 16th.*—*Weather*—Hot days with East winds changing to West and cooler at nights. *Works*—Many estates have stopped work entirely now, others are finishing pruning and manuring. *Plant diseases*—This year is expected to be a heavy one for borer. *Health*—Good. *Labour*—Abundant. *Interesting item*—The appeal in the local Igoor murder case failed, and the accused are now free.

FOREST ENGINEERING FOR INDIA.

We have received for review Volume I. of "A Manual of Forest Engineering for India," by Charles Gilbert Rogers, Fellow of Cooper's Hill, Deputy Conservator of Forests. Imperial Forest Service of India, published at Calcutta, at the office of the Superintendent of Government Printing, India, at Rs.4 per copy. The preface informs us that the Manual was written by order of the Government of India. Specially intended for the use of Forest Officers in this country, it is certain nevertheless to commend itself to planters, for it contains a great deal of information of the highest utility to them. It is intended that the Manual shall treat of Building Materials, Building Construction, Road-making, Bridges, Transport of Timber, Wells, Construction of Embankments and Water Channels, River Training Works, and Demarcation of Forests. The first two items are discussed in the volume before us, the next two will form Vol. II., and the remaining sections will be dealt with in Vol. III. (the last of the series). A book of nearly 300 pages, comprising numerous illustrations, plans, etc., and dealing only with building materials and construction, must necessarily contain a great deal to interest planting readers. The last volume of the three will

be more in the way of a speciality for the Forest Officer. The first is a most useful compendium of hints regarding buildings, well arranged, copiously indexed and as free as possible from confusing technical terms. A brief outline of the heads into which the author divides his work will give a fair idea of the ground covered. We have gone through the book with some care and have satisfied ourselves that it is reliable as well as comprehensive.

Building Materials are so numerous that the author has had to divide his remarks on this subject into many sections. Stone; bricks; tiles; earth; grass and bamboos; lime; timber; Indian timber trees; preparations for preserving or beautifying words; and carpentry and joinery; these are the sections. The list shows the writer's desire to be "thorough." To show that this desire pervades the work under notice, we have only to cite an example. Under the head of bricks, we find very careful notes on the best kind of earth for use in brick-making, the mechanical analysis of earth, its preparation, the moulding, drying of the brick, together with useful hints on the quality of a really good brick. Under the head of "Tiles" we certainly miss our old friend the Mangalore variety, and we note that the pot and pan tiles described are those that are made in more Northern parts of India. This, however, by no means detracts from the value of the hints given. There is scarcely a sentence that does not apply, with very little modification, to the Madras Presidency, and the builder here can easily adapt to his own requirements the illustrations and the descriptions given. On the subject of Kilns, Mr. Rogers writes particularly well, and what he says should help readers to arrange for the cheap manufacture of good bricks in almost any of the planting districts. In certain localities, of course, suitable earth may not be available, but in such there is usually a supply of Stone, and in the book under review they are informed how to turn this material to good account.

The Construction of Buildings is a very wide subject, but Mr. Rogers starts at the foundations and leads us step by step to roofs; beyond these to lightning conductors, and eventually to estimates. Turn the pages over where we will there is sound advice; open it almost anywhere and we find a neat illustration, at the least, to make the letterpress thoroughly clear. There is a considerable amount of what we may term 'engineering detail,' for instance, as to the thickness of walls in relation to their height, the dimensions of roof trusses, etc. But everything is simple, everything clear; and any planter who wishes to build unto himself a house adapted to the golden days of a boom or one suited to the necessities of times of crises, or unto his coolies so many huts, may learn from Mr. Rogers how he should set about the work. The fixing of corrugated iron roofing sheets is as carefully explained as are the dimensions of roof trusses. Plans and estimates are gone into, in such a way that it almost seems easy to calculate the cost of a palace. That estimates are misleading is, however, proverbal; and planters would do well to apply to themselves the hint given by the author to Forest Officers:—"In the construction of Government works the Estimate should be a fairly lib one." It is always better to reckon the cost too high t too low, so that you may be at least sure of having fu enough to complete the erection of any building undertak No man who follows Mr. Rogers' instructions carefully very well fall into this error. In short, the book is what professes to be, a Manual, and a very useful manual, o subject, or series of subjects, with which every planter bound to have to familiarise himself sooner or later. would be difficult to commend it too strongly to the notice our readers.

TO THE DEAF.

A rich lady, cured of her deafness and noises in the head by *Dr. Nicholson's Artificial Ear Drums*, gave £5,000 to his Institute, so that deaf people, unable to procure the Ear Drums, may have them free.

Address—No. 989 D, The Nicholson Institute,
Longcott, Gunnersbury,
London.

Fiscal Federation.

The planters of India and Ceylon, backed by the Ind chambers of commerce, says the *Chicago Record*, are ask the West Indian colonies to support them in agitating for imperial fiscal federation for the protection of British agric tural and commercial interests against those of the rest of world,". . . The scheme seems rather a wild one, and is likely to commend itself to the British Government or British people at present. It might be carried out twe years hence, but it is decidedly ahead of public opinion to-d At the same time it is felt in these colonies that measures have to be taken to render the position of British comme more secure in regard to the mutability of foreign tari It is pointed out that, although it is possible the French G ernment may be induced to reconsider the action referred yet what has been already done serves as an unmistaka warning of the grave risk to which British trade is at pres exposed and the burdens it may at any time be called up to bear.

* * * *

Commerce says:—In connection with the duty on foreign colo produce, it may be useful to point out that the law of 24th February, 1900, providing for a maximum tariff upon fore colonial produce, has had an effect which the French were far f expecting. This effect has been to lead India, which hitherto not taken a very active interest in the commercial relations Great Britain and of the Empire generally with foreign countr to consider whether it would not be advisable for her to iden her attitude with that of Canada and to urge Great Britain towa a British Imperial Customs Union against the world. Suc Union is hardly what the French would desire, considering that t send to Great Britain one-third of their exports. Yet by their act in this matter of the Colonial produce duty they have clearly sh the British Colonies as a whole that the time has come for the Colo to consider whether the furtherance of their interests does require that they should make themselves independent of fore markets. A circular was received from one of the most powe trade Associations of India, the United Planters' Association Southern India, Madras, embodying a resolution adopted at t annual meeting held last August. This was as follows:—"T considering the critical condition of the tea and coffee industr this Association do communicate with the Indian Tea Associat the Ceylon Planters' Association, the Indian Chambers of C merce, and the leading firms of merchants and brokers interested tea and coffee, etc., in this country and in England and her Colo with a view to ascertaining whether a movement in favour commercial combination of Great Britain and her Colonies India against the world (which would by a system of differen duties afford some protection to British-grown products manufactures) would receive support." This resolution has b communicated by them to all Chambers of Commerce and c mercial bodies throughout the British Empire, and the co-opera

the Chamber was desired. It is felt that there is a strong and rowing feeling in England and her Dependencies and Colonies in vour of what may be termed an Imperial Fiscal Federation for e protection of British interests as against those of the rest of e world. Some difficulty having lately arisen as to the duty yable by an article imported from the United States of America d known as gluten meal, the matter was referred to the consulta- ve Committee. Under Note 318 of the tariff, articles of this scription are to be classed as oil-seed cakes provided they are to exclusively used as cattle food and cannot be utilised for distil- ng purposes or for starch-making, or for the manufacture of paste d glue. If the gluten meal is rich in fecula it is liable to the ty of maize. The Committee considered that, if the meal contains ore than 40 per cent. of fecula it can be utilised for industrial rposes, but that under that percentage it is only good as cattle od. They have, therefore, fixed at 40 per cent. the distinction tween gluten meal that is to be admitted as oil-seed cake free of ty and that which is to pay 3 francs per 100 kilos., or, with the rtaxe d'entrepôt, 6 francs 60 centimes per 100 kilos.

AMERICAN TEA.

Strenuous journalistic efforts are being made with a view getting Americans to take Dr. Shephard's tea-gardens riously. The American *Review of Reviews* is the last to ve a detailed account of the Pinehurst experiment and to rite as if it were but the beginning of a mighty American a-growing industry. One remark made is :—

"The question of labor has been dealt with quite as ilfully as the natural problems of heat and moisture ; and hile it still costs something like eight times as much to ave a pound of tea picked in South Carolina as the same ervice would demand in Asia, yet much of this comparative ss has already been balanced—and much more it is hoped ill soon be balanced—by greater productiveness in the eld by the substitution machinery for hand labor in the ctory, and by the manufacture of varieties of teas which, om inherent chemical causes, cannot be brought from the rient." Yet again we read :—"The practical results of ese ten trial years are before us, and tea culture on a usiness basis is an actuality in the United States. Already vals of the Pinehurst gardens are being inaugurated in a uiet way—one in Louisiana—another in South Carolina, a ird at the Georgia experiment station." The more the errier ! That is to say, the more American tea-gardens the reater the merriment of the tea planter in the East.

TEA.

A Specialist contributes to the *Ceylon Observer* some nsible remarks on "The Condition and Prospects of Tea." e does not believe in "resting" certain tea areas nor is he favour of curtailing the yield from estates on the lines laid own by the London Association. Neither of these schemes, ven if generally adopted, would be likely to ensure anything ore than temporary relief. A better plan, he says, would e for estates to *abandon outright* their unremunerative fields nd not allow them to be a burden on areas which can be rofitably cultivated, as they frequently are. The relief to e market, if some such plan as this were adopted, would be ery appreciable and it would rest on a thoroughly sound asis. "Abandoning" is obviously better than "resting." he latter would constitute a permanent menace to the enter- rise, making it difficult to sell estates, or shares in Companies, r who would invest in tea property if it were known that a large acreage of land was resting, waiting in fact in readiness for an improved range of prices to place its produce on the market? As regards plucking, his conviction is that careful plucking, as distinguished from *fine* plucking, is all that is necessary, and if continued, will very soon have an appreciable effect on the output. It may add to the cost of plucking a little, but a better class of tea will be produced. Great stress is laid upon the necessity for really wide-awake management of Estates.

NOTES.

Cinchona. The London Market is firm, price per unit being 1⅞d. Monthly sales, 1,600 packages.

Coffee in New Jersey. Out of 56 samples of coffee collected and analysed by the New Jersey State Dairy Commissioner, 7 were found to be adulterated.

Pepper at Havre. The importations of pepper in 1900 increased by 7,108 bags. It was nearly all from the French possession of Saigon, and enters France at 50 per cent. lower customs duty than pepper from India and Singapore.

Java Quinine. The exports from Java for October, 1900, amounted to 214 cases, of which 152 cases were shipped to the United Kingdom and the remainder to New York. From July 1 to October 31, 1900, the shipments were 1,039 cases, against 562 cases and 499 cases for the like period of 1899 and 1898.

Rubbish ! South India has been mentioned as a producer of rubbishy tea ; but the *Ceylon Observer* seems to think that Ceylon is a very big sinner in this matter. It asks :—"Can it be true that native dealers' stores in Nawalapitiya are at the present "chockfull" of refuse tea from estates in the upper districts, right away to Maskeliya, and that such tea after some sifting is being sent in bags to Colombo for sale?

Amsterdam Bark Market. At the bark auctions held on March 28th in Amsterdam, 6,899 packages, containing 624,980 kilogrammes of bark were offered. The quinine content of this reckoned as sulphate amounted to about 31,000 kilos. of which 27,867 kilos. sold, 24,756 kilos. in the form of manufacturers' bark, and 3,111 kilos. in the form of druggists' bark. The unit came out at 8·95 Dutch cents per half kilo. (about 1⅗d. per lb.), against 7·50 cents (about 1½d.) at the last auction.

The Indian Tea Season. Now that the season is closed the total export for 1900-1 is shown to be 184,793,188 lbs. Total quantity of Tea passed through Calcutta from 1st April, 1900 to 31st March, 1900 :—

	1900-1901	1899-1900.	1898-99.
Great Britain	160,753,157	149,374,164.	135,381,722
Foreign Europe ...	1,783,904	1,435,046	1,171,146
America	4,530,604	5,923,404	3,273,096
Asia	7,370,231	5,492,815	6,972,251
Australia	10,355,292	8,250,436	6,398,002
	184,793,188	170,475,965	153,196,217

Tea Inspectors.

An ex-Ceylon planter now in Southern India writes :—" I am with you entirely as to the advisability and even urgency of appointing an Expert Inspector of Teas for export. There is no doubt that the only way to stop the export of rubbish is for the 'King's Pipe' to be established in Colombo—and, it will be found, after a few 'fills' that the wherewithal will not be forthcoming to fill it. I wish only in India it were as easy as in Ceylon to set the ball a rolling." We always have our doubts about a man who thinks it easy for his neighbour to make a sacrifice, but difficult for himself to do likewise.

The London Coffee Market.

The *Produce Markets' Review* of 26th ultimo remarks :—In the terminal market quotations have further receded, influenced by the still excessive receipts, and it now appears almost certain that the current crop will total nearly 10½ million bags, instead of under 9 million, as originally estimated. As has been pointed out before, the advance in the exchange is a factor which must be taken into account, for the planters to-day are, as a result, getting materially less for their Coffee than when the price here was 6s. lower, and it is a question whether current rates will allow of the coming crop to be picked.

The India and China Tea Seasons.

The totals of exports from India and China, the season of the former being closed, present an interesting comparison. India has increased by nearly 11½ millions as against a 14 million increase the previous year—in her exports to Great Britain ; China however shews a decrease of over eight millions. But to the Continent China has sent over 10 millions as against 4 millions the previous year—India showing only 350,000 lbs. increase. To America, China has nearly seven million lbs. increase, India a drop of 600,000 lbs. To Australia, India has sent two million lbs. more than last year, an increase of 25 per cent. while China's increase is only 7 or 8 per cent. The proportion of Indian business to that of China is as 3 to 2—184,793,188 lbs. as against 122,461,494—for the season 1900-01.

Java Government Cinchona.

The report on the Government cinchona plantations in Java for the quarter ending December 31, 1900, states that the young plants are in excellent condition, and are developing strongly. This is due not only to the favourable weather during the period under review, but also to the fact that only healthy and large plants have been used for planting out. The plantations are free from disease and insect-pests, with the exception of those in the western part of Tirtasari, which are somewhat seriously affected. Contrary to recent experience, there has been a great lack of labourers, a fact which is also felt in private tea and cinchona plantations. By the end of December practically the whole output had been shipped, partly to Tandjong Priok (for export) and partly to the Bandong quinine-factory. The whole yield of bark in 1900 came to about 560 tons ; of this quantity 378 tons were exported to Holland, and 182 tons worked up at Bandong. At the auctions of cinchona-seed some specimens fetched as much as 46*l.* per packet of 25 grammes ; shoots for grafting were sold at 16s. 8d. each.

The London Tea Market.

The *Produce Markets' Review* of March 23, 1901. says :—The market has been active, and last week's prices have on the wh been well maintained. The low rates prevailing for the co mon descriptions having stimulated the export demand, considerably increased business has been transacted. As th appears every prospect of ample supplies, and a continuan of low prices, business in this direction bids fair to furth develop, and it is doubtful when the taste is more genera acquired for Indian and Ceylon Teas if consumers will retu to the use of other growths. Formerly, China Teas predon nated largely, in fact practically monopolised the export tra but from recent statistics this is almost entirely chang During the past eight months, *viz.*, to the end of Februa the exports of Indian and Ceylon Tea amounted to 18,508,0 lbs. as compared with 10,256,000 lbs. of other growths, wh for last month alone the figures respectively were 2,557,0 lbs. and 1,026,000 lbs., or considerably more than doub It appears evident, therefore, that British-grown Teas a fast displacing the China and other growths in forei markets, and should this increased demand continue it will much to take off the excess of the requirements in this mark

---

Fish Culture at the Crystal Palace.

Many planters will be interested the following note from the Lond *Times* :—An interesting experim in fish culture is being made at the Crystal Palace. I some time past trout have been hatched and reared in t aquarium from eggs received from various parts of t country, and the process of treatment from the time wh the eggs are placed in the hatching apparatus up to the f growth of the fish may be seen by visitors. The tanks co tain a number of fine two and three-year-old trout. T experiment of rearing them has been undertaken by t Crystal Palace Company for the purpose of ascertaini whether the trout will live in the stagnant water of the gr lake in the palace grounds. About 150 two-year-old rainb trout (*Salmo Iridens*) have just been taken from the reari tanks and placed in the lake. The number will be added from time to time, and it is hoped that the trout will thri as there are no jack in the lake. In course of time, if t experiment succeeds, fly-fishing will be introduced at Syde ham. Anglers in the district are taking great interest in t matter, and a joint Committee of various angling Clubs is course of formation with the view of protecting waters a of arranging conditions under which the trout will be fish for. It has been already agreed that for the first year all f hooked shall be returned to the water.

Tobacco in Ireland.

M. Lecornet, the expert employ to superintend the experiment tobacco culture in Ireland, reports of the trials of 1900 t the plots grown in the various districts show considera differences in their results. These are attributed to the ti of planting, the varieties grown, the care and experience b stowed upon the plants and the manuring of the plots, and t skill devoted to the gathering of the leaves. The planti was out, as a rule, much too late, a mischance that arose fr the careless handing of the first seedlings, which resulted their damping off. Exceptionally, however, the cultivat of the tobacco plant by Colonel Everard, at Randlestown, w quite satisfactory. The results in this case would, inde have been better still if the planting out had taken plac fortnight earlier with thoroughly vigorous seedlings, if t plants had been set closer together to improve the quality

tobacco, and if the manuring had been more intensive in
er to induce a more rapid growth. As it was, however,
1,800 plants raised at Randlestown gave 14,060 leaves, of
ch 3,320 were placed in the first class and 10,746 in the
ond class. The total weight of the dried leaves was
½ lbs., those of the first class weighing 96½ and those of
second class 255 lbs. These results are considered satis-
ory, in view of the fact that the varities tried—Havannah,
noca, and Kentucky—are very poor leaves of the
t class.

---

ee in B. C. Africa.

If British Central Africa be hardly able to hold its ground in the culti-
ion of coffee, remarks the *African Review*, it would seem
imed to talk of fostering other planting industries there,
we see that the question of tea production is receiving
ie attention. The general opinion of planters in the Shire
ghlands in regard to the cultivation of tea there is that,
lst other conditions are favourable, the rainfall is not
icient. In seeking to dispose of this idea, a tea planter,
ting in the *Central African Times*, points out that tea has
ider range of cultivation and can be grown under more
ied conditions of climate than any other product. Natal,
says, where tea has been successfully grown, has a similar
nfall to the drier parts of Nyassaland, and some of the
ia districts where tea pays well, have a very limited
nfall. In conclusion the writer says: 'Experience of
pical agriculture in other countries as well as here should
l one to the conviction that British Central Africa, judging
m its soil and climate, is more suited to be a tea than a
fee-producing country, chiefly because there is a very
ited area fit for coffee-growing. I see nothing to hinder
assaland from taking a place amongst the tea-producing
ntries of the world.' If the planters of British Central
ica decide to try tea-planting they may, in the opinion of
contemporary, rest assured that the consumption is likely
keep pace with the production, and that the price is not
ely to go below that which will yield a profit to the
tivator!

---

fee at Havre.

In his report for the year 1900 the British Consul remarks :—In my last
ort I referred to the anxiety caused to the coffee mer-
nts of Havre by a proposal of the Brazilian Government
apply their maximum tariff to French produce, an action
ich, if carried into effect, might have induced the French
vernment to increase the duty on coffee, which at that time
s 156 fr. (£6 4s. 9d.) per 100 kilos. (220 lbs). Negotia-
ns were entered into between the two countries, which
ulted in a *modus vivendi*, by the terms of which, in
urn for a reduction of the French duty from 156 to 136
(£5 8s. 9d.) per 100 kilos., the products of France would
ntinue to enter Brazil under the minimum tariff. At
present time the French minimum tariff of 136 fr. per
kilos. is applied to coffee from all foreign countries
cept Venezuela, in which country French goods are
jected to the maximum tariff. The importations from
azil in 1900 fell off by 550,551 bags, a quantity more than
f the total amount received from that country in 1899.
ere was an increase in the importations from the West
dies, Hayti, Central America, and India, but the amounts
ceived from those countries are small compared with the
portations from Brazil. The sails slightly increased, and the stock at the end of the year was less by 352,418 bags than the stock at the end of 1899. The decline in the importations is due to the fact that Havre was the market at which coffee was at the lowest price. The markets at Hamburg, Antwerp, Rotterdam, and Trieste were much higher than that of Havre, and the importers at those places could, therefore, afford to pay higher prices to the Brazilian shippers for coffee from Santos and Rio de Janeiro. Towards the end of the year prices at the other Continental markets were declining fast, but the Havre market still remained the lowest. It is estimated that about 90 per cent. of the coffee from Brazil, imported into Havre, is sold in the terminal market so as to insure against any sudden decline in the prices.

Destruction of Insect Pests.

The *Queensland Agricultural Journal* says :—" Those who have done some farming in the old country are well acquainted with the depredations caused there by the beetle called Cockchafer (*Melolontha vulgaris*). For three years it destroys crops from the roots under the form of a greedy white worm. Then, as a beetle or perfect insect, he harvests where he had sown. Many means have been recommended to destroy it, but none perhaps is more efficient than the one devised and used for the last ten years by the French Engineer M. Dibos. His apparatus is very simple. It can be made of an ordinary washing-tub, to which is attached a sort of funnel made either of sheet iron or simply of linoleum from 4 to 5 feet broad. The tub is half filled with water. From the middle of the tub emerges a sort of iron stand, ending in a candlestick on which is fixed a resin torch. Towards the evening the apparatus is placed amongst the trees in the orchard or in the field, and the torch lighted. The beetles fly in thousands round the light, getting burnt or blinded, and they fall straight into the water or on the sides of the funnel whence they roll down to the water. Thus from 10,000 to 12,000 are caught in a week—if the season lasts about three weeks, that means 36,000 insects destroyed every year. M. Dibos reckons that half of them (18,000) are females, each of which would have produced 40 eggs. He has thus prevented the formation of 720,000 insects, each of which would have destroyed 3d. worth of crop during the season. As the torch cost him only 3d. or 4d. per season, one can see at a glance that it pays to catch the beetles. The device seems well worth trying against the enemies of the orchards and crops of Queensland." There seems to be no good reason why it should not be tried also in India. It is at least a cheaper method than spraying with chemical preparations.

The Eureka Coffee Separator.

Cream Separators have come to stay. How about coffee separators? The *American Grocer* says of the Eureka Coffee Separator :—By the use of this machine six distinct grades of coffee are made—large, medium, and small flats, large and small peaberry, broken and unmatured. Where lesser grades are desired, blank screens are used. As there are so many different kinds of coffee, requiring different treatment, each machine is furnished with a full set of screens, all of which are interchangeable, thus enabling the operator to grade any class of coffee. Nothing but the best material enters into the construction of these machines, making them durable in all climates. The coffee is fed into the hopper of the machine and is distributed in an even stream into the suction leg by means of a feeding device of

an improved type. It is then acted upon by a powerful air current, controllable by valves. This air current removes all refuse, such as quakers, chaff, parchment, etc., the coffee going to the main screen in a perfectly clean condition. The coffee is divided on this screen for close grading. A portion goes to the screen in the first shoe and the balance to screens in the second shoe. What coffee tails over on the main screen is such as cannot be removed by air suction, and consists of sticks, shells, beans, and unhulled berries. The perforations on the main screen allow the small flats, small peaberry, and broken flats to go to the first shoe. Large and medium flats and large peaberry pass to the second shoe. The top grading screen of first shoe separates small peaberry; the second grading screen removes small flats. The broken parts pass through the bottom screen and are discharged from the machine at the bottom. The upper grading screen of the second shoe removes the large flats, the second screen the large peaberry, and the medium flats pass through the second screen and come out at the bottom, thus making all the grades clean, perfect, and distinct. Automatic travelling brushes are placed under each grading screen, keeping the perforations open, so that the screens can perform their work in an even and perfect manner.

GENERAL ARTICLES.

INDIAN TEA MARKET REVIEW, SEASON 1900-1901.

Messrs. Carritt & Co's Annual circular says :—

The season has closed with an actual crop of 187½ millions, of which 161 millions have been exported to the United Kingdom; the corresponding figures for last year were 174¾ and 149 millions respectively.

The quality of the crop has been indifferent. Some of the well-known marks have maintained their reputation for producing a high standard of quality, but Indian tea taken as a whole, has been poor, and appreciably inferior to the crops of several years past; this verdict is not an excuse for a low market; the crop has been over abundant and of an unusually low standard.

There has been nothing abnormal in the conditions of weather in the districts to account for the constantly disappointing quality coming forward, it is in a great measure explained by a freer system of manufactures and an anxiety to produce a crop of quantity rather than quality. The desire has by no means been universal, but it has undoubtedly overstepped the limit of prudence.

The movement in 1899-1900, when common tea was the centre of attraction and was indicative of an unusually active trade in the low grades, was deceptive and misleading and it was feared that this abnormal feature might have its effect in the immediate future. Our review on last year contained the following:—

"With the experience of the concluding season before them, there will doubtless be a tendency amongst growers to adopt a coarser system of plucking and there will be danger of this being overdone and the other extreme reached, *i.e.*, an over abundant supply of a *lower grade article* and a consequent great shrinkage in value."

The evils of a crop heavy in weight and low in quality have been aggravated by other causes beyond the control of those engaged in the Industry. Not only has the increased duty itself adversely affected consumption to a very serious degree, but the action of distributors at home, in anticipating it, was productive of a disorganised trade for several months to come.

It was estimated that the clearances out of bond during the budget scare in March last amounted to about 40 millions in excess of the *bonâ-fide* requirements of the trade; a burden which was carried by distributors and occupied their attention in working off probably as late as December. Of Indians it was all old season's tea and a few weeks later a fresh and cheaper supply was on the market.

The trade at home was therefore handicapped at the out set of the season; the distributors' dealings were hampered by heavy holdings of old tea, but their position was nevertheless an enviable one. They straightway raised the value of their teas throughout 2d. per lb., to correspond with the increased duty, and have since seen the price lower in Mincing Lane by almost an equal figure.

The position of the distributor, therefore, is one of prosperity. The producer, on the other hand, finds himself face to face with, at the best, an infinitesimal profit, or a heavy debit balance as a result of the last season's working.

So far as the actual working of concerns goes every possible economy has been strictly enforced, and the cost of production cannot be further reduced; a rigorous cutting down of expenditure which in some measure may have assisted in swelling the outturn at the expense of quality, became compulsory and producers are now forced to look in other directions for the bettering of their interests.

It has been unmistakably shown that with the increase of 50 per cent. in duty, consumption has been unable to keep pace with production; an unprecedently low price has not resulted in any appreciably increase in the offtake, and stocks have rapidly accumulated. The sacrifice of quality for quantity at this juncture has reacted to the disadvantage of the producer It has weakened his hand against the distributor and brought down the standard of quality to a level of value that does not cover cost of production on a large proportion of the crop. Producing interests have recognized that something must be done and an agitation is now on foot for the restriction of outturn from both India and Ceylon during the ensuing season.

Several schemes with this object in view have been suggested, all more or less worthy of careful consideration; but a common agreement whereby a smaller crop of improved standard of quality would be ensured, is undoubtedly the wisest. In other words, the plucking area should remain the same, but it should be covered at shorter regular intervals and the leaf taken off at an earlier stage of growth. By abandoning a certain proportion of the yielding area no improvement in quality is likely to follow and a reduced outturn would be the sole result. The former would doubtless cost more, but the desired end would be more easily and expeditiously achieved by giving the trade a smaller crop of improved quality than one of similarly indifferent, or possibly inferior standard to that produced last season.

So far the industry has not the record of being a homogeneous body, but there should be no difficulty in bringing this about under existing circumstances. A combined action of some sort or other is absolutely necessary. Similar combinations have culminated to the advantage of producers in other industries and if the give-and-take principle is observed and united action assured, an improved position would soon be manifest.
